PREFACE

AGAIN this year, as in past years, the NEW INTERNATIONAL YEAR BOOK presents the developments in all major lines of human activity throughout the globe. The connected story for 1939 is within these pages. The files of last year's newspapers, news weeklies, journals, bulletins, and reports have been culled and assembled so as to miss no important statistical, political, legislative, or historical event in any State or in any nation of the world; to cover every major development in science, art, religion, law, sports, agriculture, business, and so on; to report all notable aims in all phases of sociology; to record the year's contributions in the literature of the leading languages of Europe and the Americas, and so on and on.

Though the shadow of the European War is seen upon almost every page in this record, it may be that the most important event of the year to the nations of North and South America was the meeting of a few score men last autumn in Panama City. Whatever the outcome of the European struggle, it is certain that years will pass before normal trade can be resumed between the Eastern and Western Hemispheres. The Americas will be forced into closer relations, and, it may well be, into closer cultural relations. The Panama Conference of September-October, with official representatives from 21 American nations participating, was a long stride toward the consummation of such ends, though the immediate purpose of the Conference was to devise effective means to preserve the neutrality of the western nations from the European imbroglio that threatened the entire world.

Naturally, in every mind during 1939 were the prospects of war in Europe, and, when it did come, its successive operations on land and sea and the subsequent involvement of Finland and Russia. Military matters have therefore been transcendent and have, accordingly, received special treatment in the YEAR BOOK. Hanson W. Baldwin, military and naval correspondent of *The New York Times*, in his article, EUROPEAN WAR, has covered every development of the conflict itself, while the internal affairs and diplomatic proceedings of the countries involved are properly reported within the historical treatment of each of the nations. Maps and illustrations, in greater number than in previous years, accompany these articles and show, among other things, the fronts upon which fighting occurred, the conditions under which modern warfare is conducted, and the devastating results of such warfare, and the prominent military leaders and statesmen of 1939. Military progress, covering the armies of the world, is presented by Major R. Ernest Dupuy, U.S.A., and Captain C. H. McMorris, U.S.N., describes the status of the navies of the world. The effects of the war itself upon the United States can not help but be reflected in almost every topic herein, from art to zoology, for it has by no means confined its tentacles to the few nations actually involved; but, as bringing the war closer home, the articles NEUTRALITY, WAR RELIEF, and various sections under BUSINESS and FINANCE, will be of particular interest.

No sooner had Poland been occupied in September than was the refugee problem vastly magnified. Not only was the plight of the Jews made more desperate, but also Polish nationals were added to Czechs, Spaniards, and others whom war and political machinations had driven from their countries. The Jewish situation as it was in 1939 is described separately this year by Marvin Lowenthal, while the larger aspect of the entire problem of the refugee, both Jewish and political, and the steps toward solving it are discussed by Myron C. Taylor, who represents the United States on the Intergovernmental Committee on Political Refugees and by James G. McDonald, former High Commissioner, of the League of Nations, for Refugees Coming from Germany.

Many new names have been added to our list of contributing editors, all selected with an aim to establish even greater authority in the presentation of information than the YEAR BOOK has previously enjoyed. The new contributors are too numerous to justify separate mention here, but are named upon the immediately following pages along with other contributing and staff editors. Also, many new topics are presented this year for the first time, some necessitated by special requirements of the year, and others which the present editor believes to be of such importance as to warrant annual presentation. Among the latter are, especially, those relating to newly expanding phases of commerce and industry.

Other modifications effected in this issue are, (1) full coverage of the major Federal agencies, in most cases presented by the head of each such agency; (2) an increased scope in the realm of education, with an outstanding résumé by Dr. Charles Hubbard Judd as the feature; (3) specific emphasis upon labor and labor conditions, with the review, national and international in scope, by William M. Leiserson as the core, as well as individual articles by William Green and John L. Lewis to present the activities and aims of the organizations which they head.

The reader will also note that certain material of steady interest has been grouped into lists; as, AMBASSADORS AND MINISTERS of and to foreign countries; ARMAMENTS OF THE WORLD; BROADCASTING STATIONS of 50-KW or more; MANDATED TERRITORIES; MEMBERS OF CONGRESS; RELIEF EXPENDITURES; RELIGIOUS ORGANIZATIONS.

PREFACE

It is doubtful if one could point to a single feature in the book and say "That article deserves first consideration." A physician would proclaim that Dr. Cochran's review of *MEDICINE AND SURGERY* should be read by every doctor in the country; a criminologist would vote for Mr. Bennett's article on *PRISONS AND CRIME CONTROL*; a business man or banker would say that Dr. Bogen's *BUSINESS REVIEW* was the clearest analysis of the effect of the European War on business that he had seen; while the teacher of current history and the economist would again select Mr. Kain's masterly summaries of the nations of the world and Mr. Coan's reviews of each of our own States and of the United States as a whole.

The editor can not close without acknowledging his deep gratitude to each of the members of his staff, without whose hearty co-operation the many improved features in the Annual could scarcely have been successfully accomplished. Especially he extends his thanks to Mr. Ronald S. Kain, Miss Mamie Harmon, and Miss Helen Ready Bird, who shared with him the heavy task of redesigning the *YEAR BOOK* and who have been equally unremitting in the effort to attain the goal set for it. Though he is indebted to a number of Federal bureaus or their representatives for statistical and other material, he acknowledges a special debt to Mr. Louis Domeratzky, Chief of the Division of Regional Information, Department of Commerce, for the invaluable co-operation of his office in supplying statistical information upon foreign nations. He also wishes to thank those of the former contributing editors who cheerfully accepted the suggestions that were made toward bringing this Annual into more perfect balance, and he is certain that the reader will also welcome the many new contributors to this issue.

KEY TO PRONUNCIATION

ā as in *ale, fate*. Also see **ē**, below.
â " " *senate, chaotic*.
ā " " *glare, care, and as e in there*. See **ē**, below.
ā " " *am, at*.
ā " " *arm, father*.
ā " " *ant, and final a in America, armada, etc.*
 In rapid speech this vowel readily becomes more or less obscured and like the neutral vowel or a short *u* (**ū**).
a " " *final, regal, where it is of a neutral or obscure quality*.
ā " " *all, fall*.
ē " " *eve*.
ē " " *elate, evade*.
ē " " *end, pet*. The characters **ē**, **ā**, and **ā** are used for **ā**, **ae** in German, as in Baedeker, Gräfe, Händel, to the values of which they are the nearest English vowel sounds. The sound of Swedish **ā** is also sometimes indicated by **ē**, sometimes by **ā** or **ā**.
ē " " *fern, her, and as i in sir*. Also for **ō**, **oe**, in German, as in Göthe, Goethe, Ortel, Oertel, and for **eu** and **œu** in French, as in Neufchâtel, Crèvecoeur; to which it is the nearest English vowel sound.
e " " *agency, judgment, where it is of a neutral or obscure quality, ē*.
ī " " *ice, quiet*.
ī " " *quiescent*.
ī " " *ill, fit*.
ō " " *old, sober*.
ō " " *obey, sobriety*.
ō " " *orb, nor*.
ō " " *odd, forest, not*.
o " " *atom, carol, where it has a neutral or obscure quality*.
oi " " *oil, boil, and for eu in German, as in Feuerbach*.
ōō " " *food, fool, and as u in rude, rule*.
ōō " " *foot, wool*.
ou " " *house, mouse*.
ū " " *use, mule*.
ū " " *unite*.
ū " " *cut, but*.
u " " *full, put, or as oo in foot, book*. Also for **ū** in German, as in München, Müller, and **u** in French, as in Buchez, Budé; to which it approximates in English.
ū " " *urn, burn*.
y " " *yet, yield*.
ɸ " " *the Spanish Habana, Córdoba, where it is like a v made with the lips alone, instead of with the teeth and lips*.
ch " " *chair, cheese*.

d as in the Spanish Almodovar, pulgada, where it is nearly like *th* in English then, this.
g " " *go, get*.
g " " *the German Landtag, and ch in Feuerbach, buch; where it is a guttural sound made with the back part of the tongue raised toward the soft palate, as in the sound made in clearing the throat*.
h " *j* in the Spanish Jijona, *g* in the Spanish gila; where it is a fricative somewhat resembling the sound of *h* in English hue or *y* in yet, but stronger.
hw " *wh* in which.
κ " *ch* in the German ich, Albrecht, and *g* in the German Arensburg, Mecklenburg; where it is a fricative sound made between the tongue and the hard palate toward which the tongue is raised. It resembles the sound of *h* in hue, or *y* in yet; or the sound made by beginning to pronounce a *k*, but not completing the stoppage of the breath. The character **κ** is also used to indicate the rough aspirates or fricatives of some of the Oriental languages, as of *kh* in the word Khan.
ŋ " *in sinker, longer*.
ng " " *sing, long*.
ɴ " " *the French bon, Bourbon, and m in the French Étampes; where it is equivalent to a nasalizing of the preceding vowel. This effect is approximately produced by attempting to pronounce "onion" without touching the tip of the tongue to the roof of the mouth. The corresponding nasal of Portuguese is also indicated by ɴ, as in the case of São Antão*.
sh " " *shine, shut*.
th " " *thrust, thin*.
th " " *then, this*.
zh " *z* in *azure*, and *s* in *pleasure*.
 An apostrophe ['] is sometimes used to denote a glide or neutral connecting vowel, as in *tā'b'l* (table), *kāz'm* (chasm).
 Otherwise than as noted above, the letters used in the respellings for pronunciation are, to receive their ordinary English sounds.
 When the pronunciation is sufficiently shown by indicating the accented syllables, this is done without respelling; as in the case of very common English and other words which are correctly accented. Pronunciation is discussed fully in THE NEW INTERNATIONAL ENCYCLOPEDIA and in the NEW STANDARD DICTIONARY.

THE NEW INTERNATIONAL YEAR BOOK

AAA. AGRICULTURAL ADJUSTMENT ADMINISTRATION (q.v.).

ABBOTT, GRACE. An American social worker, died in Chicago, Ill., June 19, 1939. Born in Grand Island, Neb., Nov. 17, 1878, educated at Grand Island College (Ph.B., 1898; LL.D., 1931), attended the University of Nebraska during 1902-03, and received the degree of Ph.M. in political science at the University of Chicago (1909). She taught for a few years in the Grand Island High School until 1907, when she went to Chicago and became director of the Immigrants' Protective League and a resident worker at Hull House (1908-15). From 1910 to 1917 she was a member of the faculty of the Chicago School of Civics and Philanthropy, and during 1913-14 also served as executive secretary of the Massachusetts State Immigrants' Commission.

In 1917 she was appointed by President Wilson director of the newly-created child labor division of the Children's Bureau to administer the Child Labor Law. When this law was pronounced unconstitutional and her position was abolished, she remained in Washington as an adviser to the War Labor Policies Board (1918) and as secretary of the Child Welfare Conference called by the Children's Bureau at the request of the President in 1919. During 1920-21 she was executive secretary of the Illinois Immigrants' Commission. In 1921 President Harding appointed her head of the Children's Bureau, where she remained until her resignation in 1934 to become professor of public welfare and editor of the *Social Service Review* at the University of Chicago.

Miss Abbott was a pioneer in the fight for the child labor amendment and for social security legislation and she labored constantly to decrease infant and maternal mortality and juvenile delinquency. In 1923 she became the United States member of the advisory commission of the League of Nations on traffic in women and children, and in 1924 was president of the National Conference of Social Work. Also, she was a government delegate to the International Labor Conferences (1933, 1937) and headed the delegation in 1938. Besides many honorary degrees, she received the gold medal of the American Social Science Association, and was named one of the 12 outstanding women of America in a poll conducted by *Good Housekeeping* in 1931. In 1935 *Parents Magazine* awarded her its gold medal. The editor of many of the publications of the Children's Bureau and a contributor to magazines, she was the author of *The Immigrant and the Community*

(1916) and an authoritative work entitled *The Child and the State* (2 vol., 1938).

ACADEMY, FRENCH (ACADÉMIE FRANÇAISE). The oldest of the five academies which make up the Institute of France and officially considered the highest; founded in 1635. The membership is limited to 40. The list of the Immortals in 1939, in order of their election, was as follows: Gabriel Hanotaux; Henri Lavedan; Maurice Donnay; Marcel Prévost; Henri Bergson; Mgr. Alfred Baudrillart; Henri Bordeaux; André Chevrillon; Georges Goyau (q.v.); Édouard Estaunié; Georges Lecomte; Émile Picard; Louis Bertrand; Auguste de Caumont, Duc de la Force; Paul Valéry; Abel Hermant; Émile Mâle; Louis Madelin; Maurice Paléologue; Marshal Henri Pétain; André Chaumeix; Gen. Max Weygand; Pierre Benoit; Abel Bonnard; François Mauriac; Maurice, Duc de Broglie; Léon Bérard; Marshal Louis Franchet d'Espèrey; Claude Farrère; André Bellessort; Georges Duhamel; Louis Gillet; Edmond Jaloux; Joseph de Pesquidoux; Lucien Lacaze; Mgr. Georges Grete, Bishop of Le Mans; Jacques de Lacretelle; Charles Maurras; André Maurois; and Jérôme Tharaud.

ACADEMY OF ARTS AND LETTERS, AMERICAN. A society founded in 1904 by members of the National Institute of Arts and Letters for the purpose of furthering and representing the interests of literature, painting, sculpture, architecture, and music. Its membership is limited to 50 chairs, vacancies caused by death being filled by elections from the membership of the Institute.

The membership of the Academy as of Nov. 16, 1939, consisted of the following in the order of their election: George de Forest Brush, Bliss Perry, Abbott Lawrence Lowell, Nicholas Murray Butler, Herbert Adams, Robert Grant, Hamlin Garland, Archer Milton Huntington, Newton Booth Tarkington, Charles Dana Gibson, Royal Cortissoz, Charles Downer Hazen, Wilbur L. Cross, Hermon A. MacNeil, James Earle Fraser, John Huston Finley, William Mitchell Kendall, Edwin Markham, Robert Frost, James Truslow Adams, William Lyon Phelps, Adolph Alexander Weinman, Walter Damrosch, Anna Hyatt Huntington, Paul Manship, Cecilia Beaux, Eugene O'Neill, Henry Dwight Sedgwick, Walter Lippmann, Frederick J. E. Woodbridge, M. A. de

Wolfe Howe, Frank Jewett Mather, Jr., Stewart Edward White, Deems Taylor, Charles McLean Andrews, Van Wyck Brooks, Herbert Putnam, Jonas Lie, William Adams Delano, Charles Warren, Bernard Berenson, Frederick Shepherd Converse, Chauncey Brewster Tinker, Albert Spalding, Sinclair Lewis, Willa Cather, Stephen Vincent Benét, Ellen Glasgow, and Thornton Wilder.

From November to May of each year the Permanent Museum and the Art Gallery of the Academy are open and free to the public from 10 a.m. to 5 p.m. on week days and from 2 p.m. to 5 p.m. on Sundays. In the 1939-40 season a special exhibition of the works of Childe Hassam and Edwin Austin Abbey, former members of the Academy, were being shown.

All Officers and Directors of the Academy were re-elected for 1939-40. They are: President, Nicholas Murray Butler; Chancellor and Treasurer,

Occupational deaths by industry for 1938 were as follows: Agriculture accounted for 26 per cent of all occupational deaths; trade and service, 24 per cent; construction, 17 per cent; transportation and public utilities, 12 per cent; manufacturing, 12 per cent; mining, quarrying, and wells, 9 per cent. More important, however, is the rate by work-hours and in this respect lumbering proved the most dangerous occupation with 46.38 disabling injuries per 1,000,000 man-hours. Next in order were mining, meat packing, construction, and refrigeration. Hands and fingers were involved in the greatest number of work accidents, 33 per cent, legs and feet in 24 per cent, the trunk in 19 per cent, and the arms in 11 per cent.

Wilbur L. Cross; Secretary, William Lyon Phelps; Directors: Herbert Adams, Royal Cortissoz, Charles Dana Gibson, Robert Grant, Charles Downer Hazen, Archer Milton Huntington, and William Lyon Phelps. Administrative offices are at 633 West 155th St., New York City.

ACCIDENTS. According to a preliminary report released by the National Safety Council, the total number of deaths from accidents in the United States was 93,000 in 1939, a decrease of 1 per cent from the final figure of 93,805 for 1938. This represented a cumulative decline of 15 per cent in the last three years. Deaths from burns showed the greatest increase over 1938 (8 per cent) but drownings decreased sharply. The estimated cost of all accidents, including wage loss, medical expense, and property damage, was \$3,300,000,000. The accompanying table shows recent comparative statistics.

In connection with its 1938 reports the National Safety Council revealed certain highly significant facts. It was pointed out that only two types of accidents account for more than half the accidental deaths in the country: Motor vehicles cause 34 per cent, and falls, 28 per cent. Next in importance are drowning and burns, 8 per cent each, railroad accidents, 5 per cent, firearms, 3 per cent, and poisons and poison gases, 2 per cent each. For persons under 25 the accident rate reaches a definite peak in the summer, which is not the case with persons over 25. Accident rates are higher in the West and in Florida than in other parts of the country, and the rates vary in individual States from 38.9 per 100,000 population in North Dakota to 185.8 in Nevada. For the entire population, accidents constitute the fourth most important cause of death, being exceeded only by heart disease, cancer, and pneumonia. Accidents rank second as the cause of death in males and only sixth in the case of females.

ADELPHI COLLEGE. A nonsectarian college of liberal arts for women located in Garden City, New York, incorporated in 1896. Adelphi was situated in Brooklyn, New York, until the autumn of 1929 when it moved to its present location in Garden City, where it has a campus of about 70 acres and three buildings. The enrollment for the autumn term of 1939 was 491 and for the summer session of 1939 was 108. The faculty numbered 51. The endowment was \$43,151, while the income for 1938-39 was \$196,670. The Library contained 32,804 volumes. President, Paul Dawson Eddy, A.M.

ADEN. See under ARABIA.

ADULT EDUCATION, AMERICAN ASSOCIATION FOR. A membership organization founded in 1926 for the purpose of furthering the idea of education as a continuing process throughout life. During the last decade the Association has served as a clearinghouse of information concerning adult education activities; has assisted enterprises already in operation; has helped organizations and groups to initiate activities; and has conducted or sponsored studies and demonstrations. Nearly 100 books and pamphlets on methods and practice in adult education have been published by the Association or issued under its sponsorship. The *Annual Report of the Director of the Association* is published in May of each year; the *Journal of Adult Education* (the official organ of the Association) is issued in October, January, April, and June. Support for the activities of the Association has been derived from membership fees and from grants made by the Carnegie Corporation of New York. See LIBRARY PROGRESS.

In 1936 the Association embarked on a program of studies in the social significance of adult education in the United States in order to discover the meaning and to estimate the work of adult education as a social movement among the other

social movements. The publication of volumes in this series has continued, but in 1939 the Executive Board of the Association decided that the national and international emergency following the outbreak of war in Europe called for a temporary curtailment of the study program in order to allow the Association to proceed on an enhanced scale with experimentation, demonstration, organizational promotion of adult education opportunities, and research in the preparation of materials for study at every adult level.

Studies in the social significance of adult education published in 1939 dealt with education in museums, health organizations, churches, and agricultural extension; those planned to complete the series will deal with elementary education of adults, university extramural relations, adult education councils, and training programmes for adult education teachers and leaders.

The 1939 annual meeting was held in May at Niagara Falls, Canada. The following officers were elected: Alvin Johnson, president; James E. Russell, honorary chairman; Everett Dean Martin, chairman; Alexander Meiklejohn, Charles E. Rush, Elmer Scott, John W. Studebaker, Henry M. Wriston, vice presidents; Jennie M. Flexner, secretary, and Harold Stonier, treasurer. Headquarters: 60 East 42d St., New York City. Director, Morse A. Cartwright.

ADVANCEMENT OF SCIENCE, AMERICAN ASSOCIATION FOR THE. An organization founded in 1848 to advance science, to give a stronger and more general impulse and systematic direction to scientific research, and to procure for the labors of scientific men increased facilities and wider usefulness. On Sept. 30, 1939, its membership included 20,194 co-operating individuals. As a general association of the numerous American societies for the advancement of the special sciences, it consisted of 170 autonomous and independent associated scientific societies, 32 being local academies of science.

The Association holds two meetings during the year, one in the summer, and the regular annual meeting in December. The last summer meeting was held in Milwaukee, June 19-24, 1939, with an attendance of about 900.

The next meeting, the 105th, was held in Columbus, Ohio, Dec. 27, 1939 to Jan. 2, 1940. Although the registered attendance was about 2700, it is estimated that approximately 5500 were in attendance at the various sessions. About 40 affiliated and associated organizations met with the Association, together with its 15 sections in connection with the Columbus meeting. Of the 2150 papers presented at the various sessions of the sections and societies, the prize of \$1000 for describing a noteworthy contribution to science was awarded to Dr. I. I. Rabi, of Columbia University, for a paper on "Radio Frequency Spectra of Atoms and Molecules." At this meeting, Dr. Albert B. Sabin, now with the Children's Hospital Research Foundation, Cincinnati, Ohio, read his paper on "Constitutional Barriers to Involvement of the Nervous System by Certain Viruses," for which he received the Theobald Smith Award in medical sciences consisting of a bronze medal and a prize of \$1000. See GEOLOGY.

The official organ of the Association is the weekly journal, *Science*. In addition it issues *The Scientific Monthly*, an illustrated magazine of timely articles of general interest by eminent men of science. The permanent endowment of the Association, the income from which is em-

ployed to advance scientific research, amounted on Sept. 30, 1939 to about \$254,041.

The president of the Association for 1939 was Dr. Walter B. Cannon, Harvard University. The president-elect for 1940 is Dr. Albert F. Blakeslee, Carnegie Institution of Washington, Cold Spring Harbor, N. Y. The other officers for 1940 are: General secretary, Otis W. Caldwell; treasurer, John L. Wirt; permanent secretary, F. R. Moulton. Headquarters are in the Smithsonian Institution Building, Washington, D. C.

ADVENTISTS. In America the Advent Movement owed its origin to William Miller (1782-1849), who taught that Christ was coming in person and that the date might be fixed with some definiteness. According to the Year Book of American Churches, there are four Adventist Bodies, which had a combined membership of 187,100 in 1938. The largest denomination is that of the Seventh Day Adventists, who believe that Saturday is the Sabbath established by God's law. Headquarters, Takoma Park, Washington, D. C. See RELIGIOUS ORGANIZATIONS.

ADVERTISING. When a business man decides to expand his advertising there is always an interval of preparation before the advertisements appear. So although the year 1939 was a good year for Advertising, its increases as usual followed by several months the rising temperatures of general business as they were shown in the statistical thermometers. Much of the optimism shown in business statistics in the last four months of 1939 will find truer reflections in the volume increases of 1940 advertising.

Slight rises in volume were shown in magazines and in newspapers. Outdoor advertising just about held its own, while farm papers showed a small loss. Radio was the only medium which enjoyed a substantial gain, estimated at as much as 17 per cent.

Interest in the European situation sent the sales of receiving sets to an all-time high of 9,100,000 in 1939. Nearly a million of these were the new portable sets fitted with batteries. This was also the first year of the so-called micro-midget receivers—small enough to hold in the palm of the hand. Well over a million receiving sets for automobiles were sold, so that now one out of five cars on the road is radio-equipped.

There were no great discoveries of new personalities on the air in the past year. "Idea programs" continued to flourish, especially variations on the quiz theme. The only new factor was a radio application of the national craze for bank-night. An ingenious use of telephone numbers brought huge audiences to their receiving sets in all parts of the country to hear which lucky individual among millions of listeners would get a random cash award.

Women's clubs met to condemn horror-shows and to eulogize the sponsors of classical music. A few hundreds of thousands quietly appreciated the bountiful fare of excellent musical and dramatic free entertainment which makes the American system of broadcasting, for all of its vulgarities, the most sumptuous in the world.

Advertising and the Consumer have been doing business together quite happily for several generations, but the year 1939 found the Consumer discovering Advertising anew and Advertising discovering the Consumer. Each looked at the other with new and appraising eyes. On the whole the experience has been wholesome for both.

So much for the statistical record. But advertising is more than facts and figures. It is a shifting parade of personalities, ideas, issues, and conflicts of opinions. For instance:

The year 1939 was only a few days old when Kenneth Collins resigned from the vice-presidency of Gimbel Brothers to become assistant to the publisher of the *New York Times*, when President Lohr of the National Broadcasting Co. announced his opposition to liquor advertising on the air, when the late Heywood Broun called a strike of his American Newspaper Guild on two Hearst newspapers.

Ken, the unfortunate offspring of the publishing wizards who had astonished the advertising world with *Esquire* and *Coronet*, made its last struggle for public favor by changing its style of format and content before it finally disappeared completely.

As the year progressed business men engaged in the food and drug fields journeyed to Washington to begin a long series of conferences looking toward the revision of labeling regulations. William J. Wardall, as trustee for the McKesson & Robbins situation, patiently continued his efforts to straighten out the post-Musica confusion.

The Harvard Bureau of Business Research studied 42 food co-operatives, 47 general store co-operatives, 160 farmer co-operatives dealing mostly in farm supplies and petroleum products, and decided that any advantage over comparable private enterprises lay mostly in their distribution of retail profits, in scrupulous labeling, in benevolent pricing, but not in greater operating efficiency.

The soft drink industry was suddenly discovered by Wall Street, mostly because two growing competitors of the national leader in the cola field produced unusual records of earnings.

Researcher Daniel Starch, whose minions carry magazines to sample groups of readers to ask them what they have seen and what they have read, altered his methods for greater accuracy.

Scribner's Magazine, one of the landmarks of publishing, quietly found the struggle too difficult and in its fifty-third year suspended. The Crowell Publishing Company produced a series of remarkable advertisements in which the heads of conspicuous companies were photographed with inquiring consumers. The series was noteworthy not only because it frankly raised questions occurring to consumers about advertising, but because executives like William Knudsen of General Motors, Clarence Francis of General Foods, and Gerard Swope of General Electric were photographed and quoted directly in explaining the fundamentals of Advertising.

The newspapers of the country, disturbed by the progress of other media, co-ordinated their efforts to renew an appreciation of newspapers as a basic advertising medium. Astonished by the growth of cans as containers for beverages, the glass people brought out a thinner, lighter, no-deposit bottle.

A group of consumers appeared before the Temporary National Economic Committee to ask that Advertising have less glitter and more facts, and that sales clerks know more about what they were selling.

In Rochester a stamp plan under the Department of Agriculture found success in moving merchandise to relief householders without disturbing the channels of regular business. More publications intended to guide the consumer in purchasing came into existence without substan-

tial proof of their reliability, Mrs. Franklin D. Roosevelt was photographed in a plane to encourage the timid to fly, and the chain stores and Wright Patman continued to make news.

The Federal Trade Commission and *Good Housekeeping Magazine* locked horns in the first of a series of hearings which developed into an acrimonious conflict. The approval of the Good Housekeeping Institute met with questioning, and the magazine's top man, Richard E. Berlin, replied with outraged charges of subversive influences.

Dupont put on the market its first trial of Nylon-made stockings and 4000 pairs were sold in the first day. *Look's* eye camera, developed by Dr. Herman F. Brandt of Drake University, produced its first results showing that pictures of greater mass have greater attraction power, higher visibility, and greater interest retention power. Advertisers pondered the significance of learning for the first time what actually occurs when a reader opens a publication.

Ted Patrick, famed for his World Peaceways advertisements, turned his guns on propaganda for neutrality. RCA continued its explorations of television and discovered that its technicalities could be mastered far more easily than its economic implications.

Charlie McCarthy announced his intention of dropping from a full hour to a half hour for Chase & Sanborn, and the radio world was shaken with news of a new network with Elliott Roosevelt's name prominently coupled with various large advertisers—but nothing came of it.

Three hundred and forty-two advertisers, according to *Printers' Ink*, invested more than \$100,000 each during 1939 in magazines, farm publications, and radio combined. Procter & Gamble, General Foods, General Motors, Sterling Products, Lever Brothers, Colgate Palmolive-Peet, American Tobacco Co., Campbell Soup Co., Chrysler, Liggett & Myers, R. J. Reynolds, and Standard Brands stood at the top of the list. See also CO-OPERATIVES, and MARKETING; FASHION.

ROY S. DURSTINE.

ÆGEAN (ê-jě'an) ISLANDS, ITALIAN.

The islands in the Aegean sea, near Turkey in Asia, belonging to Italy. They comprise (Italian names in parentheses) Rhodes (Rodi), Castellorosso (Castellorizo), and the Dodecanese group—Astypalaea (Stampalia), Casos (Caso), Cos (Coo), Kalymnos (Calino), Karchi (Calchi), Karpathos (Scarpanto), Leros (Lero), Lipso (Lisso), Nisyros (Nisiro), Patmos (Patmo), Symi (Simi), Tilos (Piscopi). Total area, 1035 square miles; total population (1936), 140,848 (natives, 85 per cent; Italians, 12 per cent). Chief towns: Rhodes (capital), 27,466 inhabitants (1936); Kalymnos (Calino), 15,247. Education (1937-38): 12,569 pupils in elementary schools and 865 pupils in secondary schools.

The chief agricultural products consist of grapes, olives, tobacco, oranges, and vegetables. Oriental carpets, wine, olive oil, pottery, and tiles are manufactured. Sponge fishing is an important industry. Livestock (1937): 90,695 goats, 66,546 sheep, 8978 horses, asses, and mules, 6519 oxen, and 3934 pigs. In 1937, imports were valued at 122,374,000 lire; exports, 19,705,000 lire (lira averaged \$0.0526 for 1937 and 1938). Budget (1934-35): 48,000,000 lire including a state contribution of 3,000,000 lire (lira averaged \$0.0825 for 1935). There were, in 1938, 391 miles of highways. The

Italian navy has a station at Rhodes and a base at Leros. A governor, who is subject to the Italian Foreign Office in Rome, heads the administration. Governor, Count de Vecchi.

AERIAL PHOTOGRAPHY. See PHOTOGRAPHY, GEOLOGICAL SURVEY.

AERONAUTICS. Individual Exploits. In a year in which military and transport flying played the major role, the several good-will flights and attempts at new records were of a secondary importance in stimulating aeronautical progress.

Completing the largest mission to South America in the last decade, seven Army Air Corps Boeing B-17 Flying Fortresses arrived in the United States on November 26. Celebrating the 50th Anniversary of the Republic of Brazil, the flight was headed by Maj. Gen. Delos C. Emons, GHQ Air Force commanding general; 29 officers, and 28 enlisted men participated. The 12,000 miles were flown at an average speed of a little over 200 miles per hour.

In reciprocation for a good-will flight to Mexico City made by Capt. E. V. Rickenbacker, Francisco Sarabia on May 24 set a new time record for the 2350 miles from Mexico City to Floyd Bennett Field, N. Y. Flying a *Gee Bee* special, Sarabia covered the distance in 10 hours, 47 minutes, breaking the previous record set by the late Amelia Earhart on May 8, 1935, of 14 hours, 19 minutes. Beginning his return flight Sarabia was killed on June 7 when his plane crashed at Washington, D. C.

Both Russia and Japan inaugurated good-will flights during the year. The Russian flight from Moscow to New York ended 700 miles short of New York, on Miscou Island, New Brunswick, when Brig. Gen. Vladimir Kokkinaki and Maj. Mikhail Gordienko were forced down on April 28. In their plane, the *Moscow*, a 1936 model with two 1000 h.p. engines, the Russian airmen left Shcholkovo Airdrome on April 27. The flight was terminated, according to Brig. Gen. Kokkinaki, because of the lack of reliable weather information between New York and the coast of Labrador.

The Japanese plane *Nippon*, a twin-motor transport monoplane built by the Mitsubishi Heavy Industry Corporation, left Tokyo on August 28. Carrying six aviators and a journalist, the *Nippon* landed in Seattle on August 31. From here it went to Los Angeles, and then to New York, arriving there on September 9. The 34,000-mile flight ended October 20 when flight commander Sumitoshi Nakao set the *Nippon* down in Tokyo, completing what was said to be the most spectacular feat in Japanese aviation history.

During the year the Army Air Corps broke six international records. The first of the new records was set by a Boeing B-15 "Super Flying Fortress" when it averaged 166.32 m.p.h. while carrying 2000 kilograms (4409 lb.) payload for a distance of 3107 miles, or 5000 kilometers. No other plane in the world had formerly qualified in this category.

A high altitude record of 33,400 ft. with 5000 kilograms (11,023 lb.) payload was made in a Boeing YB-17A "Flying Fortress." The former record with similar load was held by Germany with a mark of 30,551 ft. in a Junkers JU-90. The same kind of ship was used to establish the speed record of 259.398 m.p.h., carrying a 5000 kilogram payload over a 1000 kilometer course.

The former record of 251.878 m.p.h. was held by Italy.

A fourth record set by the Army Air Corps was the high altitude record of 8200 ft. with greatest payload (31,205 lb.). This record was set in a Boeing B-15. The former mark was 6561 ft. with 28,660 lb. carried by a Russian *Maxim Gorky*.

The Los Angeles-New York course record of 9 hrs. 14 min. 30 sec. was set by the Army Air Corps with a Boeing B-17B. The former record (for planes carrying passengers or crew) was held by D. W. Tomlinson when he flew a Douglas DC-1 over the course in 11 hr. 5 min. 45 sec.

The last of the six new records set by the Army Air Corps was an amphibian speed record of 186.094 for a 1000 kilometer course, in a Wasp-powered Grumman OA-9. The former mark of 159.8 m.p.h. was held by Italy.

A speed record of great interest was set by Lieut. Tray Keith of Barksdale Field, Shreveport. On February 6 he dove from 28,000 ft. more than 3½ miles in a Curtis-Wright P-36A pursuit at an estimated speed of more than 11 miles a minute. Keith recovered at 9000 ft., landed with a buckled wing, and a speed indicator that had become stuck at 500 m.p.h. Army officers estimated the average speed at 670 m.p.h.

The 12th National Air Races held September 2-4 saw Frank Fuller fly his Seversky pursuit 2450 miles from Burbank to Bendix via Cleveland in an elapsed time of 8 hr. 58 min. 8.46 sec., an average speed of 273.14 m.p.h. This broke the record of 9 hr. 25 min. Fuller had set in 1937. Fuller is the only man who has won the Bendix Trophy twice. For a third time Roscoe Turner won the Thompson Race, but was unable to come up to his last year's, still standing, record of 283.419 m.p.h. Art Chester won the Greve race at an average speed of 263.39 m.p.h.

Miss Jacqueline Cochran kept the feminine half of aviation in the running by piloting her Beechcraft to 33,000 ft., breaking the women's altitude record for craft of 985 cu. in. displacement. The Women's National Aeronautic Association voted Miss Cochran the outstanding woman pilot of the year, for the second year in succession.

Abroad new records were claimed early in the year by Germany. On April 27 pilot Fritz Wendel flew a Mercedes Benz-powered *Messerschmidt* over 2 kilometers at an average speed of 55.11 km/hr. or 468.92 m.p.h. In a flight the record of which is much disputed by foreign aviation experts, Capt. Hans Dieterle claimed an average speed of 463.943 m.p.h. on a 3-kilometer regulation course. This record was made on March 30 at Oraienburg, near Berlin, in a Heinkel machine. The Heinkel's speed was 60 per cent of the speed of sound at sea level.

A new non-stop flight record between Paris and Algiers was set in May when a Lockheed 14 operated by Air Afrique and piloted by Lockheed's chief test pilot, Marshall Headle, flew the 908 mi. in 3 hr. 55 min.

Alex Henshaw knocked 31 hours off the mark for round trip flights between England and Cape Town, when he completed the trip in 4 days and 10 hr. 43 min. The old record set by A. E. Clouston and Mrs. Betty Kirby-Green was beaten by 1 day, 7 hr., 13 min.

Two records of very contemporary interest were set early in the year. Alexander Seversky set a record for the Copenhagen-London flight, a distance of 650 miles, when he flew the trip in 2

hr. 25 min. on April 9 in a convoy fighter of his own design. J. K. Quill flew his "Spitfire" low-wing monoplane powered with a Rolls Royce Merlin 990/1040 h.p. engine over the Paris-London course of 205 miles in 41 minutes, an average speed of 300 m.p.h.

At home several new records for small aircraft were set during the year. On April 22, Dewey Eldred flew a Taylorcraft monoplane 1242 miles from Willoughby, Ohio, to Fire Island in 16 hr. and 58 min., an average speed of 73 m.p.h. This record for light seaplanes was broken on October 12 when Henry Chapman flew non-stop and non-refuelling from New York to New Orleans in an Aeronca powered with a 65 h.p. Continental engine and equipped with floats. Chapman covered the 1186 miles in 13 hr., 35 min., setting the latest record average speed for light seaplanes at 88 m.p.h.

On October 23 Kelvin Baxter and Robert McDaniels landed at Muncie, Ind., in a Piper Cub, powered by a 55-h.p. Franklin engine, after establishing a new world light landplane endurance record of 535 hr., 45 min.

An all-class endurance record was set on October 29 when Wes Carroll and Clyde Schlieper landed their Piper Cub seaplane powered by a 50 h.p. Continental engine, after remaining aloft over Rosamond Dry Lake, Calif., for 726 hr.

Private-Owner Aviation. While war, or the threat thereof, almost eliminated the individual non-military aviator from the skies of Europe, participation in aviation by individual Americans broke all previous records. At the beginning of 1939 there were in the United States a total of 22,983. On Jan. 1, 1940, there were 31,264. At the beginning of the year, the number of planes certificated for civilian use was exactly 10,000. At the end of the year there were 12,829. During the first nine months of 1939, 2698 planes were turned out of American factories for domestic civil use, compared with only 1313 produced during the corresponding period of 1938. The total production of such planes for 1939 was estimated at the year's end at approximately 4000, compared with only 1823 in the previous year.

As in domestic transport a part of this progress can be attributed to an improvement in general business conditions. Most of it, however, is attributable to the rapidly increasing vogue of small two-seated monoplanes of the so-called "flivver" plane class which are available at prices as low as \$1095 and which in typical American fashion can be purchased for a down payment of approximately a third of that sum. The wide-spread adoption of this type of plane in commercial flying schools has been steadily decreasing the cost of flight instruction. Its low costs of operation and maintenance have made it a practical possession for large numbers of people heretofore unable to afford aircraft ownership and its generally satisfactory flying characteristics recommend it to the private pilot who wishes to participate in flying activity without undue hazard. Almost the entire gain in civilian aircraft production registered in 1939 over the production of 1938 was accounted for by the increased production of this type of plane.

It is important to realize that almost all of the above figures represent a naturally increased acceptance of private flying by the American public. To this rate of growth was added during 1939 a remarkable stimulus in the shape of a plan to extend Government assistance into the field of

civilian flight training. Known as the Civilian Pilot Training Program, the plan provides for the training of 10,000 young Americans almost entirely at Government expense by the summer of 1940. Administered by the Civil Aeronautics Authority the plan was installed on an experimental basis at 13 American universities during the spring of 1939. Of 330 students accepted for training some 317 were put through a carefully worked out course of ground and flying instruction and qualified for private pilot certificates. Following the success of this experimental phase, Congress passed a Civilian Pilot Training Act authorizing the operation of such a program on a nation-wide scale for five years, and appropriated \$4,000,000 for an initial full-scale year. By the end of 1939, 9310 college students in 437 colleges and universities had been enrolled and had begun ground and flight training. To be accepted for the instructions applicants had to be between 18 and 25 years of age, pass a rigid physical examination and possess American citizenship. Instruction given them consisted of a ground course of 72 hours of lectures, generally at the participating university, and of from 35 to 50 hours of actual flying given at some nearby commercial flying school. Four of the colleges were exclusively for women, and authorities of co-educational schools participating in the program were permitted to admit girls to fill up to 10 per cent of their quotas. Five colleges in this program were devoted exclusively to the education of members of the colored race. Outside the limits of the college training some 700 scholarships were being offered to the best graduates of ground schools organized in 70 communities throughout the nation.

Organizers of the program had every reason to expect that such an annual addition of at least 10,000 new pilots to the country's airmen over and above the natural rate of pilot increase would have tremendous results in bringing about the beginning of a really widespread use of aircraft by the individual.

Airports. With the rapid increases registered in all types of flying through the year, questions of airport size, maintenance, operation, and finance became even more important than in former years. The Civil Aeronautics Act of 1938 had specifically requested the Civil Aeronautics Authority to make a survey of the airport situation throughout the United States and to submit its findings and recommendations to Congress. On Mar. 23, 1939, the Authority therefore submitted an extensive report. Recognizing that the "development and maintenance of an adequate system of airports and seaplane bases should be recognized in principle as a matter of national concern," the Authority found that such a system should be regarded, under certain conditions, as a proper object of Federal expenditure. Specifically, it found that during periods when the Federal government was expending large sums on work relief projects the highest preference might well be accorded to those related to the construction or improvement of airports. When such relief funds should be seriously curtailed, the report advised that the Federal government should make specific appropriations for airport projects, giving preference in its allocation of such funds to states which had developed well organized airport development plans of their own and which had taken legislative steps to protect its airports with proper zoning statutes. The authors of the report developed three possible scales of expenditure for the consideration of

Congress. The first involved the expenditure of \$128,000,000 to bring to a "properly high standard of quality" the airports already designated as airmail stops. The report pointed out that although 236 cities had been designated as airmail stops, only 179 were actually receiving service, since many of them were unsafe for use by modern air transport planes. To extend adequate airport development to a total of some 860 airports, which the report found would provide for a considerable expansion of the air transport system and for many of the needs of private flying and pilot training, the report offered a program costing about \$230,000,000. A third choice for Congressional consideration offered a completely adequate airport development program for about 3500 airports, as compared to 2174 existing airports and intermediate fields, at an estimated cost of \$435,000,000.

Identical bills were introduced in the two houses of Congress to make appropriations for the smallest program of the three, but did not reach even Committee hearings during the year. Meanwhile, with some action possible during 1940 in view of the War Department's interest in the program, numerous municipal officials throughout the country took the stand that the Federal government should provide not only for the construction and improvement of American airports but should also bear a heavy share of airport maintenance and operating cost, items which the Authority's report had specifically exempted as proper objects for Federal expenditure.

As in preceding years the WPA expended large sums on airport projects, approximately \$40,000,000 of Federal relief funds being devoted to the enlargement and improvement of some 307 airports throughout the year. Local sponsorship and participation increased total expenditures on these projects to approximately \$62,000,000.

The nation's principal air traffic centers continued progress in size, hangar facilities, and the provision of adequate buildings for the use of the traveling public and airline employees. Most outstanding airport dedication during the year was that of La Guardia Field at North Beach in the Borough of Queens, New York City. Involving the movement of a prodigious amount of filling material and the construction of seven huge hangars and two elaborate passenger terminals, the field as dedicated on October 15 represented the investment of some \$40,000,000 of Federal relief and city funds. On November 7 the field, which offers one runway 6000 feet in length and three others longer than 3500 feet each, as well as facilities for trans-oceanic flying boats, was designated by the Civil Aeronautics Authority as a co-terminal with Newark Airport for the New York Metropolitan district. Within a few weeks of the opening of operations upon it by United Air Lines, American Airlines, and TWA, all of whom had contracted for hangar space, the transport experts were already seeing a date in the not too distant future when the field would no longer be completely adequate to handle all its traffic.

Progress on the national airport at Washington inaugurated in the fall of 1938 continued at high speed, and by the year's end U.S. Army engineers co-operating with WPA and Civil Aeronautics Authority personnel on the project were able to announce that construction work was two and a half months ahead of schedule and that the field seemed almost certain to be ready for use in July, 1940.

In Chicago completion of an extensive WPA project almost doubled the landing area of that important and extremely busy air terminal but up to the end of the year the new runways were still unused, due to the fact that a railroad still bisected the new and old portions of the field. Elimination of that obstacle was expected during 1940 through condemnation proceedings. In Los Angeles a successful drive for a municipal bond issue insured progress in the near future toward a unified air terminal at the municipal field.

Airplane Design. Throughout all the world aeronautical research laboratories and airplane design offices laid unprecedented emphasis upon the solution of problems connected with military aircraft. Top speeds of military fighters, which had reached perhaps 320 miles an hour in crack pursuit squadrons, were no longer considered satisfactory. Instead prototypes whose speeds approximated 400 m.p.h. were tested in several countries. In this country the Lockheed Aircraft Co. produces such a plane in the shape of a twin-engined single seater equipped with a three-wheel landing-gear. The Bell Aircraft Co. turned out another three-wheeled single seater whose single engine was mounted behind the pilot and drove the propeller to a long transmission shaft. In the field of bigger planes stress was laid upon the medium range, high speed, heavily armed bomber, of which each nation turned out several types. Best performances in this class probably matched the 320 miles an hour common to single seater types of 1938 manufacturers. Much of the increase in speed was made possible through the availability of new engines of unprecedented horse power. At the year's end the United States alone was turning out one engine type of approximately 2200 h.p. output. Another rated at 2000 h.p., and a third specially designed for work at high altitudes of some 1800 h.p. A year previously the largest available engines were in the neighborhood of 1500 h.p. and there were comparatively few of these yet in service. Other factors contributing to increased performance were the almost universal elimination of exposed rivet heads by the use of flush riveting, and the refinement of aerodynamic shapes along lines indicated by the research in new extra high speed wind tunnels. At the year's end aerodynamic experts in touch with these wind tunnels were talking confidently of airplanes capable of 500 miles an hour speeds.

Domestic Transport. Within the United States the Nation's 17 scheduled airline operators enjoyed what was by far the best year in their history. During the 12 months of 1939 these carriers flew 81,700,000 miles, an increase over 1938 of 17 per cent. They carried approximately 1,900,000 passengers, an increase of 43 per cent for the year. These passengers flew altogether 738,000,000 passenger miles, an increase of 39.5 per cent over domestic air travel in 1938. Air express traffic and airmail cargoes continued their steady increase during the year to new record figures, express increasing by 28 per cent over 1938, air mail by 15 per cent. These accomplishments, coupled with readjustments of the airmail rates for some of the lines, enabled the industry as a whole to make a net profit for the year, the first time such a thing had been accomplished in its history.

Many things contributed to this prosperity. Business conditions generally were better throughout the country than they were in 1938. Practically without exception the traffic departments of

the individual airlines reached new levels of effectiveness. Toward the end of the year the industry as a whole launched its first unified advertising campaign along lines pioneered by the railroad industry. But undoubtedly the largest single factor in bringing about this new acceptance of air transportation by the American public was the new level of safety which these carriers achieved in their operations. During the entire 12 months there occurred only two fatal accidents. In the two together only nine passengers were killed. This established for the year a safety index of 82,000,000 million passenger miles per passenger fatality. The best previous record in airline history had been set in 1938 when the index stood at 22,000,000 passenger miles per passenger fatality. Making the record even more dramatic, the second of the two accidents occurred on March 26, leaving the final nine months and five days of the year completely free of trouble.

The factors which contributed in turn to this safety record were also numerous. Practically all the airlines involved were flying equipment to which their pilots had had several years to become accustomed. The Federal airway system of radio and other aids to air navigation was brought to a new level of effectiveness and was considerably extended along air routes which previously had had but few ground facilities. The airlines themselves had voluntarily agreed in the fall of 1938 to refrain from competitive practices which sometimes led to the dispatching of planes in unfavorable weather to gain an advantage over some rival on the same or along a parallel route. But undoubtedly a large share must be given to the passage during the summer of 1938 of the Civil Aeronautics Act. Guaranteed for the first time through the provisions of this Act of a stable future, a freedom from unrestricted competition and an ample income for financial stability, the air carriers were able to make long range plans and formulate conservative operation policies which included the purchase of much new equipment, new expenditures for maintenance, and the promotion of a high morale throughout their personnel.

Outside the field of operations in traffic, the domestic air transport year was likewise featured by the establishment of working relations with the new Civil Aeronautics Authority. By the fall of 1939 that Authority had issued certificates of public convenience and necessity to all 17 of the established domestic operators and had readjusted airmail rates for some eight of them. Since the airlines which first filed petitions for hearings on airmail rates were naturally those most in need of financial assistance, the new rates fixed in these cases were almost universally favorable to the petitioning airline, although the Authority served notice toward the end of the year that it considered its duty to include the study of airmail rates with a view toward the decrease of Federal payments for such service should the growth of non-mail revenue reach a point which seemed to warrant reductions. To this end it instigated upon its own initiative hearings into the airmail rates paid to all carriers which had not up to that time themselves asked for hearings.

A number of new companies seeking certificates to open new routes were organized during the year and a number of established carriers likewise requested permission to extend their operations. By the end of the year there were no less than 67 such petitions before the Authority. Although

hearings had been held on a number of these applications none had been decided as of December 31.

The requirements of rapidly increasing traffic resulted during the second half of the year in a flood of orders for new aircraft. In November the Air Transport Association announced that \$25,000,000 worth of equipment had been ordered by its members from American manufacturers for early delivery. The great majority of these orders called for 21-passenger all-metal monoplanes of the Douglas DC-3 type which had been in service on most of the important trunk routes of the country for the past two seasons. Many of the new planes were destined for the establishment of new schedules on those routes. Many also were called for by airlines operating routes of secondary importance whose traffic had formerly justified only smaller aircraft. During the year the big four-engined land plane, which had been developed for United Air Lines and four other companies associated in a development contract with the Douglas company, was given an extensive service testing on United's routes in the course of which it was demonstrated at many large American cities. The original model was later sold to Japan, but at the year's end both United Airlines and American Airlines had placed orders for fleets of ten of these four-engined planes. While the ships actually ordered were to be somewhat smaller than the original development model, they insured that these two airlines would definitely undertake four-engine high-level operations on their transcontinental services by 1941. Meanwhile Trans-Continental and Western Air, the third big operator between the East and West, had apparently stolen a march on its competitors by ordering four four-engined land planes of the "Stratoliner" type from the Boeing Co. of Seattle for delivery during the spring and summer of 1940. Undoubtedly, planes of this type would have been in service even earlier save that the first of them to be tested crashed during tests in March. Thereafter tests were renewed on an extraordinarily thorough basis and the ship subjected to a number of modifications to eliminate any possibility of the recurrence of such an accident.

The domestic airline industry at the end of 1939 employed 9445 people, and had in service some 254 transport airplanes.

World Air Transport. In a year in which military aviation loomed so large in world affairs, it was easy to gather the impression that the great stimulation which occurred during 1939 in the progress of aviation was entirely attributable to military developments. Such, especially in the United States, was far from being the case. In fact, to the expert, the limited activity of military aircraft in European warfare up to Jan. 1, 1940, seemed far less important as events in aviation history than the spectacular gains registered during 1939 in the fields of air transportation and private-owner flying.

Viewed from a world perspective, the outstanding achievement in air transportation during the year was the final consummation of plans formed during the preceding decade for the establishment of scheduled airplane service across the North Atlantic. The year opened with the situation regarding the granting of reciprocal operating privileges by the United States and Great Britain to each other's airlines still in a deadlock.

BRIDGES

Airways of Great Britain had agreed that neither would start operations between the United States and England until both were ready to do so. In the early weeks of 1939 Pan American received delivery of the first of its big 81,000 lb. Boeing-built Clippers and indicated that it was ready and willing to begin service. Imperial Airways, however, hampered for the past several years in securing new aircraft by the concentration of British aircraft factories on military orders, had no planes ready which were capable of carrying commercial loads on a trans-Atlantic assignment.

Then France, whose company Air-France Trans-Atlantique also wished a share of the trans-Atlantic service, came forward with an offer to let Pan American use a base at Marseilles. Since Pan American already held permission from Portugal for the use of the Azores, this made possible the establishment of an American air service without reference to the British authorities. In any case the announcement of arrangements with France was soon followed by word from England that Imperial Airways would have no objection to Pan American's establishment of service even on routes using British territory.

With landing rights thus assured, Pan American Airways pressed its application for a route certificate which was already before the Civil Aeronautics Authority for decision. On May 19 the certificate was granted and the next day (dramatically important as the 12th anniversary of Charles A. Lindbergh's flight to Paris) Pan American Airways dispatched the *Yankee Clipper* to Marseilles, via Horta and Lisbon, with the first cargo of mail ever carried across the Atlantic by scheduled airplane service. By the end of June inaugural flights with mail had been made over the Northern route via Botwood, Newfoundland, and Foynes, Ireland, to Southampton, England, and soon thereafter both services were opened to passenger traffic.

The opening of hostilities in Western Europe necessarily affected schedules, but the airline continued to operate its planes by concentrating all its operations on the so-called Southern route and terminating its flights at Lisbon, Portugal, thus avoiding actual entrance into the zone of hostilities. Late in December the service completed its hundredth crossing. On those crossings no less than 1786 passengers and some 81,015 lb. of mail had been carried.

Both France and England also opened mail service during the year across the North Atlantic. In May Air-France sent its big flying boat *Lieutenant de Vaisseau Paris*, which had been used in 1938 for survey flights, on a final experimental round-trip crossing. On July 15 it completed another passage, this time carrying a small amount of mail. The British in August began operation of an airmail service using short Empire boats which were to take off only partially loaded with fuel, then have their fueling completed from big land planes especially fitted with tanks and long fuel lines for the purpose. The first crossing, that by the flying boat *Caribou*, was a substantial success, but both British and French crossings were suspended just prior to the outbreak of the war and had not been resumed at the end of the year.

The year's trans-Atlantic developments also included a strong bid by a second American firm, American Export Airlines, for a share in the operations. During the summer it carried out several round-trip survey flights in a twin-engined Consolidated flying-boat similar to those used by

the U.S. Navy as scout bombers. At the year's end that airline was busy submitting evidence to the Civil Aeronautics Authority to prove that it should be permitted to establish a service via Spain to Rome for the duration of the war and thereafter be permitted to share Pan American's routes to England and France. No decision was expected, however, until some time in the early spring of 1940, and even if its petition is allowed it seemed unlikely that American Export could have adequate equipment ready for mail and passenger service before 1941.

Elsewhere throughout the world international air transport was more affected by the outbreak of hostilities than by any other factor. Imperial Airways, badly in need of equipment due to the press of military orders in the British factories, had in fact shown signs that it could not maintain its full services to Africa, Asia, and Australia even before September.

Services throughout Europe were badly disarranged, but by the year's end showed an astonishing number of lines restored to operation. The German Lufthansa continued operations between Berlin and Bucharest by way of Vienna and Budapest and to Rome by way of Venice. It likewise was operating some of its purely internal lines and was maintaining connections with Denmark, Norway, and Sweden. The Dutch airline K.L.M. maintained connections with London and Scandinavia. British, French, and Dutch maintained services to Africa, India, Asia, and Australia, but terminated service in Europe at Rome rather than in the capitals of other countries. Throughout the Mediterranean and Balkan area services by Spanish, French, Italian, and other airlines was practically on a normal peacetime basis.

Across the South Atlantic both French and German lines suspended, but the French soon resumed on a regular weekly schedule. At the year's end it was in fact joined by a new Italian service attempting to establish itself along the southeast coast of South America, and K.L.M. announced that it would open a service to Dutch Guiana across the South Atlantic some time early in 1940.

Pan American Airways greatly improved its service across the Pacific by reinforcing its Martin-built *Clippers* with two of the Boeing-built type and surveyed the route between California and New Zealand in one of the latter ships as a move toward securing a route certificate from the Civil Aeronautics Authority. Both in the Pacific and on its extensive routes in Latin America Pan American Airways registered traffic gains of almost 100 per cent over 1938, large gains being recorded after hostilities broke out in Europe and shipping activities decreased throughout the world.

Military Aviation. The year 1939 in military aviation was featured less by what was proven than by the number of unanswered questions which at the year's end still surrounded the potentialities of the modern airplane in warfare.

In the theaters of active warfare in China, Poland, and Finland the airplane did play an active and important part in developments. In the Far East Japan continued to demonstrate that airplane squadrons operating with little effective opposition are of great value in harassing railroads and other lines of communication, and in bringing warfare and destruction to enemy headquarters no matter how far into the interior they may be withdrawn. In Poland, German airmen, conducting continuous and devastating raids against almost every important town and com-

munication line, contributed tremendously to the success of Hitler's *blitzkrieg* campaign but here, too, aerial opposition was almost non-existent. In Finland, although Russian bombing squadrons wreaked heavy damage on Helsinki and other Finnish towns, the opposition of a small but effective air service and apparently efficient anti-aircraft artillery kept the numerical strength of the Russian force from playing a controlling part in the contest.

Such general conclusions as can be drawn on these developments are, however, not particularly new. It has been fully demonstrated in the Spanish war, for example, that an air force possessing clear superiority in the air can be extremely effective—in fact almost decisive—when used in connection with ground troops operating in open warfare. From Spain, from previous campaigns in China, and in fact from considerable experience in the World War of 1914-18 the limited bombing of important enemy cities had been proven to be highly destructive of property but unsuccessful as a means of destroying enemy morale. In fact until civilian populations are already despairing the success of their cause it seemed evident that such bombings produced a clear-cut effect in the opposite direction, actually seeming to arouse a determination to win against a heartless enemy at any price.

Perhaps the realization of this factor had much to do with the noteworthy failure of both Germany and the Allied powers to bomb each other's cities during the first four months of the conflict in Western Europe. Perhaps each side realized it would face the most desperate sort of resistance from defending plane squadrons and anti-aircraft batteries if it undertook massed bombing raids. Whatever the reasoning, it was true that the raids carried out by German airmen over Great Britain and France and by the Allies over Germany during the first four months of the war were entirely of the reconnaissance type or were actually directed against purely military targets. Chief among these last were raids against British and German naval bases. But even here few clear-cut answers were forthcoming to questions which had caused pre-war debating. Beyond doubt squadrons on both sides inflicted serious damage on enemy warships, but no absolutely reliable reports were on hand at the year's end to indicate that the airplane had definitely proven its ability to sink a properly protected capital ship. The use of German planes against Allied ships of commerce in the North Sea on the other hand proved effective beyond question and seemed likely to replace in large degree German use of the submarine for that purpose.

By the end of the year both sides in the conflict were locked in a struggle to build up their fleets of fighting planes against the day when really large scale aerial warfare might get under way.

Figures on production and on airplanes in hand were naturally extremely hard to obtain, but consensus among American experts gave Great Britain credit for approximately 6000 first-line combat planes; France approximately 3000; Germany between 9000 and 10,000. In the field of reserve planes Germany was thought to possess about 7000 against 4000 for Great Britain and 1000 for France. At the year's end Great Britain was probably producing 1000 planes a month; France 400; Germany about 1200. With such a close numerical balance the deciding factor at the end of 1939 seemed likely to be the speed with which

the Allied nations could secure airplane deliveries from the United States. As of December 31 the Allies had placed orders for approximately 2000 combat planes and 1000 trainers with American factories and it seemed possible that all these ships plus another 1000 combat planes would be delivered by the end of 1940.

DANIEL SAYRE.

AFGHANISTAN, āf-gān'ī-stān; -stān'. A monarchy in central Asia, bounded by India, Iran, and the U.S.S.R. Area, 250,965 square miles; population, variously estimated at from 7 to 10 millions. Chief towns: Kabul (capital), 80,000 inhabitants; Kandahar, 60,000; Herat, 30,000; Mazar-i-Sharif, 20,000. Persian, Pashto, and Turki are the languages spoken. Islam is the principal religion. Elementary and secondary schools are free; for higher education there are technical, art, commercial, and medical schools.

Production and Trade. Though a great part of the country is of a mountainous nature and much of the land is dry and rocky, there are many productive valleys and plains which, with the aid of irrigation, yield good crops of cereals, fruits, and vegetables. Castor-oil, madder, and asafetida plants grow abundantly. Fruits, both fresh and preserved, are the staple food of a large section of the people throughout the year. The native fat-tailed sheep furnish the chief meat food, the grease from the tails being used as a substitute for butter, while the wool and skins are made into clothing. Lapis lazuli, copper, lead, iron, crude oil, and gold are the chief minerals. There are factories for the manufacture of matches, buttons, leather, wool, shoes, furniture, arms and ammunition, and clothing.

The principal imports are cotton goods, sugar, dyes, hardware, leather, and silver treasure; exports consist of lambskins, fruits, timber, carpets, and raw wool. Most of the trade is with India, the U.S.S.R., and Iran (Persia). The main routes to India are from Kabul through the Khyber Pass to Peshawar and from Kandahar to the railway terminal at Chaman in Baluchistan. Merchandise is transported to a large extent by camels and pack-ponies, but certain roads are used by motor vehicles during dry weather. There are telephone systems in the large towns, telegraphic communications linking Kabul and Kandahar with Peshawar and Chaman, and five wireless stations. In 1938 there were 4000 miles of highways.

Government. Revenue is estimated at 150,000,000 Afghani rupees (Afghani rupee is valued at about \$0.09). Afghanistan is a constitutional monarchy, with legislative power vested in a parliament consisting of the King, a senate of 45 members appointed by the King for life, and a national assembly of 109 elected members. King, Mohammed Zahir Shah (succeeded Nov. 8, 1933).

History. The outbreak of the European war in September, 1939, had almost immediate repercussions in Afghanistan which indicated that the isolated kingdom might soon be drawn into the conflagration. A rising against King Zahir Shah was started on the Indian frontier near the Khyber Pass on September 7 by Afghan supporters of former King Amanullah, who was forced to flee the country in 1929. The rebel army of some 3000 tribesmen failed to win the expected support from other Afghan tribes and was dispersed by Afghan troops with the co-operation of British-Indian political and military authorities.

Foreign agents, known to be active in Afghan-

istan, were believed to have inspired the rising. The *London Times Weekly* of June 21, 1939, reported that Afghanistan was "becoming more popular with Germans, Italians and Japanese than is justified by the economic opportunities offered in that country." The implication was that they were using the country as an espionage and propaganda base against both the Soviet Union and British India. German influence was said to be spurring Indian malcontents to stir up the frontier tribes against the British, as was done during the World War.

Russia became the principal threat to Afghanistan after the Soviet-Nazi rapprochement and the Soviet-Japanese armistice gave Moscow an opportunity to expand Soviet territories and influence. It was reported from Shanghai on October 2 that Afghanistan was mobilizing to repel border incursions by Russian troops. The Soviet pressure on Iran (q.v.) was likewise an indirect threat to Afghanistan. Istanbul reports late in October were that representatives of Afghanistan, Iran, Iraq, and Turkey were conferring there on joint action to resist a possible Soviet attack.

AFRICA. A continent with an area of about 11,696,000 square miles and a population estimated at 155,300,000 on Dec. 31, 1938. See the separate articles on its countries and territories, such as ALGERIA, EGYPT, ITALIAN EAST AFRICA, KENYA, MOROCCO, SOUTH AFRICA, UNION OF; TUNISIA.

AFRICAN METHODIST EPISCOPAL CHURCH. See RELIGIOUS ORGANIZATIONS.

AGNES SCOTT COLLEGE. An institution for the higher education of women in Decatur (Atlanta), Georgia. Founded in 1889. The enrollment for 1939-40 was 490. The faculty number 52 and the administrative staff 16 members. The endowment is \$1,637,000, and the gross income for the session 1938-39 was \$361,500. There are 34,250 volumes in the library. A new Music Building and Auditorium, costing \$260,000, was under construction. President, James R. McCain.

AGRICULTURAL ADJUSTMENT ADMINISTRATION (AAA). The Agricultural Adjustment Administration is an agency in the U.S. Department of Agriculture which operates programs that carry out the purposes of the Soil Conservation and Domestic Allotment Act, the Agricultural Adjustment Act of 1938, and related legislation. The purpose of this legislation is to conserve soil, improve farm income, and stabilize the supplies of farm products available for market at levels adequate to meet domestic, export, and reserve requirements.

The 1939 program aimed to keep the acreage of soil-depleting crops within the program goal of 270 million to 285 million acres, as compared with an average of 308 million acres for the five years, 1928 through 1932. Total acreage of soil-depleting crops under the 1939 program was 282 million acres. At the same time, the program sought to give greater importance to the role that such soil-conserving crops as legumes and grasses play in the Nation's cropping system. The goal was established in view of the current domestic and foreign supply-and-demand situation for each crop, the acreage required to assure supplies adequate to meet normal domestic consumption, and the acreage of soil-depleting crops which can be

grown safely from the standpoint of soil conservation.

Participation in the program is voluntary. Farmers receive agricultural conservation payments for keeping within individual acreage allotments of soil-depleting crops and for carrying out specific soil-improving practices. A total of \$499,560,000 was appropriated by Congress for the 1939 program. To bring returns nearer to parity levels as authorized by the Agricultural Adjustment Act, price-adjustment payments totalling 212 million dollars were also made available to producers of cotton, corn in the commercial corn area, wheat, and rice, who remained within their acreage allotments.

The Agricultural Adjustment Act of 1938 authorizes loans on any agricultural commodity, and makes mandatory crop loans on surplus cotton, corn, wheat, and rice under specified conditions of supply or price. The stored commodities serve as collateral for the loans which are extended through the Commodity Credit Corporation. Under the 1939 program, such mandatory loans were in effect for corn at an average rate of 57 cents per bushel, and wheat at an average rate of about 64 cents per bushel. Although not mandatory, loans also were available to producers of cotton, several types of tobacco, and various other commodities.

Marketing quotas were proclaimed for cotton, rice, and for Burley, flue-cured and dark tobaccos under the 1939 program, in accordance with legislative provisions which require proclamation under certain conditions of supply or price. However, these quotas are not effective unless they have the approval of at least two-thirds of the producers affected who vote in a referendum. While a referendum was held for each of the commodities, approval was given only in the case of cotton, in which producers voted 84 per cent in favor of the quotas. The quotas provide for a penalty on cotton marketed in excess of the quota. Late in 1939 referenda were held on marketing quotas for cotton and flue-cured and Burley tobacco, and quotas were approved in each instance, by the following percentages of votes: Cotton, 91.2 per cent; flue-cured tobacco, 90 per cent; and Burley tobacco, 83.3 per cent.

Preliminary estimates indicate that the 1939 program includes about 82 per cent of the Nation's cropland. Nearly six million farmers, working through more than 3000 county committees and 23,000 community committees, participated. These committees handle local administration of the AAA and Federal Crop Insurance programs, and assist in administering related programs of other agencies in the Department of Agriculture. See SUPREME COURT.

R. M. EVANS.

AGRICULTURAL CREDIT. See AGRICULTURE.

AGRICULTURAL MARKETING ACT. See DAIRYING.

AGRICULTURE. The American farming industry in 1939 in many ways showed definite advances over the preceding years. Cash farm income, including Government payments, was from 200 to 300 million dollars larger than in 1938. Slightly smaller production of crops on fewer acres with high average yields was offset by increased production of livestock products and large carry-overs of wheat, cotton, and feed grains. Although spring and fall droughts were

serious in the Great Plains and much of the interior and there was a severe summer drought in the Northeastern States and the Winter Wheat Belt, conditions in general elsewhere resulted in a record tobacco crop, an excellent corn crop, and a plentiful feed supply. Agriculture in 1939 was featured by a slight decline in values of farm real estate; slight change in the volume of farm mortgage debt, except for more new mortgage financing; ample mortgage credit on favorable terms; a greater volume of outstanding short-term loans; a slightly larger farm population; slightly lower farm wage rates; higher costs for farm machinery; and little change in average costs of building materials and fertilizers. Exports of farm products were reduced early in the year by several causes, although outward movement of certain commodities rose later in response to European war demands. Imports of competing products were much lower because of smaller consumer demand and abundant farm production. Farmers were aided in many ways by Governmental activities, including the soil conservation and crop adjustment programs; marketing agreements and surplus disposal, including the stamp plan; local, State, and Federal planning programs, especially for land use; crop insurance; sugar program; cotton adjustment and export program; and the Federal farm-credit institutions. The rural underprivileged were helped by rehabilitation; planning and guidance in farm and home management; co-operative medical care; adjustment of farm indebtedness; provisions for secure tenure; homestead projects; and the tenant farm-purchase program. The outlook for 1940, as seen near the end of 1939, was for a stronger demand for farm products, larger volume of marketing, slightly larger production for marketing, higher average prices and increased farm cash income. The several factors and trends active in the agricultural industry are treated in detail in the following pages. (See also sections on *Agriculture under the States*; sections on *Production under foreign countries*; separate articles on leading crops as CORN, COTTON, TOBACCO, WHEAT; METEOROLOGY; and articles on the following government topics: AGRICULTURE, DEPARTMENT OF; A.A.A.; COMMODITY CREDIT CORPORATION; F.S.C.C.; F.C.I.C.; F.S.A.; F.C.A.; FOOD AND DRUG ADMINISTRATION; *Farm Co-operatives* (under CO-OPERATIVES). See also DAIRYING, ENTOMOLOGY, ECONOMIC; FERTILIZERS; FORESTRY; HORTICULTURE; LIVESTOCK; POULTRY; SOILS; UNITED STATES under *Departments and Agencies* and LEGISLATION.

Agricultural Situation. Farm Income. Cash income from farm marketings in 1939 was estimated by the U.S. Department of Agriculture at \$7,711,000,000 and from government payments, \$807,000,000, a total of \$8,518,000,000; while for 1938, marketing income was \$7,599,000,000, government payments, \$482,000,000, and the total \$8,081,000,000. Cash income per farm was estimated at \$1199 and per capita \$259, against \$1184 and \$255 in 1938. The farm value of products retained for home consumption and the residential value of farm homes occupied were estimated at about \$2,000,000,000 in 1939 and, in addition, farmers received about \$2,000,000,000 from non-farm sources. Against this income, annual expenditures for commodities and services used currently in production during recent years have averaged a little more than \$2,000,000,000. Approximately \$2,000,000,000 was paid out on ac-

count of rent, taxes, interest, and hired labor, and about \$1,000,000,000 was needed to maintain farm plant and equipment.

Farm Real Estate. The slight decline in values of farm real estate during the year ended Mar. 1, 1939, only one point in the national index, was the first in six years. The index of average values per acre was 84 per cent of the 1912-14 level, versus 85 in 1937 and 1938 and still about 15 per cent above the 1933 low of 73. The decline during the year was attributed mainly to lower price levels for farm products and reduced farm income, and values were also affected adversely by the upward trend in farm taxes, and the extensive farm real estate holdings of creditor agencies. Average per-acre values continued upward in the East South Central group of States, marking the sixth consecutive year of increase, were unchanged in the South Atlantic and Mountain States, and declined slightly in each of the other major regions. The total holdings of farm real estate by leading groups of lending agencies were reported at \$1,019,000,000 as of Jan. 1, 1939, slightly below holdings on Jan. 1, 1938; and largest holdings were by life insurance companies, amounting to \$702,861,000. The changes in ownership per 1000 farms due to voluntary sales or trades fell from an average of 29.9 in the year ended Mar. 1, 1938, to 28.2 in 1939; forced sales due to foreclosures, etc., declined from 14.3 to 13.4 per 1000 farms; and due to delinquent taxes rose from 3.1 to 3.4 per 1000. Bankruptcies among farmers were reported in 1939 to have totaled 1799 during the year ended June 30, 1938, 3.6 per cent of all bankruptcies, as compared with 2479 in 1937, and 5917 in 1933.

Taxes. Farm real estate taxes levied in 1938, according to the U.S. Department of Agriculture, showed slight change from 1937 either on a per-acre basis or in relation to value, and a preliminary survey indicated little likelihood of any significant change from 1938 to 1939. The index of taxes per acre for the United States on a 1909-13 base stood at 186 in 1938 and 187 in 1937, compared with a low of 178 in 1934 and a peak of 281 in 1929. Taxes per \$100 of farm real estate value averaged \$1.16 in 1938 and \$1.15 in 1937, compared with a low of \$1.13 in 1936 and a peak of \$1.50 in 1932. Changes in taxes per acre between 1937 and 1938 were very small in most States, increases in many States being offset in the national average by States showing decreases. The latter included several with large reductions due to important changes in their property-tax laws. Factors seeming responsible for increases shown in each of the four years in large proportions of the State series included, in many States, continued pressure for restoration of governmental services curtailed during the depression; in some cases, restoration of salaries or resumption of debt service; and financing of new services.

Prices. Prices received by farmers for all farm products averaged 92 per cent of the five-year prewar average during 1939 against 95 per cent in 1938. During the first eight months of 1939, prices were relatively stable at a level averaging about five points lower than in the same months of 1938. Prices of grains, dairy, and poultry products began 1939 substantially below the January, 1938, level, and like those for meat animals worked steadily lower until the low of the year—88—in mid-August. Farm product prices rose sharply in response to the outbreak of hostilities in Europe in early September and the rise

placed the index at 98, the high point for the year. This advance was led by grains and meat animals. Prices receded slightly during October but held steady in November. Another small decline occurred in December, but the general level of prices December 15 was 96, the same as a year earlier. Not all commodities shared this year-end strength, for meat animals showed a marked decline, only part of which was seasonal in nature.

Average prices received by producers Dec. 15, 1939, based on reports to the U.S. Department of Agriculture, with seasonal average prices for crops in parentheses, were estimated for wheat 82.4 cents (67.6) per bushel, corn 50.3 (55.9), oats 34.7 (29.5), barley 43.8 (40.4), rye 52.3 (40.8), flaxseed \$1.80 (\$1.552), soybeans 97 (77.2), rice (rough) 72.3 (77.3), potatoes 70.8 (68.8), and apples 68 (66.3) cents per bushel, tobacco 13.8 (19.7) and cotton 9.71 (8.90) cents per pound, and cottonseed \$24.75 (\$21.67) and hay \$7.71 per ton. Beef cattle sold for \$6.85 per 100 lb., hogs for \$5.03, veal calves \$8.41, lambs \$7.38, and sheep \$3.79. Eggs were 20.5 cents per doz., butter 27.3 cents per lb., and whole milk wholesaled at \$1.99 per 100 lb. Wool brought 27.5 cents per lb. and live chickens 11.7 cents. Milk cows sold for \$59.90 each, horses \$77.10, and mules \$97.20. The corn-hog ratio (number of bushels equal in value to 100 pounds of hogs) was 10 versus 16 in December, 1938, and 11.2 the 5-year prewar average. The ratio of prices received to prices paid by farmers dropped from 80 in December, 1938, to 79 in December, 1939.

Farm Labor and Production Expenses.

Wage rates paid to farm workers averaged 122 per cent of prewar (\$20.41 per month with board) compared with 124 in 1938; up to September, 1939, less cash farm income was available to pay wages. Rural living costs, as measured by prices paid for commodities used in living, were 119 per cent of prewar in 1939, dropping slightly from 122 in 1938. The supply of farm workers averaged lower in 1938 as substantial increase in industrial employment took place. Further decline in total farm employment was prospective, continuing the trend evident since 1929, but greater use of mechanized equipment would enable farmers to maintain production at current levels. Minor rises in prices of some kinds of building materials were offset by declines in others in 1939. Prices of farm machinery other than tractors averaged slightly lower than 154 per cent of 1910-14 compared with 158 in 1938. Changes in prices of automobiles and trucks were not large. Wholesale prices of mixed fertilizers averaged slightly less than in 1938.

Foreign Trade in Farm Products. Several factors combined to make United States foreign trade in farm products unusually low during the year ended June 30, 1939. Exports, 23 per cent below 1937-38 in value, were the lowest in four years, largely as a result of low foreign industrial activity and purchasing power during the first half of the year, increased foreign production of commodities competing with United States farm exports, and the high price at which United States cotton was offered in the world market. Imports supplementary to domestic farm supplies, decreasing 17 per cent, reached the lowest total value in five years under the influence of smaller consumer demand and abundant farm production. Incomplete recovery of United States supplies of animal products from accumulated effects of the 1934 and 1936 droughts also helped to make exports lower,

and imports slightly higher, than they would otherwise have been.

Exports of farm products from the United States, exclusive of forest products, fell in value to \$682,914,000 during 1938-39, as compared with \$890,771,000 during 1937-38. In spite of large domestic supplies during the 1937-38 and 1938-39 marketing seasons, exports of farm products during 1938-39 were even lower than in 1936-37, the year of shortest domestic supplies, and made up a lower proportion of total United States exports than ever before, 23.7 per cent against 26.5 in 1937-38. Indexes of quantity showed that all major groups of agricultural exports, except cotton and linters and grain and grain products, were higher for 1938-39 than for 1937-38. Exports of cotton were \$134,000,000 lower in value than in 1937-38 while exports of agricultural products other than cotton declined \$74,000,000. There was a decline of \$78,000,000 in grain and grain products, smaller declines in tobacco, feed, and fodder, and moderate gains in fruits and pork and lard exports. The volume index was 63 per cent of prewar compared with 79 in 1937-38; 56 in 1936-37; 83 per cent in 1933-34; and with 136 in 1926-27. Sensational increase in the exports of cotton during the latter months of calendar 1939 was attributed largely to the government's export program and low stocks of American cotton in Europe.

Imports of farm products into the United States during 1938-39 were valued at \$998,616,000, a decrease of 13.4 per cent from 1937-38, which totaled \$1,155,136,000, and compared with \$1,536,695,000 in 1935-36, and \$614,000,000 in 1932-33, the low point of the depression. Supplementary agricultural imports in 1938-39 were about \$381,000,000 less than in 1936-37, when effects of drought and domestic demands were at their peak, about one-third of the decline occurring in grains and feeds. Reduction took place in imports of dairy and egg products, sugar, dutiable wool, hides and skins, and vegetable oils and oilseeds. Substantial increases were recorded in the quantity of tobacco and cattle imported. Agricultural imports made up about 48 per cent of all imports, 48.6 per cent, about \$486,140,000 being supplementary (competitive) items, and \$512,476,000 non-competitive. See IMPORTS AND EXPORTS. Aspects of and factors involved in foreign trade in farm products were discussed in the *Report of the Secretary of Agriculture for 1939*, pp. 1-14, 91-100, and in *Foreign Crops and Markets 39 (1939)* pp. 282-306 (Aug. 12, 1939), pp. 478-510 (Nov. 17, 1939), all U.S. Department of Agriculture.

Population. Farm population in the United States was estimated from U.S. Department of Agriculture surveys to total 32,059,000 on Jan. 1, 1939, compared with 31,819,000 a year before, and the peak of 32,076,690 in 1910. The movement to farms totaled 823,000 and to the cities 1,025,000, but the net loss by migration 202,000 was more than offset by the surplus of births over deaths.

Outlook. The features of the agricultural situation in 1939 and indicated developments in agricultural production and marketing in 1940, concerning the demand for farm products, farm credit and labor, equipment and fertilizer, farm family living, and the status and future of field crops for cash and feed, fruits, truck crops, nuts, livestock, poultry and their products, prepared by the U.S. Department of Agriculture in co-operation with State agencies were published in *The Farm Outlook for 1940* (M.P. 379, 1939); and

The Agricultural Situation (1939), monthly, (all U.S. Department of Agriculture).

Agricultural Credit Conditions. Farmers were expected to use from 5 to 10 per cent more short-term credit during 1939-40 for production and living costs, for livestock and machinery, and for farm improvements than in 1938-39, exclusive of Commodity Credit Corporation loans. Ample short-term credit would be available to meet all anticipated demands for credit by farmers of good credit standing. The commercial banks, production credit associations, and other agencies could easily expand their loans. Funds available for rehabilitation and emergency loans were slightly smaller than in 1938-39 and applications for rural electrification loans were exceeding available funds, but credit for other co-operative purposes seemed to be ample. Many farmers participating in the AAA farm programs were able to use conservation and price adjustment payments instead of borrowing funds.

The outstanding personal and collateral loans to farmers by commercial banks and short-term loans by the Farm Credit Administration increased during the year ended June 30, 1939, from \$1,166,492,000 to \$1,430,440,000, or about 23 per cent, about the same as the year before. The increase largely was accounted for by a rise of \$267,761,000, or 29 per cent in loans by commercial banks, due mainly to increased holdings of loans on stored farm products guaranteed by the Commodity Credit Corporation. Outstanding loans of banks for co-operatives decreased during 1938-39 from \$81,200,000 to \$59,576,000, which comprised commodity loans \$10,239,000, operating-capital loans \$25,872,000, and facility loans \$23,465,000. Since its inception to Sept. 28, 1939, the Rural Electrification Administration had allotted \$253,909,000 for loans for construction of rural distribution lines and generating stations and to finance installations of wiring and plumbing. Outstanding community and co-operative enterprise loans made by the Farm Security Administration increased from \$4,283,000 on June 30, 1938, to \$10,729,000 a year later. Financing through all Farm Credit Administration institutions increased during the last half of 1939, although total credit extended during the year, approximating \$600,000,000 was slightly lower than in 1938.

New loans from special appropriations for rehabilitation and emergency relief increased during 1938-39. The emergency crop production and feed loans by the Farm Credit Administration amounted to \$15,100,000 in 1938-39 compared to \$21,600,000 in 1937-38. Rehabilitation and emergency loans by the Farm Security Administration totaled \$113,000,000 in 1938-39 compared to \$67,300,000 during both 1937-38 and 1936-37, and its additional emergency subsistence grants to distressed farm families amounted to \$21,500,000, about \$1,000,000 less than in 1937-38.

Some increase in the volume of new mortgage financing was prospective late in 1939, largely in connection with farm real estate activity, farm improvements, and purchases of equipment. Extensive refinancing of distress mortgages had subsided greatly, and mortgage activity represented a more normal demand for credit to refinance maturing mortgages and to finance real estate transfers and additions to farm plant. Additions to mortgage debt through new financing probably would be offset by principal repayments, foreclosures, and reductions resulting from debt adjustments. Ample mortgage credit would con-

tinue to be available on favorable terms, and funds available for such loans from both Federal and private agencies were abundant. Increased funds were to be available in 1939-40 for tenant-purchase loans in 1300 eligible counties by the Farm Security Administration under the Bankhead-Jones Farm Tenant Act, amounting to \$38,000,000 compared with \$23,750,000 for 1938-39 and \$9,200,000 in 1937-38.

The farm mortgage debt was reduced markedly during the current decade—from \$9,631,000,000 in 1930 to \$7,071,000,000 in 1939—but was still much higher than in the years just before the World War. The reduction during the early 1930's was largely the result of foreclosures and distress transfers, while in recent years principal repayments were of increasing importance. Farm mortgage debt during the last 30 years was at a peak in 1922-23, about 172 per cent above the 1910-14 level, but declined in each subsequent year except 1927. The total on Jan. 1, 1939, was 27.6 per cent below that for Jan. 1, 1929, and about 34 per cent below 1922-23. Outstanding farm mortgage loans held by Federal Land Banks and Land Bank Commissioner totaled \$2,658,208,000 on June 30, 1939; by life insurance companies (estimated) \$881,000,000; commercial banks \$530,628,000; and held by joint stock land banks \$78,511,000. See also FARM CREDIT ADMINISTRATION, FARM SECURITY ADMINISTRATION, AGRICULTURAL ADJUSTMENT ADMINISTRATION, COMMODITY CREDIT CORPORATION.

Crop Production in 1939. Farm production was larger in 1939 than in 1938, according to the U.S. Department of Agriculture. The slightly smaller total yield of crops was more than offset by increased production of hogs and livestock products. There also were large carry-overs of wheat, cotton, and feed grains from preceding years to provide against possible shortages due to drought and other hazards. Total crop production in 1939 was about 1 per cent lower than in 1938 and nearly 4 per cent above the 1923-32 or "pre-drought" period average. Major crops showing increases were corn, barley, flaxseed, soybeans, and tobacco, and those with decreases included wheat, oats, rye, and peanuts. Tobacco and soybeans both were bumper crops surpassing all previous records. The area of the principal (46) crops harvested, 325,449,000 acres, was unusually small—the lowest since the early years of the World War—and compared with 341,744,000 acres in 1938 and a 1923-32 average of 354,000,000 acres. The reduction in 1939 appeared due to the large carry-overs, to the relatively low prices of some crops at planting time and to more general compliance with the adjustment program than in previous years. Much of the reduction resulted from discouragement, reduced plantings, and further heavy losses of acreage in a half dozen States in the central Great Plains area where drought conditions continued into winter. Pastures and ranges also dried prematurely, further retarding recovery of the livestock industry in this area. Yields per acre, however, averaged higher than in any of the last 25 years except 1937, and offset much of the reduction in acreage. Crop yields per acre were unusually good in the central and eastern Corn Belt, but were seriously reduced in the Central Great Plains by drought and in an excessively wet area extending from the Gulf into Alabama and northeastern Mississippi. The acreage and production of farm crops in the United States, as estimated by the U.S. Department of Agriculture, and yields for cereals

in foreign countries, as reported to the International Institute of Agriculture, are shown in the crop production tables and in the articles on individual crops.

ACREAGE AND PRODUCTION OF FARM CROPS IN THE UNITED STATES, IN 1938 AND 1939.

Bushels except as otherwise indicated.

| Crop | Year | Acres harvested | Acre yield | Production |
|----------------------|------|-------------------------|--------------------|----------------------------|
| Corn | 1939 | 88,803,000 | 29.5 | 2,619,137,000 |
| | 1938 | 92,222,000 | 27.8 | 2,562,197,000 |
| Wheat | 1939 | 53,696,000 | 14.1 | 754,971,000 |
| | 1938 | 69,869,000 | 13.3 | 931,702,000 |
| Oats | 1939 | 33,070,000 | 28.3 | 937,215,000 |
| | 1938 | 35,661,000 | 30.0 | 1,068,431,000 |
| Barley | 1939 | 12,600,000 | 21.9 | 276,298,000 |

Experiment Stations and Extension. Problems of agriculture received serious consideration from research and extension services as well as from action agencies. Research in the agricultural experiment stations, located in each State and Territory, aimed more and more toward planning for permanence and economic stability and stressed less than in earlier years, the expansion of production to assure more adequate supplies of farm products for a growing population and to sell abroad. Research programs of the experiment stations embraced a total of about 8500 projects, financed from all sources. Covering a wide range

of agricultural and rural life problems, these projects dealt with agricultural planning and land use, conservation of soil and water, cultural practices and crop varieties for use in rehabilitation of drouth-stricken, eroded, and flooded lands, and for replacements in land use and crop-control programs; pasture research; production, distribution, marketing, and use of crop plant and animal products; and protection of crops and farm animals against diseases, insects and other pests. Special attention was paid to problems of tenancy, marginal lands, and low income groups; efficiency of farm business management; profit margin, market demands; consumer needs and preferences; human nutrition; and rural housing. Many of the enterprises were co-operative with other stations and with the Department of Agriculture. Features of contributions from current research were detailed in *Report on the Agricultural Experiment Stations, 1939* (U.S. Dept. Agri., Washington, D. C.). Financial support for the State stations derived from all sources included \$6,541,250 from Federal grants and \$14,081,509 from State and other supplementary sources, totaling \$20,622,659 for the year ended June 30, 1939.

Research of the stations and the Department (see AGRICULTURE, U.S. DEPARTMENT OF) was supplemented in nine co-operative regional research laboratories, each with a specific research problem of major importance in the region served respectively including improvement of vegetables, pastures, swine, sheep, and viability in poultry, industrial utilization of soybeans, animal diseases, irrigation water, and relation of soils to nutrition. Authorized for study of new and wider industrial outlets and markets for agricultural commodities, four other research laboratories were starting operations near New Orleans, Philadelphia, Peoria, and San Francisco. (See 1938 YEAR BOOK, p. 10.)

Extension services enabled farm people to make progress in sound land use planning, crop adjustment, soil conservation, and improved tenure by providing the latest scientific information about efficient production and marketing of crops and livestock, on social and economic trends, and about agencies to be utilized in carrying out their plans. During the year ended June 30, 1939, extension agents organized 1 million adult result demonstrations on farms and in farm homes, and 1¼ million group meetings, made 3 million visits to farm homes and received many office calls from farm people, and in other ways disseminated technical information and helped farmers to consider it in relation to other factors of rural living. Aided by 14,000 voluntary leaders, they gave assistance in marketing work in some 18,500 communities, helping nearly 1,200,000 farmers, either as individuals or as members of co-operative groups. The agents helped farm people to fight numerous crop and livestock pests; to overcome effects of floods, droughts, and hurricanes; to get better hogs and cows and poultry; to establish all-year gardens and well-filled pantries; to beautify their homes; and to develop rural recreation and other community facilities for better rural living. More than 1,250,000 boys and girls enrolled in 4-H club work in 1939 benefited from extension activities. Personally and through local leaders, farmer land-use planning committees, agricultural-conservation committeemen, and other agencies in educational work, extension agents helped millions of farm people toward more profitable farming and more satisfying life. The co-operative ex-

 * The production given for countries in the Southern Hemisphere is for the crop years 1938-39 and 1937-38.

tension organization of the U.S. Department of Agriculture, land grant colleges, and county governments comprised in addition to supervisory officials, agricultural agents in every county of agricultural importance, home demonstration agents in nearly two-thirds of the counties, 1169 assistant agents, about 1500 state extension specialists, and in 256 counties, special Negro agents. More than 500,000 voluntary local leaders, selected and trained by county agents, helped to extend improved farming and homekeeping practices and 4-H Club work to almost every community. Of the total of \$32,000,000 funds available in 1938-39 for all co-operative extension work, about \$18,000,000 came from Federal grants to the States, \$6,500,000 from State funds, \$6,500,000 from county appropriations, and about \$890,000 from farm organizations. (See 1938 YEAR BOOK, p. 12.)

World Conditions and Agriculture. Prominent among major world conditions affecting American agriculture and its products were the controls of agricultural trade and production in the present war in Europe. From the outset, the war had been characterized by strict government control of international trade and, to a lesser extent, of production, prices, and consumption. Indeed, according to a special analysis of the U.S. Department of Agriculture, the war had altered world trade currents in such manner as to make prospects for United States farm exports poorer than if peace had prevailed. Trade controls in the arsenal of economic weapons used by belligerents and the economic defenses erected by belligerents and neutrals included naval blockades which barred American farm products from German-controlled territory, requisition and control of shipping, allocation of foreign exchange, import and export licensing, requisitioning of stocks, and control of prices and distribution which were being applied in many ways that governed the flow of American farm products into the territory of Allied belligerents or of neutral countries in the war zones. The Allies pooled economic and financial resources and they made arrangements to centralize their purchases through Government commissions. Although this latter means of trade control had not yet been brought to bear directly on United States farm exports, it did have an indirect effect since the centralized purchasing commissions bought farm products heavily in British Dominions and other countries where they could deal directly with governments. Application of these several types of trade controls had already exerted or might exert more or less adverse effects on trade of the United States in the principal export farm products: Cotton, wheat, tobacco, pork products, and fruits.

Among the activities and movements in foreign countries either affecting or which might affect American agriculture in world trade relations in some way were European wheat requirements and policies; the German-Rumanian economic agreement, and the increasing domination of southeastern European trade by Germany; increasing aids to British agriculture; demands of the British textile industry for raw cotton; expansion of food production and farm price supporting measures in Ireland; regulation of farm product marketing in Ontario; the agricultural problems of India; price control in New Zealand, and the wheat industry assistance scheme in Australia; agriculture in the French balance of trade, and the hog industry in France and Sweden; American tobacco markets in the Netherlands and

Switzerland; agriculture in the Soviet Ukraine, and the effects of drought and the purge on Soviet Union agriculture; foreign trade monopoly in poultry and eggs by Italy; control of wool prices and sales in Spain, and Turkish tobacco legislation. Other trends and events in world agriculture, also discussed in detail in *Foreign Agriculture* (vol. 3, 1939) and *Foreign Crops and Markets* (vol. 38 and 39, 1939), included the status of cotton production in Latin America; the grain-elevator program, price-fixing, and the pear industry in Argentina, and the Argentina-Brazil trade agreement; encouragement to agriculture and livestock industry in Venezuela; land problems in Mexico; aid to cattle industry in Colombia; aid to cotton growers in Egypt; recent Japanese agricultural policies, and the 10-year plan for agriculture in Formosa (Taiwan), and the agricultural situation in China. (See the respective countries under *Production*.)

Bibliography. Books published in 1939, which dealt with problems of current importance in agriculture included: C. Abrams, *Revolution in Land* (New York, 1939); O. E. Baker, R. Borsodi, and M. L. Wilson, *Agriculture in Modern Life* (New York, 1939); C. Beals, *American Earth, the Biography of a Nation* (Philadelphia, 1939); A. Boss et al., *Agriculture, I* (St. Paul, Minn., 1939); G. E. Britnell, *The Wheat Economy* (Toronto, 1939); G. W. Forster et al., *Outlines of Agricultural Economics* (Ann Arbor, Mich., 1939); A. F. Gustafson et al., *Conservation in the United States* (Ithaca, N. Y., 1939); R. R. Hudelson, *Farm Management* (New York, 1939); D. R. Matlin, *Growing Plants Without Soil* (New York, 1939); A. J. Muench et al., *Manifesto on Rural Life* (Milwaukee, 1939); W. E. Petersen, *Dairy Science* (Philadelphia, 1939); H. A. Phillips et al., *Agriculture and Farm Life* (New York, 1939); E. D. Sanderson and R. A. Polson, *Rural Community Organization* (New York, 1939); D. Warriner, *Economics of Peasant Farming* (New York, 1939); T. J. Wooster and E. Winston, *Seven Lean Years* (Chapel Hill, N. C., 1939); *Agricultural Statistics, 1939* (Washington, D. C., 1939); *Food and Life: Yearbook of Agriculture, 1939* (Washington, D. C., 1939); H. A. Wallace, *Report of the Secretary of Agriculture, 1939* (Washington, D. C., 1939); A. Bell, *Men and the Fields* (New York, 1939); H. H. Bennett, *Soil Conservation* (New York, 1939); D. W. Malott and B. F. Martin, *The Agricultural Industries* (New York, 1939).

HENRY M. STEECE.

AGRICULTURE, U.S. DEPARTMENT OF. Henry Agard Wallace of Iowa was Secretary of Agriculture during 1939 and Milburn L. Wilson was Under Secretary. By the government administrative reorganization effective on July 1 (see under UNITED STATES), the Department took over the previously independent agencies which had to do with agriculture, namely, the Farm Credit Administration, the Commodity Credit Corporation, and the Rural Electrification Administration. At the same time, the Bureau of Biological Survey was transferred to the Department of the Interior and the Bureau of Public Roads became a part of the new Federal Works Agency as the Public Roads Administration (see ROADS AND STREETS); the Foreign Agricultural Service was put under the jurisdiction of the Department of State.

Because of the opposition of farm groups to

the absorption of the Farm Credit Administration by the Department of Agriculture, the FCA maintained a quasi-independent status within the Department for some months. In December Secretary Wallace maintained that, if he were to be held responsible for the FCA, he should have jurisdiction over it. The concurrence of the President in this opinion resulted in the resignation of the Administrator, F. F. Hill, who was succeeded by A. G. Black, chief of the Bureau of Agricultural Economics. The specific cause of controversy was said to be the wish of Secretary Wallace to make available for drought and rehabilitation work the \$600,000,000 in unused lending power possessed by the FCA. Mr. Hill maintained that such a policy would jeopardize the \$1,400,000,000 investment of banks and private investors in FCA bonds and that the credit program should not be confused with the farm-aid program. At the end of the year, Secretary Wallace announced a program for co-ordinating the activities of the various agencies in the Department in the effort to increase conservation.

See the separate articles on the following divisions: AGRICULTURAL ADJUSTMENT ADMINISTRATION; COMMODITY CREDIT CORPORATION; ENTOMOLOGY AND PLANT QUARANTINE, BUREAU OF; FARM CREDIT ADMINISTRATION; FARM SECURITY ADMINISTRATION; FEDERAL CROP INSURANCE CORPORATION; FEDERAL SURPLUS COMMODITIES CORPORATION; FOOD AND DRUG ADMINISTRATION. Other work of the Department is discussed under AGRICULTURE; DAIRYING; ELECTRIC LIGHT AND POWER; FORESTRY; LIVESTOCK; METEOROLOGY; and SOILS. For expenditures, see the table under PUBLIC FINANCE.

AIR CONDITIONING. Significant is the enactment by the 1939 legislature of North Carolina of an Act calling for licensing and regulation of air-conditioning contractors in that State. Designed to protect public health and safety, the law places the air-conditioning industry under the jurisdiction of the State Board of Examiners for plumbing and heating contractors. First examinations for applicants were held in Raleigh in August.

Typifying equipment development, a new 160-ton 4-unit electro-mechanical refrigerating plant installed to serve the air-conditioning system of a Chicago theater this year requires but 160 h.p. in motors and occupies 200 square feet of floor space as compared with the 1000 square feet required by the 15-year-old 200-ton 250-h.p. equipment that was displaced. A new 100-ton self-contained hermetically sealed unit using a motor built integrally with the compressor and cooled by the refrigerant gas is credited with 12 per cent better efficiency and 66 per cent less floor space than conventional belted units. Various technical contributions have been made toward the development of satisfactory and economical combined heating and air-conditioning equipment for domestic use. See also HEATING AND VENTILATING.

Air conditioning as an industry still is too young for statistics gathered to date to be either complete or particularly significant. Beginning with 1939, however, more effective efforts were made by the U.S. Department of Commerce, the Edison Electric Institute, and other interested agencies to collect and interpret statistics from all over the United States. This should facilitate more fruitful and revealing analyses in later years. Although not supporting important comparisons, the 1939 *incomplete* data do reveal vari-

ous interesting and significant facts, some of which will be touched upon briefly in the following paragraphs.

Partial data available indicate that air conditioning installations, in terms of the power required for their operation are distributed about as follows:

| | |
|--|--------|
| 1. Stores and miscellaneous commercial buildings | 24 % |
| 2. Theaters | 20 % |
| 3. Office buildings and individual offices | 17.5 % |
| 4. Restaurants, hotels, clubs, etc. | 14.5 % |
| 5. Industrial buildings, factories, etc. | 12 % |
| 6. Public buildings, government, etc. | 6.3 % |
| 7. Banks | 2.5 % |
| 8. Residences, including apartments | 2 % |
| 9. Hospitals | 0.6 % |
| 10. Broadcasting stations | 0.6 % |

The commercial group, represented by items 1, 2, 3, 4, 7, seems to be the most important for 1939, not only in installed capacity (approximately 78 per cent) but also in number of installations (approximately 76 per cent). In number of installations, the residential group comes next with about 18 per cent. Present trend in residential installations seems strongly toward the use of room-cooling units. Some 40-odd electric utilities reported about 7400 residential installations averaging about 2 h.p. each. Of these 7400 reported from all over the United States, it is interesting to note that more than 40 per cent are concentrated in 10 cities: St. Louis, Kansas City, Oklahoma City, Tulsa, Cincinnati, Houston, Dallas, Philadelphia, Baltimore, and Riverside (Calif.). New York and Chicago come in only for honorable mention.

Tentative results of studies into the use of air conditioning for the treatment of human ills seem to indicate important and significant possibilities for the future. For one thing, where air-conditioned operating and bed rooms have been used, post-operative complications have been reported as being well below normal.

In the field of vehicle cooling, at least one passenger automobile manufacturer has announced the availability of a mechanical air-conditioning unit as standardized "extra" equipment. Many of the new buses particularly for use in the Southwest and for long runs have been air cooled. It is estimated that there are about 400 such vehicles. In the railroad field, it was reported that as of July 1, 1939, a total of 11,350 cars had been air-conditioned, approximately 550 of them during the preceding 12 months. Present indications are that most of the existing cars which the railroads intend to air-condition have been completed, and that hereafter most such air-conditioning installations will be made in new cars as they are built. Most air-conditioned cars now in operation are on the through trains of trunkline railroads, but a Southern railroad has reported interesting success in the use of air-conditioned cars for inter-urban traffic in competition with highway buses.

AKRON, THE UNIVERSITY OF. A coeducational institution of higher learning in Akron, Ohio, founded in 1870 as Buchtel College and

taken over by the city and renamed in 1913. There were enrolled in the summer session of 1939, 440 students. For the autumn day session the enrollment was 1640 and for the autumn evening session, 1461. The faculty numbered 116. The income for the year, including tax levy from the city, was \$388,778. The library contained 52,370 volumes. The construction of a new student building was completed Nov. 10, 1939. President, Hezleton E. Simmons, Sc.D.

ALABAMA. Area and Population. Area, 51,998 square miles; included (1930) water, 719 square miles. Population: Apr. 1, 1930 (census), 2,646,248; July 1, 1937 (Federal estimate), 2,895,000; 1920 (census), 2,348,174. Birmingham had (1930) 259,678 inhabitants; Montgomery, the capital, 66,079.

Agriculture. Alabama harvested, in 1939, 7,850,600 acres of principal crops. On 2,037,000 acres, cotton, the main crop, made 780,000 bales (estimated value to the producer, \$34,710,000). The year's harvested acreage of cotton was less than three-fourths of the average for the decade 1928-37; the year's yield per acre, 183 lb., was also below the decade's average, though most other States giving up acreage had improved yield per acre. On 3,408,000 acres, corn gave 34,080,000 bu. (\$26,582,000); tame hay, on 840,000 acres, 596,000 tons (\$6,139,000); peanuts, 270,000 acres, 128,250,000 lb. (\$3,976,000); sweet potatoes, 110,000 acres, 8,800,000 bu. (\$7,040,000); potatoes, 45,000 acres, 4,860,000 bu. (\$2,916,000); oats, 132,000 acres, 2,838,000 bu. (\$1,476,000). Peaches gathered for market amounted to 1,705,000 bu. (\$1,449,000).

Manufacturing. Manufacturing establishments in Alabama numbered 1874 in 1937; employed 120,301 wage-earners (as against 94,345 in 1935); paid \$96,058,401 in wages (in 1935, \$60,643,479); produced goods to the value of \$573,763,522 (in 1935, \$257,226,162); and to the last-named sum, contributed, by manufacture, the value of \$237,435,861 (in 1935, \$146,583,916). The value of the output of cotton woven goods was \$87,327,487; of lumber and timber, \$31,915,650; of cotton yarn and thread, \$23,245,789; of blast-furnace products, \$39,629,075. Birmingham, the chief manufacturing city, had in 1937, establishments to the number of 287, employing 14,300 wage-earners, and producing in the year goods to the value of \$93,557,699.

Mineral Production. The 37 iron-ore mines active in 1938 shipped 4,281,332 gross tons of ore, as against 6,350,316 from 34 mines, for 1937; shipments by yearly value declined to \$7,341,620 (1938) from \$10,747,969 (1937). Blast furnaces' shipments of pig iron, produced chiefly from the State's native ore, declined similarly, to 1,990,342 gross tons (1938) from 2,528,785 (1937), and to \$29,190,091 from \$42,188,993. The red hematite ore forming nine-tenths or more of the iron ore produced was apt to contain nearly enough lime to provide its own fluxing; it averaged over 35 per cent in content of metallic iron. The coal mines' output diminished to about 10,950,000 net tons (1938), from 12,440,000, in value \$29,857,000 (1937). Byproduct coke ovens, using native coal almost wholly, yielded 3,374,898 net tons of coke (1938), as against 4,529,771, in value \$13,275,098, for 1937. Shipments of cement, approximating the annual production, totaled 4,548,079 barrels (1938) about the same as the 4,403,459 barrels of 1937; the totals by value were \$6,114,246 and \$6,165,974 respectively.

Education. Alabama's inhabitants of school age (from 6 to 20 years) were reckoned, for the academic year 1938-39, at 884,281. The year's enrollments of pupils in public schools numbered 691,319. This comprised 510,342 in elementary study and 180,977 in high school. Expenditures in the year 1937-38, for public-school education, came to \$21,132,741 in all; of this, \$18,425,496 was for current expense. Teachers in public schools numbered 19,005; their salaries for the year 1937-38 averaged \$673.

Legislation. The regular quadrennial session of the Legislature began on January 1. Both houses supported in the main the proposals of the incoming Governor, Dixon, for changes in the organization of the State government and for improving the system of taxation. The State's tax on sales, already in application but on a temporary basis, was not only made permanent but was rid of a flock of exemptions to its provisions, chiefly in favor of foodstuffs; by the calculations of Governor Dixon, the tax, after the removal of these exemptions, was to yield \$750,000 more a year than its established proceeds of \$5,500,000. In accordance with another proposal by the Governor an act was passed to prevent individuals and localities from escaping their share of the general tax on property; to this end the act supplanted the existing elected county boards of tax review with appointed tax-equalization boards. The State Tax Commission, composed of three members, was abolished and in its place was created a department under a single head. The Governor received authority to discharge executive appointees. Other bills authorized consolidations of divers of the State's governmental services. The session enacted provision for a system of civil service to cover the State's employees. The design and motto of the State's great seal were changed.

At the close of the regular session the Legislature reconvened, in special session (March 14) to consider seven proposed amendments to the State's constitution, recommended by the Governor for submission to the people. It rejected a proposal to requalify as voters those paying up two years' delinquent poll taxes; rejected legislative reapportionment; and approved some less disputed proposals. A measure requiring cities to negotiate for existing privately owned electric systems before building their own was adopted (August 15).

Political and Other Events. Frank M. Dixon, who took office as Governor January 16, had previously practiced law in Birmingham. He brought to his new position definite ideas and proposals for the advancement of Alabama; these had to do particularly with the State's economic position, both with regard to the rest of the Union and as to the State's internal organization of economic life. Dixon was able to obtain from the Legislature the enactment of a number of measures that he sought in connection with such proposals.

The Legislature's act removing from the State's great seal the motto "Here we rest" (see above) was preceded by an organized agitation for this change; the Alabama division of the Daughters of the Confederacy not only opposed the old motto on the usual ground that its wording was unhappy and failed to express the energetic habits of the population, but also brought forward material indicating that the motto had been the work of a Governor of the days of Reconstruction. Alabama's new great seal showed a simplified map of

the State and carried the motto "We dare defend our rights."

Athens College started (December 14) building a silk-hosiery manufactory at Athens; the first unit, to start operation early in 1940, was to give livelihood to 100 women students.

Economic Conditions. The improvement of business, month for month, as compared with 1938, was conspicuous and, for much of the year, above the average for other parts of the Union. For example, retail sales made in July were reported as exceeding those of July, 1938, by 17.3 per cent for Alabama, as against 7 per cent for all the States that furnished such figures. On the other hand the State's industrial prospects were regarded as deeply involved by the move of the Federal Wage and Hour Administrator setting the minimum of pay for textile workers at 32½ cents an hour. In hearings preliminary to such a ruling, Governor Dixon and other spokesmen for the State asserted (June 30) that the prohibition of work in the cotton mills at less than this pay would handicap the State's industry in relation to that of States where higher wages and lower freight rates prevailed.

An exceptionally heavy rainfall in southern and central Alabama (August 17) created floods in the Alabama River and its tributary the Cahaba. Several thousand people were estimated to have been driven from their homes by the water, many were marooned and had to be rescued, and several counties suffered the loss of a great part of the growing corn and cotton.

Officers. Alabama's chief officers, serving in 1939, were: Governor, Frank M. Dixon (Dem.); Lieutenant-Governor, A. A. Carmichael; Secretary of State, John Brandon; Treasurer, Charles E. McCall; Auditor, Howell Turner; Attorney-General, T. S. Lawson; Superintendent of Education, A. H. Collins.

ALABAMA, UNIVERSITY OF. A coeducational State institution for higher learning at University, Ala., founded in 1831. For the autumn term of 1939 the enrollment was 5300; the summer school registration was 2625. The faculty for 1938-39 numbered 407. The productive funds of the university amounted to \$4,875,123 and the income for the year was \$1,632,195. The library contained 220,568 volumes. In the past five years a building program involving a total expenditure of \$2,500,000 has been completed. President, Richard C. Foster, LL.D., D.C.L.

ALAND ISLANDS, REMILITARIZATION OF. See FINLAND and SWEDEN under *History*.

ALASKA. A non-contiguous territory of the United States; area, 586,400 square miles; inclusive of inland waters; population, 59,278 in 1930, 55,036 in 1920; whites (1930) numbered 28,640, Indians and Eskimos 29,983. Capital, Juneau, population (1930) 4043. Governor, John W. Troy (resigned August 29; see under *Events*, below).

Transportation. The Alaska Railroad, built and owned by the Federal Government, connects Seward, on the southern coast, with Fairbanks, on the Tanana River, to the north, thus linking the seaboard with the river routes of the Yukon basin. This railway's operations in the fiscal year ended with June 30, 1939, caused a deficit of \$19,831; the year's revenue was \$259,452 on 27,436 passengers and \$1,634,393 on 147,904 tons of freight, largely coal. In the absence of commonly traveled routes overland, ingress and egress were chiefly by sea; 19 passenger vessels

and 8 freighters that entered Alaskan waters in the year ended with June 30 carried 68,065 passengers, or thereabout. Highways built subsequently to 1901, according to Governor Troy's report issued November 30, aggregated only 2400 miles, but were supplemented by 9000 miles of tramways, sled roads, permanent trails, and temporary flagged trails; in proportion to the extent of the territory, roads were very scanty, and yet in proportion to the number of the population, Alaska had far more miles of highway than did the United States (Alaska, about 1 mile to 24 inhabitants; the States, as a whole, 1 mile to 43 inhabitants). The Governor's report held that the building of roads failed to keep up with the territory's requirements, despite the territorial government's having lately made the greatest of its appropriations for this purpose up to that time. At the Mount McKinley National Park, the count of visitors up to the end of September totaled 2262 for 1939, as against 1487 for 1938. The movement for the construction of a highway through Canadian territory, to connect Alaska with the United States was carried on in 1939; it offered the prospect not only of drawing more tourists and possible settlers but also of affording visitors, when they came, a better chance of seeing the area, since they could by this route best bring their own means of highway travel with them. Aviation more than ever served as the standard means of going quickly to and from remote settlements, notably mining camps; few as were the white population, the number of airplanes in commercial service was reported as about 175; that of fields prepared for their use, as 129. The Alaska Aeronautics and Communications Commission maintained in 1939 a system of reports by radio, on the weather. These reports, built on data from meteorological stations at Fairbanks, Nome, Cordova, Juneau, and Gravina Island, were radioed to help aviators.

Mineral Production. The value of the mineral production of 1938 was stated as \$28,607,000, of which gold furnished \$23,170,000. Of the gold obtained 36 per cent came from lode mines and 64 per cent from placer operations. Nearly two-thirds of the placer output was due to 44 dredging enterprises. Of other mineral production copper made up more than one-half and platinum nearly one-fourth.

Fisheries. The taking and packing of salmon, the chief part of the fishing industry and indeed the source of the greater part of yearly exports from the territory, suffered a severe decline in 1938. Not only did the quantity of salmon that was packed fall below that for 1937, but the estimated value of the shipments of salmon fell to \$37,190,961 for the fiscal year 1939, from \$42,677,210 for the year before. The early weeks of the salmon-packing season of 1939 showed no improvement over 1938, but results for the entire season were still to be reported at the year-end. The salmon-canneries at Ketchikan were disturbed in July by rival efforts of the C.I.O. and the A.F.L. to gain control of the labor. The shipments of fish other than salmon fell to the amount of \$6,411,852 for the fiscal year 1939, from \$7,547,815 for the year previous.

The depletion of the supply of salmon and also of herring caused the Department of the Interior to hold an inquiry in the territory in 1939, taking public testimony. In accordance with resulting recommendations from the Bureau of Fisheries the Secretary of the Interior drew up regulations

designed to cut down commercial taking of salmon in the Bristol Bay area in 1940 by one-half, in order to offset the diminution in the run of red salmon said to occur chiefly in the years of which the numbers were divisible by five; also to prohibit fishing for herring, except in some minor ways, in southeastern Alaska. See FISHERIES, BUREAU OF.

Political and Other Events. Governor Troy resigned, August 29, for the stated reason of ill-health, and his service as Governor ceased on October 15. The President recommended to the Secretary of the Interior the appointment of Ernest H. Gruening to succeed Troy. This proposal drew a protest from Alaska's Territorial Delegate, Anthony J. Dimond, who advocated the appointment of a resident. No nomination was sent to the Senate; and after the adjournment of Congress the President let it be understood that no nomination would be made for the time being. Gruening's appointment was finally announced, November 16.

Efforts to push the growth of the Alaskan population became increasingly the Territory's concern. The very sparsity of the population hindered economic and social development; this hindrance worked in divers ways more or less analogous to the already-noted paradox, of roads abundant in proportion to the fewness of people, yet scant as means for these people's intercommunication over great distance. Many Alaskans hoped to advance the fortunes and numbers of their community by the demand for the appointment of a resident as Governor; an Alaskan, it was felt, would know best what was wanted. The demand for Statehood, a long-sought ambition, aimed farther along the same course; its realization would give not only a resident for Governor, but a resident chosen at the Alaskan polls and subject to local instead of Federal control. Governor Troy's last annual report, issued late in 1939, did not recommend Statehood, but went part way, by urging that the Federal Government definitely bestow on Alaska, through a territorial organic act, "those primary rights of self-government which are contained in the organic acts of earlier territories." The Alaska Home Rule Association issued, March 16, a demand for immediate full territorial status and later Statehood.

From outside Alaska, though not necessarily without approval from that quarter, there appeared in Congress a proposal for augmenting the Alaskan population and at the same time harboring a great group of people not wanted elsewhere. Senator Gibson of Vermont wrote this plan into a bill and introduced it in the Senate, June 29. The bill would admit into Alaska colonists of any nationality, if they would give up former allegiance and if they had not engaged in subversive activity. The pressure of immigration coming at the time—refugees fleeing lands overrun by arms or purged by dictators—made this measure one, above all, for switching refugees into Alaska.

The Federal experiment in colonization in the Matanuska valley continued to provide incident. The official connection with this colony had passed to the Department of the Interior in September, 1938; there followed, Oct. 30, 1938, a report that about 86 families of colonists had left or were leaving; the House of Representatives' committee on appropriations gave out, Mar. 8, 1939, testimony from Secretary of the Interior Ickes in a recent hearing, that he had ordered the supervisors to expel from the colony those disin-

clined to work. On August 4 a dispatch from Anchorage reported that the Government, after several months of litigation, had bought out a colonist, Walter A. Pipple, thus ridding the colony of a farmer who had made a desirable income by selling his own products, opposing attempts to make him sell through the colony's co-operative organization. A heavy snow (12 inches or more), October 8, fell on the colonists' partly unharvested grain, hay, potatoes, and cabbages, raising apprehensions of their losing much of the year's return.

ALBANIA, ăl-bă'ni-ă. A former Balkan kingdom on the east shore of the Adriatic Sea, annexed by Italy on Apr. 8, 1939. Area, 10,629 square miles; population, estimated at 1,120,000 on Mar. 31, 1937 (1,003,124 at 1930 census). Capital, Tirana (pop. 30,806 in 1930); other chief towns, Scutari (Shkodër), 29,209; Koritsa (Korçë), 22,787; Elbasan, 13,796; Durazzo (Durrës), the chief port, 8739.

Education and Religion. Illiteracy is high. In 1938 there were 2108 pupils in infant schools, 54,532 in 623 state primary schools, 5677 in 17 intermediate schools, and 459 Albanian students in various foreign universities. By religion, the Albanians are divided as follows: Moslems, 688,280; Orthodox Christians (Church of Albania), 210,313; Roman Catholics, 104,184.

Production. Agriculture and stock raising are the main occupations. The principal products are corn (141,300 metric tons in 1938), tobacco (2100 metric tons, 1938), wool (2300 metric tons, 1937), timber, hides, dairy products, fish and olive oil. The 1938 harvest of other cereals was (in metric tons): Wheat, 44,900; barley, 4200; rye, 3300; oats, 11,300. Some cotton, potatoes, and fruit are grown. Albanian petroleum production (estimated capacity, 300,000 tons in 1939) is refined in newly opened hydrogenation plants in Leghorn and Bari, Italy, and is capable of supplying half of Italy's peace-time gasoline requirements. Copper, lignite, salt, and bitumen are produced in small quantities. There are considerable untapped mineral resources. Manufacturing is confined largely to the preparation of flour, olive oil, and cheese.

Foreign Trade. Imports in 1937 were valued at 20,315,687 gold francs (16,777,691 in 1936); exports, 10,175,065 (7,434,621). Italy supplied 4,881,000 francs of imports in 1937 and took exports to the value of 7,998,357. The chief imports were cotton and cotton textiles, corn, benzine, woollen goods, and petroleum; chief exports, wool, hides and furs, cheese, cattle, eggs, and timber.

Finance. Budget estimates for the fiscal year ended Mar. 31, 1939, placed revenues at 28,565,400 gold francs and expenditures at 28,235,400. Under a monetary union with Italy established Apr. 20, 1939, the value of the Albanian gold franc was fixed at 6.25 lire per franc. The public debt in 1938 was 68,200,000 gold francs, representing the amount outstanding of a series of loans extended by Italy in return for political and economic concessions (see 1938 YEAR BOOK, p. 27, for details).

Transportation. There are no railways. The road network at the beginning of 1939 comprised 1240 miles, of which about 745 miles were automobile highways and the remainder local roads. Italy has a monopoly of Albanian air services, which connect Tirana with Rome, Salonika, Scutari, Koritsa, Valona, and other towns.

Government. Zog I was proclaimed King Sept. 1, 1928, after having been President of the Albanian Republic since Jan. 31, 1925. He ruled dictatorially with the aid of Italian advisers, a

Council of Ministers and a hand-picked unicameral parliament of 58 members. An Italian-Albanian defensive alliance was concluded Nov. 22, 1927. For the regime established by Italy in 1939, see *History*.

HISTORY

Friction with Italy. Mussolini's plans for establishing complete Italian domination in Albania encountered growing resistance from King Zog in 1938 and 1939. During preceding years Zog had acquiesced, under pressure and in return for Italian loans, in the gradual extension of Italian economic and political control (see preceding YEAR BOOKS). But he stubbornly resisted Italian efforts to create a Fascist movement in Albania, calculated to overcome the obstructions encountered at Tirana and bring about more effective collaboration with Rome.

During the European crisis of September, 1938, over Czecho-Slovakia, King Zog was reported to have approached Great Britain and France with an offer to denounce his Italian alliance and bar Italian troops and ships from his territory and ports in case of a Mediterranean war. As the Italians were bound by the 1927 treaty not to interfere directly in Albanian internal affairs, they undertook to promote a revolt against Zog, hoping to secure a government at Tirana more amenable to Italian wishes.

In February of 1939 King Zog learned of the plot. He expelled Giovanni Giro, the Fascist agent who had been preparing the revolt by bribery and anti-Zog propaganda among the Albanian tribes. At the same time some Italophile Albanians were arrested for participation in the plot. The Italian Minister at Tirana then informed the King that unless the prisoners were released, Italy would denounce its alliance with Albania. Realizing that his throne was in danger, Zog asked British help against an Italian attack. At the same time he sought to reach an agreement with Mussolini that would permit him to retain his position. Before the negotiations with Britain had reached a definite conclusion, the German seizure of Bohemia and Moravia and the exigencies of Italy's domestic and international position led Mussolini to act. Rising opposition to Zog's rule in Albania also made the time opportune. It was widely charged that the King and his associates at Tirana were looting the public treasury and diverting into their own pockets the proceeds of the Italian loans. Italian agents fanned this discontent and helped to produce the disorganization that attended the subsequent Italian onslaught. Reports of attacks upon Italians in Albania provided a pretext for action.

The Italian Invasion. On Apr. 7, 1939 (Good Friday), some 35,000 Italian troops were landed from 100 naval vessels at the Albanian ports of Durazzo, Valona, Santi Quaranti, and San Giovanni di Medua. Supported by naval bombardments and demonstrations by Italian air squadrons, the invaders soon crushed the resistance offered by part of the small Albanian army and in a few days overran the entire country. The King and his Ministers fled across the Greek border, leaving those Albanians who wished to resist virtually leaderless. The Italians reported their losses at 12 killed and 53 wounded. Neutral sources placed the Albanian losses at several hundred.

Political Union with Italy. The Italians proceeded immediately to incorporate Albania in their empire politically, economically, and from a mili-

tary point of view. On April 8 Albania was formally proclaimed an Italian protectorate. Four days later a hand-picked Constituent Assembly convened at Tirana under Italian auspices and passed a resolution abrogating the existing constitution and regime, forming a new government headed by Premier Shevket Verlaci, and offering the Crown of Albania to King Victor Emmanuel of Italy. The offer was accepted by the Fascist Grand Council in Rome the following day and a personal union between the two countries was thus effected.

The Italian Minister in Tirana, Francesco Jacomini di San Savino, was appointed Victor Emmanuel's provisional Lieutenant-Governor in Albania. On June 3 King Victor Emmanuel presented to an Albanian delegation in Rome a constitutional statute eliminating the last vestige of Albanian political independence. The Albanian throne was made hereditary under Victor Emmanuel's dynasty. Legislative, executive, and judicial power was vested in the King of Italy. He delegated his legislative power to a Superior Fascist Corporative Council, based upon a newly organized Albanian Fascist party. The King was empowered to convoke and adjourn the Council and appoint its President and Vice President. All legislation was to be approved by open voting and the King's approval was required before any law could go into effect.

The King's executive and judicial powers were likewise delegated to Albanian officials appointed by him and acting under Italian guidance. Albanian was retained as the official language. All religions were to be respected. On the same date a treaty was signed authorizing Italy to take over the Albanian diplomatic services, with the result that all foreign legations at Tirana were closed. At the same time the new Albanian Premier petitioned Victor Emmanuel to incorporate the Albanian military forces in the Italian army. Another accord provided that Italians in Albania and Albanians in Italy were to enjoy the same civil and political rights as in their own countries. Meanwhile on April 14 Albania had followed Italy's example in resigning from the League of Nations.

Economic Co-ordination. The integration of Albanian economic resources and activities with those of Italy was accomplished by the accord signed April 20 at Tirana. This provided for an Italo-Albanian customs, monetary, and economic union. Under it the Italian tariff, import, and export restrictions and general system of foreign trade control were applied to Albania. The Tirana government undertook to facilitate Italian enterprises that served to develop Albania economically. Each country retained autonomy with respect to internal taxation, and existing production, import, export, and sales monopolies remained in force, subject to negotiation.

An exchange monopoly was set up in Albania and administered by the Albanian National Bank in conformity with Italian laws and regulations. The Albanian gold franc was pegged to the lire. Italian bank notes or credits of the Bank of Italy became coverage for the note circulation of the Albanian National Bank. The Italian customs service took over the administration and control of all customs operations in Albania. As compensation for the loss of customs revenue, the Italian Government obligated itself to pay the Tirana Government 15,000,000 Albanian francs (nearly \$5,000,000) annually, plus the amount by which

Albanian customs collections exceed 9,000,000 francs in any one year. Albania undertook to terminate all her commercial treaties and economic agreements with other countries as soon as legally possible and permit Italy to negotiate all future agreements and treaties of this nature.

To promote the economic development of the country the Italian Government in June appropriated 1,200,000,000 lire for land reclamation and 800,000,000 lire for road construction in Albania, to be expended over eight years. About 500,000 acres of seasonally flooded lands along the Adriatic coast were to be reclaimed. The highway system was to be extended, partly in order to promote economic development of the country. Plans were laid for Italian exploitation on a more intensive scale of Albanian mineral, water-power, forest, and agricultural resources. On October 11 the Italian Under-Secretary for Albanian Affairs reported that 25,000 natives and 1500 Italians were at work on motor roads, aqueducts, and port improvements in Albania.

Military Activities. The primary purpose of the new Albanian highway program was strategic. In June Marshal Pietro Badoglio, Chief of the Italian General Staff, was sent to Albania to transform it into a base for Italian military operations in the Balkans. He laid out the new highway system and organized the Italian army of occupation, reported in August to number about 90,000 men. The main troop concentrations were along the Greek frontier. The cost of Italian military activities was indicated by the decree of Apr. 9, 1939, appropriating 280,000,000 lire for the Ministries of War, Marine, and Aeronautics to cover military expenses in Albania during the fiscal year ended June 30, 1939.

Italian Methods of Control. According to the Balkan correspondent of the London *Times*, the Italians resorted to bribery and friendly treatment of those Albanians who did not resist invasion in order to consolidate their control. Cash gifts were distributed to Albanians joining the new Fascist party. All officers of the Albanian army and the higher government officials who co-operated with the invaders received a bonus of two months' salary. Wages of laborers were raised substantially through a minimum wage law. Upon orders from Mussolini, 190,000 gold francs were distributed among the poorer classes in Albania soon after the military occupation. The entire Albanian civil and diplomatic services, continued to draw their salaries, although they had little if any work to do. But despite Italian generosity, many Albanians appeared unreconciled to the loss of their national independence.

King Zog in Exile. On Apr. 4, 1939, three days before the Italian invasion, a son was born to King Zog and Queen Geraldine. The Queen and the infant Crown Prince were sent by automobile to Greece when the Italians landed, and the King later joined them there with a large suite. On May 3 they arrived in Istanbul, Turkey, and later in the year they settled in Stockholm, Sweden.

See GREAT BRITAIN, GREECE, ITALY, AND YUGOSLAVIA under *History*.

ALBERTA, ăl-bŭr'tă. A prairie province of western Canada. Area, 255,285 square miles; population (June 1, 1939 estimate), 789,000 compared with (1936 census) 772,782. Chief cities (1936 census figures in parentheses): Edmonton (85,774), Calgary (83,407), Lethbridge (13,523), Medicine Hat (9592). During 1938 there were 15,881 births, 5870 deaths, and 6973 marriages.

Education (1936-37): 178,507 students in elementary and secondary schools, and 2798 students of university grade.

Production. The gross value of agricultural production for 1938 was \$167,066,000. Crops produced in 1939 (1938 figures in parentheses) included wheat 145,000,000 bu. (143,000,000), oats 77,000,000 bu. (101,000,000), barley 25,000,000 (29,200,000), rye 2,891,000 bu. (2,700,000), flax-seed 300,000 bu. (250,000), hay and clover 549,000 tons (545,000), and sugar beets 270,000 tons (251,000). The total value of field crops in 1939 was \$114,017,000. Livestock in the province (1939): 1,337,400 cattle, 903,200 swine, 834,300 sheep, and 658,600 horses. Furs produced in 1936-37 totaled 2,068,118 pelts valued at \$2,161,507. The output of the forests in 1937 was equivalent to 105,646 M cu. ft. and the value of the products therefrom was \$3,196,988. Fish caught during 1938 were valued at \$492,900.

Mineral production (1938) was valued at \$28,966,272 of which coal (5,251,233 tons) accounted for \$13,698,470; crude petroleum (6,751,312 bbl.), \$8,775,094; natural gas (21,822,108 M cu. ft.), \$4,807,346. The 895 factories, with a total of 12,524 employees, had a net value of production of \$28,923,095 for 1937.

Government. For the fiscal year ended Mar. 31, 1939, revenue totaled \$24,269,817; expenditure, \$21,242,625; net public debt, \$125,917,194. The King is represented by a lieutenant-governor (appointed by the Governor General in Council) who is aided by a ministry of 8 members which is responsible to the legislature and resigns office when it fails to hold the confidence of that body. There are 63 members in the legislature (including the ministry) all elected by direct vote of the people (at the provincial general election of 1935, 56 Social Credit, 5 Liberal, and 2 Conservative members were elected). Six senators (appointed for life) and 17 elected commoners represent the province in the Dominion parliament at Ottawa. Lieut.-Gov., J. C. Bowen (appointed Mar. 20, 1937); Premier, William Aberhart (Social Credit).

History. An order in council issued by the Governor General in Council on Mar. 25, 1939, disallowed "An Act to amend the Limitation of Actions Act, 1935" which provided that actions on debts contracted before July 1, 1936, must be brought before July 1, 1940, unless the debtor enters into a new agreement in writing. On Sept. 12, 1938, a board was created for the establishment of credit houses in Alberta which now perform all the functions of commercial banks except the granting of loans. Total deposits are not very large but are expected to increase because 25 per cent of all provincial salaries are paid in transfer vouchers which can be negotiated only through credit houses and their merchant members. Deposits may be made either in currency or transfer vouchers. See CANADA.

ALBERT CANAL. See BELGIUM under *History*.

ALCOHOL. See ALCOHOLIC BEVERAGES; FEDERAL ALCOHOL ADMINISTRATION.

ALCOHOLIC BEVERAGES. According to the report of the Commissioner of Internal Revenue, the total United States production of distilled spirits for the fiscal year ending June 30, 1939, was 145,326,176 tax gallons, a decrease of 3.2 per cent from 1938. This figure included by kinds: whisky, 93,003,917 tax gallons; rum, 2,442,689; gin, 6,279,119; and brandy, 27,446,296.

Brandy production was almost 5,000,000 tax gallons higher than in 1938, but whisky production was reduced by 9.6 per cent. On June 30, 1938, the stocks of whisky two years old or older amounted to 170,131,686 tax gallons, whereas on June 30, 1939, similar stocks had increased to 297,106,761 tax gallons.

During the year 43,401,295 proof gallons of rectified products were produced, including whisky, 33,593,409; gin, 7,231,564; cordials and liqueurs, 2,192,964. This represented a decrease of approximately 150,000 gallons from the figure for the preceding year. The quantity of whisky rectified showed an increase, but rectified gin production declined more than 500,000 proof gallons.

Production of fermented malt liquors totaled 53,870,553 bbl. (of 31 gal.), a decrease of 4.4 per cent from 1938. Still wine production was the greatest of any fiscal year, 231,959,287 wine gallons. Production of cereal beverages was 1,966,795 gallons; sparkling wine, 6,683,762 half-pint units; vermouth, 206,184 wine gallons. The consumption of domestic sparkling wine decreased by 12.3 per cent.

In the production of distilled spirits during the year, distillers utilized 1,327,113,343 lb. of grain, 4,314,729 gal. of molasses, 42,224,939 lb. of fruit, and 170,863,640 gal. of fruit wine, cider, and juice. The year's production of fermented malt liquors required 1,938,177,252 lb. of malt; 415,689,330 of corn; 198,317,295 of rice; 150,765,190 of sugar and sirups, and 32,462,163 of hops and hop extract.

No figures are available, of course, on illicit liquor production. During the fiscal year, 12,059 stills were seized, having an aggregate mash capacity of 1,895,277 gal. and in connection therewith 8,076,461 gal. of mash were seized and destroyed. The investigators also seized 336,268 gal. of spirits and 4556 automobiles and trucks. The total appraised value of the property seized amounted to \$2,222,899. A total of 28,844 persons were arrested. See **FEDERAL ALCOHOL ADMINISTRATION**.

ALEXANDRETTA, SANJAK OF. See **SYRIA** and **LEBANON** and **TURKEY** under *History*.

ALFALFA. See **HAY**.

ALGERIA. A French colony in North Africa, with an area of 847,870 square miles, of which all except 222,206 square miles are desert. Capital, Algiers (Alger). Estimated population, Jan. 1, 1938, 7,400,000. At the 1936 census there were 7,234,684 inhabitants (6,592,033 in the Northern Territory and 642,651 in the Southern Territory). The total European population was 987,252, of whom 853,209 were French citizens and 134,043 foreigners. The native population, entirely Moslem, numbered 6,247,432. Populations of the chief cities (1936) were: Algiers, 264,232; Oran, 200,671; Constantine, 113,777; Bona (Bône), 86,332; Philippeville, 66,112; Sidibel-Abbes, 54,754. For non-Moslem education, there were in 1937 128 infant schools, with 21,327 pupils; 1210 primary schools, with 157,088 pupils; 29 higher primary schools, with 8864 pupils; 17 secondary schools, with 13,517 pupils; and a university at Algiers, with 2224 students. For Moslem education, there were 681 schools, with 73,023 pupils.

Production. Agriculture and stock raising are the chief occupations. Yields of the chief cereal crops in 1938 were (in metric tons): Wheat, 951,000; barley, 581,100; rye, 1100; oats, 158,100; corn, 4300. The olive oil output in 1938-39 was 5900 metric tons; potatoes (1938), 145,300; tobacco, 19,100; wool and mohair, 7400; wine, 21,-

490,000 hectoliters (hectoliter equals 26.42 U.S. gal.). Livestock in 1938 included 5,965,000 sheep, 2,737,000 goats, 181,000 horses, 319,000 asses, 789,000 cattle, 182,000 mules, and 170,000 camels. The fish catch in 1936 was valued at 51,750,000 francs. Exports of the principal minerals in 1938 were (in metric tons): Iron ore, 2,754,614; antimony, 14,194; phosphate rock, 485,579; zinc ore, 8327; lead, 8860.

Foreign Trade. Imports in 1938 totaled 4,666,565,000 francs (4,083,383,000 in 1937); exports, 5,649,701,000 francs (4,333,599,000). Over 80 per cent of both the import and export trade was with France. Average exchange value of franc, \$0.029 in 1938, \$0.04 in 1937. See **IMPORTS AND EXPORTS**.

Finance. The 1939 budget estimates placed total revenues at 2,673,296,207 francs (ordinary, 1,910,051,207); expenditures, 2,673,073,306 francs (ordinary, 1,909,828,306).

Transportation, etc. The 3048 miles of railway line open for traffic in 1937 carried 748,000,000 ton-kilometers of goods and earned a gross income of 279,535,227 francs. Air lines connect Algiers with Oran, Tunis, Marseille (France), Brazzaville (French Congo), and Elizabethville (Belgian Congo). The net tonnage of vessels cleared from Algerian ports in 1938 was 7,164,000; tonnage entered, 7,920,000. See **ROADS AND STREETS**.

Government. Administration is centralized in the hands of the Governor-General appointed by the French Government, with the exception of the non-Moslem services which are administered by the appropriate Ministries at Paris. The departments of Algiers, Oran, and Constantine in Northern Algeria are represented in the French Parliament by a total of 10 deputies and 3 senators. Southern Algeria has a French military government. Governor-General in 1939, M. Le Beau, appointed Sept. 21, 1935.

History. The nationalist agitation in Algeria and the other French North African possessions was largely suspended during 1939 as a result of the European crises and the overwhelming support which native Moslems accorded France in her quarrel with Italy and her war with Germany. The crisis of September, 1938, over Czecho-Slovakia brought professions of loyalty to France from the entire Moslem population. This sentiment was greatly reinforced by the Italian claims to Tunisia made in December, 1938, and the subsequent visit of Premier Daladier to North Africa early in January, 1939. He was received with warm acclaim by all sections of the native population, which displayed deep resentment at the Italian imitation of the Nazi racial policy and at the reported ousting of Moslems from their lands in Italian Libya (q.v.) to make room for Italian settlers.

Italy's annexation of Moslem Albania in April, 1939, aroused great indignation in French North Africa, expressed in large protest meetings in Constantine, Oran, Bona, Philippeville, and other cities and towns. The Moslem chiefs and religious leaders of Algeria, Tunisia, and Morocco, in their annual meeting late in April, passed a resolution affirming loyalty to France and denouncing "the despotic ambition of one [Mussolini] who has dared, with a theatrical gesture, to describe himself as the Protector of Islam."

Throughout the year the French authorities pushed their preparations to defend the North African colonies against a threatened Italian drive from Libya and a possible attack from

Spanish Morocco. Work was rushed on the construction of the naval and air base at Mers-el-Kebir near Oran, and the strengthening of the Mareth line of fortifications guarding the Tunisia-Libya frontier. The garrison of Algeria and Tunisia, which totaled 83,000 men and 3000 officers in 1937, was greatly reinforced. See FRANCE and ITALY under *History*.

ALIENS. See IMMIGRATION AND EMIGRATION.

ALLEGHENY COLLEGE. A coeducational institution of higher learning in Meadville, Pa., nonsectarian in policy but under the patronage of the Methodist Church; founded in 1815. The enrollment for the autumn of 1939 was 711 in addition to 108 in the evening session and for the summer session 123. The faculty numbered 51 members. The productive funds of the college amounted to \$1,500,000, and the income for the year 1937-38 was \$484,000. The Reis Library contained 130,000 volumes. President, William P. Tolley, Ph.D., D.D., Litt.D., LL.D.

ALLIANCE FRANÇAISE, FÉDÉRATION DE L' An association of clubs and groups, formed in 1902 for the purpose of encouraging and furthering the study and cultivation of the French language, literature, art, and history in the United States and Canada. By 1939 it comprised more than 290 local branches, including alliances, affiliated societies, and clubs in universities, colleges, and schools.

Each year the Alliance Française brings from France one or more lecturers who are prepared to speak before all the affiliated societies and clubs wishing to hear them. The official lecturer for the season 1938-39 was Mr. Henri Molherbe, novelist, lecturer, and authority on music. The regional lecturers were Messrs. Jean Albert Bédé and Paul Périgord. The Fédération also organizes lecture tours for distinguished French travelers and French lecturers who live in America, assists in organizing courses in the French language and literature in co-operation with the leading universities, and encourages its groups to engage in dramatic performances and debates in French. Its Assemblée Générale, attended by representatives of the various groups, was held in New York City, Apr. 15, 1939. The official periodical is *L'Echo de la Fédération*.

The officers in 1939 were: President, Frank D. Pavey; general vice president, Roger Sherman; president of the executive committee, Albert Blum; treasurer, John F. Daniell; general secretary and director of lectures, Pierre A. Bédard. Headquarters: 22 East 60th St., New York City.

ALSACE-LORRAINE. The provinces transferred from Germany to France, as from the date of the Armistice of Nov. 11, 1918, by the Treaty of Versailles (June 28, 1919). They are now known as the Bas-Rhin, Haut-Rhin, and Moselle departments of France. Total area, 5605 square miles; total population (1936 census), 1,915,627. See FRANCE under *History*.

ALUMINUM. This metal is widely distributed in the Earth's crust, but mineral deposits of economic value are limited in geographical occurrence. France is the largest producer of bauxite, the principal ore, with Hungary, Yugoslavia, Italy, Surinam, and British Guiana following in that order. The chief sources of bauxite in the United States are the States of Alabama, Arkansas, and Georgia. Shipments from these States in 1939 totalled 369,000 long tons valued at \$2,174,000, an increase of 19 per cent in quantity and 20 per cent in value compared with 1938.

In the production of aluminum, however, Germany took first place in 1938, United States second, Canada third, and Russia fourth. In 1938 the world industry set an all-time record production of 633,650 tons of aluminum, exceeding the 1937 record by nearly 20 per cent. World production for 1939 is estimated at 686,500 tons, United States production being about 163,500 tons.

Because of their strength and lightness aluminum alloys are widely used in the manufacture of aircraft, automobiles, and other forms of transport, mine skips, and cages. The importance of aluminum in the manufacture of aircraft led the United States in December to lay a "moral embargo" on exports of the metal to those countries engaging in "unprovoked bombing and machine gunning of civilian populations."

Open market price for carload lots of virgin aluminum ingots in New York remained uniform at 20¢ per lb. in 1939 and 1938.

In December, 1939, the Aluminum Company of America, largest domestic producer, announced the signing of a contract with the Bonneville Power Administrator for a substantial block of power for the production of 30,000,000 lb. of aluminum annually at a new plant to be constructed near Vancouver, Wash. Combined with the company's four existing plants, this will bring its total productive capacity to more than 400,000,000 lb. per annum. The company reported that its total sales volume in 1939 was the largest in its history. See METALLURGY.

H. C. PARMELEE.

AMATEUR ATHLETIC UNION OF THE UNITED STATES.

An organization formed in 1888 and for the improvement and promotion of athletic sports and games among all amateurs. Its unit of organization is the athletic club, educational institution or other bona fide amateur athletic organization. The Union recognizes all amateur sports and claims jurisdiction over the following classes: All track and field events, basketball, boxing, gymnastics, handball, swimming, tug of war, wrestling (catch-as-catch-can and Greco-Roman), weightlifting, volley ball, indoor baseball, code ball, field handball, bob sleighing and coasting, ice hockey, and horseshoe pitching.

Membership in the A.A.U. is limited to bona fide clubs, educational institutions or other organizations of a permanent character actively promoting and (or) participating in amateur sports and games. No organization whose interest in amateur sports is purely commercial is eligible for membership and any income derived from the promotion of any sport by members of the A.A.U. must be used for the further promotion of amateur sport, for an approved charity or for the general welfare of the organization as a whole. Club members of associations pay yearly dues of \$7.50 of which \$2.50 goes to the national body.

The Union sponsors championship meets in the various sports over which it has jurisdiction, has taken the lead in America's participation in the Olympic Games, and has been instrumental in organizing the Public Schools Athletic League of New York and similar leagues in other sections of the country. It publishes an official monthly, *The Amateur Athlete* and issues *Official Athletic Rules and Official Handbook of the Amateur Athletic Union of the United States*.

The officers in 1939 were: President, Samuel

E. Hoyt; secretary-treasurer, Daniel J. Ferris. Headquarters: 233 Broadway, New York, N. Y.

AMBASSADORS AND MINISTERS. The accompanying table lists the diplomatic representatives accredited to and from the United States, as reported in the Department of State's *Diplomatic List* for December, 1939, and *Foreign Service List* for the last quarter of 1939. The abbreviations following the names are to be interpreted as follows: (A), Ambassador extraordinary and plenipotentiary; (E), Envoy extraordinary and minister plenipotentiary; (C), Consul general.

over the preceding year. This total membership represents a gain of 1,566,299 dues-paid members since 1936 when the ten international unions which formed the C.I.O. were suspended. The substantial membership gains which have been made during this period were due largely to intensive organizing campaigns and the economic enfranchisement of American workers under the National Labor Relations Act. This enlargement, with its widespread broadening of collective bargaining, was achieved in the face of opposition from many employers and bitter rivalry from the C.I.O.

DIPLOMATIC REPRESENTATIVES BETWEEN THE UNITED STATES AND FOREIGN COUNTRIES, 1939

AMERICAN ASSOCIATIONS AND SOCIETIES. For various scientific and other organizations, whose official titles begin with the word American, see under the important descriptive word of the title, except in the cases of AMERICAN FEDERATION OF LABOR and AMERICAN LEGION.

AMERICAN DEMOCRACIES, INTERNATIONAL CONGRESS OF. See DEMOCRACY.

AMERICAN FEDERATION OF LABOR. The American Federation of Labor in 1939 achieved the peak membership in its fifty-nine year history. The dues-paid membership as of August, 1939 was 4,006,354, a gain of 383,267

With its increased economic power, the American Federation of Labor through its affiliated unions was able during the year to maintain and improve wage levels while steadily reducing the hours of work per week.

The great majority of A. F. of L. unions enjoy contractual relations with employers in their respective trades and the provisions of these contracts were lived up to by the unions. There was not a single major strike conducted by a national or international union affiliated with the American Federation of Labor in 1939. This is a remarkable record and attests to the efficacy of collective bargaining. Such strikes as did occur in

1939 involving A. F. of L. unions were local in character and did not tend to dislocate industry or retard national recovery. See LABOR CONDITIONS; RELIEF.

Legislation Favored. In the field of legislation organized labor made some gains during 1939 but also suffered serious reverses. Congressional action at the last session favored by labor included:

1. Amendments to the Social Security Act providing for liberal pensions for several groups, advancing for two years date when old age pensions will take effect, adding approximately 1,000,000 persons to those already covered, and maintaining for the next three years the 1 per cent employee-employer old-age pension tax.
2. Appropriation of \$50,000 for the Civil Liberties Committee to complete investigations on the west coast.
3. Beneficial amendments to Employers' Liability Act of 1908 applicable to railroad men and seamen.
4. Amendments to naturalization law enabling a person to qualify for citizenship who entered the United States prior to July 1, 1924, even though there is no record of permanent admission.
5. Extending to Dec. 31, 1940, the time in which Filipinos will be provided free transportation to their native land.
6. Appropriation of \$1,200,000 for Wage and Hour Administration after the House refused any appropriation.
7. Appropriation of approximately \$2,000,000,000 for national defense.
8. Appropriation of \$1,477,000,000 for relief.
9. Postal substitutes granted vacation and sick leave.
10. Government employees who work a five-day week have heretofore had Saturdays counted in their leaves. Hereafter Saturdays, Sundays, and holidays will not be counted in their annual and sick leaves.
11. Providing for the payment of pensions to beneficiaries after the death of a government employee.
12. Extending the life of the C.C.C. until July 1, 1943.
13. Requiring shipowners to deposit such portions of a seaman's wages as may be stipulated, in a savings bank or a United States postal savings depository.
14. Load lines made applicable to foreign-going American vessels of 150 tons or over.
15. Secured amendment to bill enlarging Panama Canal to provide all positions (approximately 3000) of skilled, technical, clerical, administrative or supervisory class be filled by citizens of the United States.
16. Secured passage of bill to permit appointment of midshipmen to the Naval Academy from sons of civilian employees of the government in the Canal Zone.
17. Appropriation of \$1,325,000 for the purchase of surplus products of the fishing industry to be distributed to persons on relief.
18. Permitting Home Owners Loan Corporation to extend amortization of loans from 15 to 25 years.
19. Defeated provision in the National Defense Act providing that the manufacture of educational airplanes would not come under the Walsh-Healey Act which would permit the employment of cheap and incompetent labor.
20. Defeated amendments to Wage and Hour Law that would have exempted more than 2,000,000 workers from its provisions.
21. Defeated bills that would permit certain Asiatics ineligible to citizenship to be naturalized, which if they became laws would have ultimately opened our ports to nationals of all Asiatic countries now denied admission for permanent residence.

Legislative Reverses. Labor reverses in Congress were:

1. Elimination of the prevailing wage clause from the relief program.
2. Failure to take action upon amendments proposed by the American Federation of Labor for improving the administration of the National Labor Relations Act.

Additional reverses were experienced in State legislatures. Repressive labor legislation and amendments restricting and limiting existing labor laws were adopted in several States and proposed in many others. This reactionary trend was directly traceable to resentment against sit-down strikes and other similar activities.

Finances. The American Federation of Labor held its Fifty-ninth Annual Convention in Cincinnati, Ohio, Oct. 2-14, 1939. To this Convention Secretary-Treasurer Frank Morrison submitted his annual financial report. It showed that the

total revenue of the American Federation of Labor for the fiscal year ended Aug. 31, 1939 was \$1,800,249. This sum, added to a balance of \$443,631 from 1938 brought the total funds on hand during the year to \$2,243,880. Total expenditures for the year were \$1,697,376, leaving a balance on hand on Aug. 31, 1939 of \$546,504.

The revenue of the American Federation of Labor is chiefly derived from a per capita tax of one cent per member per month, paid to the Federation by its affiliated unions. In addition, a special assessment of the same amount was levied during 1939 for the purpose of raising funds to expand organizational campaigns. During the twelve months ended Aug. 31, 1939 the American Federation of Labor spent \$889,549 for organizing activities. The complete financial report for the year is a public document which can be obtained at the Secretary-Treasurer's office of the American Federation of Labor.

Affiliations. The American Federation of Labor in 1939 embraced 105 national and international unions having 33,744 local unions; 49 State Federations of Labor (including Puerto Rico); 806 City Federations of Labor; 4 Departments with 942 local departmental councils, and 1563 local trade and federal labor unions not affiliated with any national or international union but directly affiliated with the American Federation of Labor.

During the year charters were issued to two new international unions. These were the United Cement, Lime, and Gypsum Workers and the Seafarers International Union of North America. In addition two international unions which had left the American Federation of Labor to join the C.I.O. in 1935, returned to the fold. These were the United Textile Workers of America and the United Automobile Workers of America.

National Convention. Every issue of interest to organized labor was discussed, considered, and voted upon at the Convention.

Perhaps the most important problem taken up at the Convention was the question of labor unity. The Executive Council of the American Federation of Labor reported to the convention on the status of the peace negotiations with the C.I.O. The report declared the negotiations were terminated on April 5 by John L. Lewis of the C.I.O. and that he refused to continue them afterward. The Council concluded:

The facts set forth in this report are supported by the records which have been made. We must leave to the honest, sincere, and calm determination of the membership of the American Federation of Labor and of working men and women of the nation, the question as to who is responsible for the origination of the division within the ranks of labor and for its continuation in a most aggravated and destructive form.

Our committee still stands, clothed with authority to function, ready to resume negotiations when it is accorded an opportunity to do so. We have opened the door of the American Federation of Labor wide and completely. We have invited those who left the American Federation of Labor to return. We have urged them to come back home and settle differences within the family of labor in a sensible, honest, and fair way. In doing this we have been inspired by a genuine desire to establish here in America a solid, united labor movement through which the economic, social, and industrial interests of the workers of the nation can be fully and completely served.

President Franklin D. Roosevelt addressed a letter to the Convention urging the desirability of labor peace. A prompt reply was sent to the President informing him the American Federation of Labor's committee stood ready to resume negotiations whenever it was accorded an opportunity to do so. The Convention adopted a

resolution fully supporting the position of the Executive Council on this important issue.

The text of this declaration follows:

Your committee has had before it for consideration the letter addressed to this convention by the President of the United States, in which he urged the American Federation of Labor to again meet with representatives of the C.I.O. for the purpose of endeavoring to bring unity in the American trade union movement.

We also have the reply made to that communication by the President of the American Federation of Labor.

It was impossible for your committee to consider these two important communications without keeping in mind the detailed and historic record covering the efforts of the American Federation of Labor from the beginning to bring unity into effect.

The record presented to this convention by the Executive Council of the American Federation of Labor is exhaustive. It is a record of the facts, a record which indicates that from the time the C.I.O. was organized, continuous efforts were made by the American Federation of Labor to heal the breach.

The record indicates that before the President of the United States took official notice of the breach, a conference was held between duly appointed representatives of both organizations, and that the conference referred to was able to reach an agreement as to the principle involved in establishing unity, and the methods by which those principles could be applied.

The record further indicates that after the representatives of the C.I.O. had agreed on these principles and methods, that they were vetoed by the Chairman of the C.I.O., his action, in substance, being a repudiation of what his own representatives had agreed to.

The President of the United States appealed to the Houston Convention last year to take immediate steps to heal the breach which existed, a similar communication being sent to the representatives of the C.I.O.

The Convention by a unanimous vote complied with the President's request.

Although the American Federation of Labor placed itself publicly on record as favoring a conference with the representatives of the C.I.O., the response from that organization was the immediate calling of a conference in Pittsburgh, Pa., for the purpose of setting up a permanent established C.I.O. movement.

On Feb. 23, 1939, the President of the United States addressed a letter to the President of the American Federation of Labor and the Chairman of the C.I.O., calling attention to the necessity for unity in the American trade union movement, and urging that peace conferences between the two organizations be resumed.

As a result duly appointed representatives of both organizations did meet, their conferences adjourning so that the Chairman of the C.I.O. could give his attention to negotiations between the United Mine Workers of America and Coal Operators.

Conferences were postponed upon the request of the Chairman of the C.I.O. and with the definite understanding that they would be resumed, and that he would notify the representatives of the A. F. of L. immediately it would become possible for him to take part.

Although the committee of the A. F. of L. has held itself in readiness, it has failed to receive any further information as to when the conferences would take place.

On the other hand, public announcement was made in the interim by the Chairman of the C.I.O. that peace as such was secondary to the objectives of that organization.

Shortly after, in a communication addressed to officials of the C.I.O. reporting on the meeting of its Executive Board, he wrote:

"Among many problems discussed at length was the question of unity, and it has been clearly demonstrated that peace within the A. F. of L. is impossible except upon their terms and conditions. This would mean the stripping of many of our new unions and the abandonment of organizing the unorganized in industrial unions. This the C.I.O. will not do."

This communication was shortly followed by another public statement announcing the determination of the C.I.O. to invade the jurisdiction of the building trades, thus clearly indicating that instead of considering peace negotiations the C.I.O. was arbitrarily preparing for an intensified campaign of antagonism.

In full appreciation of the President's efforts to be helpful in bringing unity within the American trade union movement and appreciative of the efforts which he has made, we submit that the record from the time the C.I.O. was organized contains continuous efforts on the part of the American Federation of Labor to make unity a fact, that all of these efforts have been thwarted by the Chairman of the C.I.O.

We recognize that under the unhappy condition created by the division in the ranks of labor, it was appropriate that the President of the United States should address a similar appeal to both organizations.

Your committee calls attention to the fact that further appeals would be more fittingly directed to the C.I.O. for from the inception of the C.I.O. the American Federation of Labor has been ready and most willing to confer with representatives of the C.I.O. so that unity could be established, and your committee is of the conviction that this will continue to be the policy of the American Federation of Labor.

Your committee read with approval President Green's reply to the President of the United States and recommends that this communication receive the approval of the convention.

After the Convention the President of the United States made a personal plea to the President of the American Federation of Labor and to John L. Lewis as President of the C.I.O. for the resumption of peace negotiations. Mr. Green told the President at the White House that the American Federation of Labor committee was ready and willing to meet with representatives of the C.I.O. at any time to negotiate peace. It must be assumed that the leader of the C.I.O. refused the President's petition because no information that the C.I.O. representatives were willing to meet with those from the A. F. of L. had been received by the close of the year.

Another vital subject considered at the Convention was the formulation of labor's policy toward the war in Europe. The Convention adopted a strong stand for strict neutrality of the United States. At the same time the Convention demanded adequate labor representation on any governmental agency assigned to the task of drafting emergency mobilization plans. This declaration follows:

In such legislation as has come to our notice which has been prepared for enactment by Congress should a national war emergency arise, we are not aware of any provisions assuring labor of adequate representation.

We note with regret that in the administrative appointment of the War Resources Board no representative of the American trade union movement was included. Perchance that board was not created to consider and report upon facts and policies which directly included labor.

In all national emergencies the people as a whole are involved, and it should be mandatory that where a people are involved the principle of adequate representation should be observed. Labor because it is the most numerous; labor because it is one of the essential factors of defense; labor, which always must bear the greater burden, should be represented upon every national board, committee, commission or other federal body created having to deal with any phase of labor conditions during a period of national emergency. Failure to give labor such representation would be sufficient reason to cause the gravest doubts in labor's minds.

Other important actions by the Convention included:

1. It denounced the philosophies of Communism, Nazism, and Fascism and the aggressive, brutal policies of European dictators.

2. It reaffirmed the Federation's economic boycott against Nazi Germany and voted to impose a similar boycott on goods and services from Soviet Russia.

3. It called upon all affiliated unions to bar Communists from membership.

4. It adopted resolutions urging all affiliated unions to abjure any discrimination against workers because of race, color or creed.

5. It voted to support the Federation's amendments to the National Labor Relations Act, introduced at the 1939 session of Congress by Senator Walsh of Massachusetts and Representative Barden of North Carolina. This resolution placed particular emphasis on the amendment calling for a complete housecleaning of the members and staff of the National Labor Relations Board.

6. It reaffirmed the non-partisan political pol-

icy of the American Federation of Labor, calling for support of labor's friends and defeat of labor's enemies at the polls irrespective of party lines.

7. It recommended legislation broadening the scope of the Social Security laws and State legislation raising the standards of unemployment compensation.

8. It recommended the adoption of a national health insurance program as part of the Social Security system.

9. It called upon Congress to restore the prevailing wage principle in relief legislation.

Officers. Frank Morrison, Secretary-Treasurer of the American Federation of Labor, who had served in that capacity for 43 years, announced his retirement to the convention. He was elected Secretary-Treasurer emeritus for life at an annual salary of \$6000.

The convention elected the following officers of the American Federation of Labor for the year 1940: President, William Green; Secretary-Treasurer, George Meany; Vice-Presidents, William L. Hutcheson, T. A. Rickert, Matthew Woll, John Coefield, Arthur O. Wharton, Joseph N. Weber, G. M. Bugniazet, George M. Harrison, Daniel J. Tobin, Harry C. Bates, Edward J. Gainor, W. D. Mahon, Felix H. Knight, George E. Browne, Edward Florio.

WILLIAM GREEN.

AMERICAN LABOR PARTY. See COMMUNISM.

AMERICAN LAW INSTITUTE. See LAW.

AMERICAN LEGION, THE. An organization of World War veterans, chartered by Congress in 1919. Its purpose, stated in the preamble of its constitution, is "to uphold and defend the Constitution of the United States; to maintain law and order; to foster and perpetuate a 100 per cent Americanism; to preserve the memories and incidents of our association in the Great War; to inculcate a sense of individual obligation to the community, state, and nation; to combat the autocracy of both the classes and the masses; to make right the master of might; to promote peace and good will on earth; to safeguard and transmit to posterity the principles of justice, freedom, and democracy; to consecrate and sanctify our comradeship by our devotion to mutual helpfulness."

The Legion's 21st national convention was held in Chicago, Ill., Sept. 25 to 28, 1939. There were 1405 accredited delegates in attendance, representing every State, the District of Columbia, the departments of Alaska, France, Hawaii, Italy, Canada, Mexico, Panama, Puerto Rico, and the Philippine Islands outside the continental limits of the United States, and six outlying posts not attached to a department: China Post No. 1; Athens, Greece, Post No. 1; Tripolis, Greece, Post No. 2; Patras, Greece, Post No. 3; Brussels, Belgium, Post No. 1, and Guam Post No. 1. Approximately 250,000 Legionnaires, their families, and friends, attended the convention which reached its peak, Tuesday, September 26, with a 12-hour and 25-minute parade up Michigan Avenue and through Soldier Field by 100,000 marchers, 84 bands, 228 drum and bugle corps, 100 floats, and 50 engines and box cars, before at least 1,000,000 spectators, making this one of the greatest of all parades in Chicago history. Boston, Mass., was selected for the 22nd national convention, to be held Sept. 23 to 26, 1940.

The National Executive Committee at its meeting in Indianapolis, Nov. 23 and 24, 1939, designated the major national legislative program of The American Legion during 1940 to be: 1) government protection for World War widows and orphans; 2) an adequate national defense; 3) Universal Service in time of war; 4) effective veterans' preference in all government jobs; 5) tightening of immigration, naturalization, and deportation laws.

The major accomplishments of 1939 were in the fields of Americanism, child welfare, rehabilitation, legislation, and membership.

Americanism. Twenty-five Boys' States were conducted in 24 departments, with 10,959 boys enrolled. In these, boys are taught the practical theory of American self-government by having them organize a mythical 49th State. Participants go through the entire process of government from formation of political parties to elections, install their officers from governor to constables, enact and enforce their laws, and operate their boy State as adult citizens do in real life, to get accurate knowledge about their future citizenship obligations and responsibilities. Approximately 500,000 boys under 17 enrolled in the 13th annual Junior Baseball national tournament, forming approximately 25,000 teams which engaged in elimination play ending in a junior world's series. Omaha, Nebraska, Post 1, largest American Legion post, sponsored the winning team. There were 2938 Scout troops sponsored, making The American Legion the second largest individual troop sponsor. A national high school oratorical contest was held in which 24,000 students in 21 States participated. The winner was Fletcher Padget, Jr., 17, of Saluda, S. C. He was awarded a 4-year university scholarship worth \$4000, good at any school of his choice. A similar prize will be awarded during 1940 and already 32 departments have indicated they would participate. The Legion expended \$10,000 on a series of highway safety recordings for use over more than 300 radio stations in waging war on "sudden death." The Dies Congressional Committee to investigate un-American activities was given support (see under *Legislation*, below). The American Legion-sponsored American Education Week, Nov. 4 to 11, 1939, drew millions of parents to visit the nation's public schools. The theme for the 1940 observance of this week, November 10 to 16, will be "Education for the Common Defense."

Child Welfare. Continued success in the national child welfare programme was recorded during 1939 with the co-operation of the departments, posts, Auxiliary, Forty and Eight, Eight and Forty. Approximately 30,000 volunteers carried on the work. During the year incomplete reports showed expenditures, in part from The American Legion's own resources, and in part from outside sources, of the known total of \$3,757,865 in emergency financial aid to 442,489 needy children; \$1,968,632 came from various American Legion resources and those of its affiliated organizations, and \$1,789,232 represented local and government benefits obtained through Legion efforts. Most of this money went for food, clothing, and medical treatments for needy children. A portion of the Legion's \$5,000,000 endowment fund income was appropriated for child welfare relief in families of World War veterans. Administrative expenses were paid from dues of members.

Rehabilitation. During the fiscal year ending June 30, 1939, the National Rehabilitation Com-

mittee, without cost to the beneficiaries, obtained for World War veterans and their dependents, the total of \$3,311,475 in recoveries for adjusted compensation, emergency officers' retirement pay, government insurance, disability, death, burials, and other benefits. During the same period the Committee received 152,987 letters from World War veterans in connection with claims of all kinds. The Committee reported there was a grand total of 85 hospital facilities in operation under the Veterans Administration and that as of June 30, 1939, there were 61,780 World War veterans receiving treatments there. The Committee presented an estimate that for the calendar year of 1940 the total of surviving World War veterans is 4,041,000 of whom 11,068 will be between 35 and 39 years of age; 1,304,669 between 40 and 44; 1,823,976 between 45 and 49; 753,698 between 50 and 54; 86,584 between 55 and 59; 39,296 between 60 and 64; 14,287 between 65 and 69; 5,501 between 70 and 74; 1,598 between 75 and 79; 303 between 80 and 84; 36 between 85 and 89; and 4 between 90 and 94.

Legislation. Legislation obtained increased government compensation for World War widows and orphans, and reduced eligibility requirements for same. Signal progress was also made toward the ultimate objective of adequate national defense. Progress towards tightening immigration, naturalization, deportation laws was achieved. Extension of the Dies Congressional Committee investigation for another year, and appropriation of \$100,000 for its expenditures were approved by House of Representatives February 3 by a vote of 344 to 35.

Membership. For the third consecutive year it was the second best membership year in the history of The American Legion and of its four affiliated organizations. On December 31 there were 1,032,597 members in The American Legion. This was an increase over 1938 of 60,982. The number of posts was 11,564, a new peak. The American Legion Auxiliary for the fourth consecutive year established a high mark in membership, enrolling 246,300, distributed among 9100 units. The Sons of The American Legion for the seventh consecutive year increased its numerical enrollment with 72,346 members and 3242 squadrons. The Forty and Eight membership also broke all former records again with 40,794 in 675 voitures. The Eight and Forty also reported a new high enrollment of 7018 in 308 salons.

The National Officers elected for 1939-40 were: National Commander, Raymond J. Kelly of Detroit, Mich.; Vice Commanders, Leo E. Ray, Gosham, N. Hamp.; Charles Q. Kelley, Little Rock, Ark.; Matthew J. Murphy, Chicago, Ill.; James B. Fitzgerald, Chevy Chase, Md., and H. Elwyn Davis, Pueblo, Col.; National Chaplain, the Rev. Father Patrick N. McDermott, Atlantic, Ia.; National Historian, Thomas M. Owen, Jr., Washington, D. C.; National Adjutant, Frank E. Samuel, Indianapolis, Ind.; National Treasurer, John R. Ruddick, Indianapolis, Ind., and National Judge Advocate, Ralph B. Gregg, Indianapolis, Ind. The last four were elected by the National Executive Committee, at National Headquarters, 777 North Meridian Street, Indianapolis, Ind., Nov. 23, 1939. Legislative and rehabilitation offices of The American Legion were maintained in the Legion-owned building at 1608 K Street, N. W., Washington, D. C. Editorial and advertising offices of *The American Legion Magazine* were at 15 West 48th Street, New York City.

AMERICAN LITERATURE. See LITERATURE, ENGLISH AND AMERICAN.

AMERICAN SOCIALIST PARTY. See SOCIALISM.

AMERICAN YOUTH CONGRESS. See DEMOCRACY.

AMHERST COLLEGE. An institution for the higher education of men in Amherst, Mass., founded in 1821. For the autumn term of 1939 approximately 850 students were enrolled. The active faculty numbered 83, with 17 assistants. The productive assets of the college amounted to \$11,954,000; the income for the year was \$1,093,000. The library contained 200,000 volumes. President, Stanley King, LL.D.

ANDERSON, MARIAN. See NEGROES.

ANDORRA, ăn-dôr'ă. A small republic in the Pyrénées between France and Spain, under the joint suzerainty of the President of France and the Spanish Bishop of Urgel. Area, 191 square miles; population, 5231. Capital town, Andorra. The language spoken is Catalan. Sheep rearing is the main occupation of the people. There is a governing body called the council-general consisting of 24 members (12 elected every 2 years) elected for 4 years by male citizens of 25 years of age or older. The council-general nominates the First Syndic (President) and Second Syndic (Vice President).

ANGLO-EGYPTIAN SUDAN. A British-Egyptian condominium in northeast Africa. Area, 969,600 square miles; population (estimated), 6,186,847 of whom 54,473 were non-natives. Chief towns: Khartoum, the capital (46,676 inhabitants), Omdurman (110,959), Khartoum North and Rural District (110,720), Wadi Halfa, Merowé, El Damer, Athara, Port Sudan, and Suakin.

Production and Trade. The principal products (with 1938-39 outputs in metric tons) are ginned cotton (\$5,500), gum arabic (chief source of the world's supply), sesamum (36,600), groundnuts (6500), senna, cottonseed (100,800), dates, mahogany, hides and skins, chillies, ghee, dom nuts, salt, ivory, shea seeds, and gold. Durra (great millet)—the staple food of the Sudanese and exported as feed for livestock, and dukhn (bulrush millet) are the main crops. In 1938, imports were valued at £E6,283,719 (cotton piece goods £E1,144,983, refined sugar £E637,927); exports, £E5,490,362 (cotton £E3,427,221, gum arabic £630,335). Great Britain supplied 26.2 per cent of the imports, Egypt 2.3 per cent, Japan 17.5 per cent, and the U.S.A. 2.3 per cent. Of the exports Great Britain took 47.1 per cent, Egypt 13.1 per cent, and the U.S.A. 3.5 per cent. The £E (Egyptian pound) had an average exchange value (in U.S. currency) of \$5.0692 in 1937 and \$5.0130 in 1938.

Communications. Railway lines open for traffic on Jan. 1, 1938 totaled 2015 miles of 3 ft. 6 in. gauge. There is an all-year motor transport service between Juba and Nimule (on the Uganda border) and between Juba and Aba (Belgian Congo). Another motor transport operates, during the dry season, between Juba to Kampala (Uganda), and to Nairobi (Kenya). Over 3000 miles of the navigable arms of the Nile and its tributaries are served by a fleet of government steamers. Caravan routes traverse the country. Highways, in 1938, extended 14,240 miles. An air service connects Nigeria and the Gold Coast with the British Empire route to South Africa at Khartoum. The country had (in 1938) 23 wireless stations and 5708 miles of telephone and telegraph routes.

Government. In the budget for 1938, revenue was estimated at £E4,672,500 and expenditure at £E4,478,401. The country is administered (under the Anglo-Egyptian Convention of 1899; reaffirmed by the Anglo-Egyptian Treaty of 1936) by a governor-general (appointed by Egypt with the assent of Great Britain) aided by a governor-general's council. All ordinances, laws, and regulations are made by the governor-general in council. Flags of each country (Great Britain and Egypt) are used together. There is a governor for each of the eight provinces into which the territory is divided. Governor-General, Sir G. S. Symes whose term, due to expire Jan. 1, 1940, was extended to June 1, 1940, because of the war.

History. During 1939 the Egyptian government approved an agreement for the repayment of the Anglo-Egyptian Sudan's £6,000,000 debt to Egypt; payments are to start after a period of 10 years at the rate of £100,000 a year for 60 years. It was announced in June that water had been discovered in wells under the mountain east of the Nazir's village in the region of Ayal Bakheit, Kordofan.

ANGLO-IRANIAN OIL CO. See IRAN under *History*.

ANGOLA, ăng-gō'la. A colony in west central Africa, belonging to Portugal. Area, 487,788 square miles; population (1936), 3,484,300 including 59,000 Europeans and 21,800 half castes. Chief towns: Nova Lisboa (Huambo), the capital; Loanda, Benguela, Mossamedes, Lobita, and Malange. In 1938 there were 70 primary, 3 secondary, and 106 professional schools.

Production and Trade. The chief crops (with outputs for 1937-38, in metric tons) are maize (260,500), sugar (32,500), coffee (14,300), wheat (10,600), palm oil (3000), palm kernels (2600). Cacao, sisal, cotton, and tobacco are other crops. Wax is an important product. There are rich deposits of diamonds. Copper and lignite exist but are not mined. Salt has been found. In 1938 (values in old U.S.A. gold dollars), imports totaled \$5,000,000 (textiles, foodstuffs, and coal were the chief items); exports, \$7,900,000 (diamonds, maize, and coffee were the main exports).

Communications. In 1938, there were 40,205 miles of roads (including 17,215 miles of secondary roads), 2080 miles of railways open for traffic, 5790 miles of telegraph lines, 259 miles of telephone lines, and 19 wireless stations. The greater part of the ocean-carrying trade between Angola and Europe is in the hands of a Portuguese company.

Government. Budget: (1940) 212,003,452 angolares; (1939) 255,990,232 angolares. For 1938 revenue totaled 197,534,634 angolares; expenditure, 169,841,749 angolares (in 1937, 217,158,596 and 182,854,650, respectively). The angolar averaged \$0.0443 for 1938 and \$0.0448 for 1937. A governor-general heads the administration. The colony is divided into 5 provinces and 14 administrative districts (decree of May, 1934). Governor-General, Dr. Márquez Mano (appointed Feb. 10, 1939).

ANSLEY, CLARKE FISHER. An American editor, died in Solesbury, Pa., Feb. 14, 1939. Born in Swedona, Ill., Dec. 29, 1869, he received the de-

gree of A.B. at the University of Nebraska in 1890 (Litt.D., 1917) and studied abroad during 1892-94. Upon his return he joined the staff of his alma mater, being successively instructor in English (1894-96), assistant professor (1897-98), and professor (1898-99), and then transferred to the State University of Iowa as professor of English and head of the department. Also, he served as dean of the College of Fine Arts (1911-15). He retired in 1917.

In 1921 he emerged from his retirement to accept the editorship of *The New State*, a labor paper published in Lincoln, Neb., and in the following year he became director of the New School for Social Research in New York. He gave up teaching in 1924 to do editorial work and, until 1927 when he became editor-in-chief of the Columbia University Press, he did such work for the Macmillan Co., the *Encyclopædia Britannica*, and the G. & C. Merriam Co. The *Columbia Encyclopædia*, published by the University Press under his editorship in 1935, after eight years' work, was the crowning achievement of his career. He also edited the *Supplement* to this volume which appeared in 1938. Many other important works were published by the Press under his editorial direction.

ANTARCTIC EXPLORATION. See POLAR RESEARCH.

ANTI-AIRCRAFT. See MILITARY PROGRESS.

ANTIGUA. See LEEWARD ISLANDS, BRITISH.

ANTI-LYNCHING BILL. See LYNCHING.

ANTIMONY. Listed as one of the "strategic" metals by the Army and Navy, antimony is not largely produced in the United States. Domestic consumption in recent years has ranged from 10 to 15 times domestic production, the difference being made up by imports. One smelter at Laredo, Texas, usually draws its supply of ore from Mexico which, together with South America, furnishes the great bulk of ore imports. China is the largest producing country in the world, Mexico second, and Bolivia third.

The trend of antimony prices was upward in 1939, reversing the record of 1938. The New York price for ordinary grades rose from an average of 11.67¢ per lb. in January to 14¢ in December. The average for 1939 was 12.36¢ per lb., only fractionally different from the average price for 1938, when the trend of prices throughout the year was downward.

H. C. PARMELEE.

ANTIOCH COLLEGE. A nonsectarian, co-educational, liberal arts college in Yellow Springs, Ohio, operated on the co-operative plan of alternating work and study periods. The college was founded in 1853 with Horace Mann as its first president, and reorganized in 1920 by Arthur E. Morgan. The number of students enrolled for the autumn term of 1939 was 729, of whom 462 were men and 265 were women. The faculty numbered 100. For the year 1938-39 the productive funds of the institution amounted to \$305,292.79, and the operating income, including research, was \$583,010.30. The library, to which a substantial addition was made during the year with a Carnegie Corporation grant, contains 54,000 volumes. Advances for the year include a new Student Counseling setup centering all counseling work under the Dean of Students; a new work-training programme for freshmen; and a new housing unit for senior women. President A. D. Henderson, LL.B., M.B.A.

ANTI-SALOON LEAGUE OF AMERICA. A federation of church and temperance organizations in the United States whose object is the extermination of the beverage liquor traffic. It was established in 1895 by a coalition of the Anti-Saloon Leagues of four states and the District of Columbia. In 1937, to meet the changed situation resulting from repeal of national prohibition, the organization's constitution was revised to place the major emphasis on state work and to enlarge the activities of the State Leagues in the states and local communities. At the end of 1939 it embraced 40 state or territorial Leagues, held membership in the National Temperance and Prohibition Council, and was affiliated with the World League Against Alcoholism. (q.v.)

During 1939 the organization's chief exertions have been directed toward the development of adequate scientific temperance education; legislative restrictions that will subordinate revenue to social considerations by measures tending to insure that the demand for alcoholic beverages shall be a progressively diminishing one; to prevent the issuance of licenses in rural and inadequately policed territory or in excessive numbers; and to secure the right of the people under local option laws to express themselves upon legislative measures relating to the liquor traffic.

The year was marked by a considerable increase in the number of no-license areas under local option law, also by a favorable report by the Senate Committee on Interstate Commerce of the 76th Congress on a bill to prohibit radio advertising of alcoholic beverages.

The officers in 1939 were: President, Bishop Ralph S. Cushman, St. Paul, Minn.; vice president, Andrew Wilson, Washington, D. C.; treasurer, Charles E. Coleman, Chicago, Ill.; secretary, George W. Crabbe, Baltimore, Md. The legal department and national headquarters are located at 131 B Street, S.E., Washington, D. C.

AQUEDUCTS. On Jan. 7, 1939, the first water was turned into the great aqueduct which will convey water from the Parker Dam on the Colorado River 242 miles to the Metropolitan District of Southern California. On that date the intake pumping plant at the dam began lifting the river water 291 ft. to the entrance of the 2-mile tunnel through which it flows to Gene Basin reservoir. This aqueduct has 108 miles of tunnel and the last bore to be completed was the difficult 13-mile San Jacinto section on which the last cubic yard of concrete was poured October 14. By November 9 the first flow reached the main terminal Cajalco reservoir after its long journey from the Colorado and after having been lifted a total of 1617 ft. at the five pumping plants along the line. While it will be another year before the distribution system can be completed and water will reach the 13 cities of the district, the major construction features of one of the greatest hydraulic engineering works ever attempted by man have thus been brought to a successful completion.

In the meantime remarkable progress has been made on the new Catskill aqueduct for New York City which will both afford an additional supply from the western Catskill mountains (upper Delaware Drainage) and also bring into the high level

supply of certain of the existing reservoirs of the upper Croton watershed. All of this 85-mile aqueduct will be in deep tunnel. The sinking of some 20 or more shafts marked the first stage of this project. During the past year tunneling operations have gone forward between these shafts. Early in November the first of these tunneling operations was "holed through." Twenty-four more of these "meetings of the excavators" deep underground are still to come. These include the deep section between shafts 5A and 6 where the aqueduct passed under the Hudson River at a depth of 600 ft. below sea level. In view of the present depleted condition of the existing New York reservoirs caused by the abnormally low rainfall of the past year, the need for additional supply has become more obvious.

Another major project of this type is the construction of the new aqueduct to bring the water of the Swift and Ware Rivers into the Metropolitan district of Boston. The famous Quabbin reservoir is now being connected with the older system of the Wachusett supply. Steady progress on this work (noted in previous YEAR BOOKS) has been made during the year.

Projects of the magnitude of these works must be regarded as exceptional, and, while there are other great cities or metropolitan districts which will undertake such great works (the situation in Philadelphia, for example, is very critical), the bulk of American waterworks activities is on a much smaller scale. Data on the many smaller pipe lines and similar works, which make up the majority of such operations, are seldom given space in the technical press. Yet the pipe-line problem is one which the engineer constantly has to meet, and trends and changes in such construction are thus worthy of note.

The construction of a 31-mile steel and reinforced concrete pipe line to bring water from Lake Michigan to the City of Grand Rapids, Mich., shows an interesting development in such pipe-line construction. A welded water-tight steel shell was used which was lined with concrete inside and was incased in a heavily reinforced concrete exterior covering. The pipe size varied from 46 to 20 inches in diameter. Reinforced concrete pipe in 12 ft. lengths and of 84 in. interior diameter was also used on the Quabbin aqueduct. Similar pipe has, of course, been in use for many years and several notable installations in sewer and sewer outfall constructions were undertaken during the year. These examples indicate an increasing use of concrete pipe for lines of the larger diameter.

The deterioration in carrying capacity of steel and cast iron pipes, due to the roughening of the interior surface by corrosion, has also led to important improvements in lining such pipes with smooth, non-corrosive coatings.

JAMES K. FINCH.

ARABIA. A large peninsula in southwestern Asia. Area, 1,000,000 square miles; population, said to be 10,000,000. For the various divisions of Arabia see below. Arab countries outside the Arabian peninsula are presented in the separate articles on EGYPT, IRAQ, PALESTINE, SYRIA AND LEBANON, and TRANS-JORDAN.

Aden, a'den; a'den. A British crown colony on the southern coast of Arabia, about 100 miles east of the Red Sea. It consists of (a) the Aden peninsula—the seaward end being an extinct volcano in the crater of which lies the ancient town of

Aden, the suburb known as Tawahi, the area leased to the Royal Air Force and known as Steamer Point, and the village of Maala; (b) the isthmus called Khormaksar; (c) the land running to the north and to the west around the harbor to another rocky peninsula called Little Aden. The villages—Sheikh Othman, Hiswa, Imad, and Fakum are in this region; (d) the island of Perim (5 sq. mi.) in the strait of Bab el Mandeb. Total area, 80 square miles; total population (1931 census), 48,358 including 2346 on Perim but excluding the military forces. The colony contains an important naval base and fortified seaport. Aden also is the capital of the Aden Protectorate (see below).

Aden is a free port and a commercial and transshipment center for the Arabian peninsula. During recent years it has become an important oil-fueling port. The colony produces salt, soap, dhows (Arab ships), cigarettes, and cured fish. There are a number of establishments in which cloth is dyed for export. Cattle, sheep, and goats are imported for home consumption. In the year ended Dec. 31, 1937 (excluding transshipment), total imports were valued at Rs82,286,948; total exports, Rs47,223,316 (rupee averaged \$0.3733 for 1937; \$0.3659 for 1938). From Apr. 1, 1937 to Mar. 31, 1938, ocean shipping aggregating 8,878,040 tons entered the port.

For the year ended Mar. 31, 1938, revenue totaled Rs2,252,596; expenditure, Rs1,696,977. The colony is administered by a governor, assisted by an executive council of 5 members (2 ex officio and 3 appointed by the King). Aden has no legislative council. There was an appropriation in the British defense estimates for strengthening the naval base at Aden during 1939. Governor and Commander-in-Chief, Lt.-Col. Sir Bernard Reilly (assumed office Apr. 1, 1937).

Aden Protectorate. The large area in southern Arabia under British protection, extending from the Red Sea to the sultanate of Oman. It is bounded on the north by Yemen and Saudi Arabia. The eastern areas are known collectively as the Hadhramaut (Hadhramaut) made up to a large extent of fertile valleys. Included in the protectorate is the island of Socotra (1400 sq. mi.; pop. 12,000) in the Arabian Sea. Total area, about 112,000 square miles; population, estimated to be 600,000. The mainland consists of a large number of tribal areas, the chiefs of which have treaty relations with Great Britain. There is no direct administration of the protectorate but control rests with the governor of Aden who acts on behalf of the British Colonial Office in London. The governor is assisted by a political secretary and a number of political officers, the senior one being resident adviser to the Sultan of Mukalla who represents the Qa'aiti dynasty to which the larger part of the Hadhramaut owes allegiance. A number of inland towns and villages are ruled by a rival dynasty, the Kathiri.

Bahrein (bā-rān') Islands. A group of islands in the Persian Gulf, 20 miles from the coast of Saudi Arabia. Bahrein, Muharraq, Sitra, and Nebi Saleh are the main islands. Area, 213 square miles; population, 120,000. Chief towns: Manama (on Bahrein), the capital, had 25,000 inhabitants; Muharraq, 25,000. The principal industries are pearl fishing, boatbuilding, manufacture of sailcloth and reed mats, breeding of white donkeys, and crude oil production (1,139,000 metric tons in 1938). In 1937-38, imports were valued at Rs20,920,260; exports (excluding oil), Rs12,042,910 (rupee av-

eraged \$0.3733 for 1937; \$0.3659 for 1938). The islands are governed by a ruling sheik, and have had treaty relations since 1820 with the government of India (which is represented by a political agent). Ruling Sheik, Sir Hamad bin Isa al Khalifa (acceded Dec. 9, 1932).

Kuwait, kōō-wit'. An Arab state adjacent to southeastern Iraq, under British protection. Area, 1930 square miles; population (estimated), 50,000, not counting an indeterminate number of Bedouins. Capital, Kuwait. In 1934-35, imports were valued at £277,034; exports, £80,154 (pearls, horses, and wool were the main exports). There are many shipyards where dhows are built. During 1938 oil was discovered south of the town of Kuwait. The country has treaty relations with the government of India, which is represented by a political agent. Ruling Sheik, Sir Ahmed ibn Jabir al Subah (acceded Feb. 23, 1921).

Oman, ō-mān'. An independent state in southeastern Arabia. Gwadar, a port on the coast of Baluchistan in British India, belongs to Oman. Area, 82,000 square miles; population (estimated), 500,000, mostly Arabs, but there is a strong infusion of Negro blood along the coast. Chief towns: Muscat, 4500 inhabitants; Matrah, 8500. The principal products consist of dates, pomegranates, limes, and dried fish. In 1937-38, imports were valued at Rs4,167,125; exports, Rs3,299,015 (rupee averaged \$0.3659 for 1938; \$0.3733 for 1937). Muscat is the only port of call for steamers and 81 ships of 117,563 tons entered and cleared during 1937-38. The Sultan's revenue varies between Rs600,000 and Rs700,000 yearly. Sultan, Saiyid Said bin Taimur (succeeded Feb. 10, 1932).

Oman, TRUCIAL. The six Arab states along the south coast of the Persian Gulf, having treaty relations with the government of India. Area, 6000 square miles; population, 80,000 excluding 8000 nomads. Chief capital, Abu Dhabi. The export of pearls is the principal trade of the coast ports. A British political resident at Bushire in the Persian Gulf is the recognized arbiter and adviser of Trucial Oman. The states (with name of ruler and the year he succeeded in parentheses) are Shargah (Muhammad Sultan bin Saqar, 1924), Ras al Khaimah (Sultan bin Salim, 1919), Umm ul Qawain (Ahmad bin Rashid, 1929), Ajam (Rashid bin Humaid, 1928), Debai (Said bin Maktum, 1912), Abu Dhabi (Shakput bin Sultan, 1928).

Qatar, kā'tar. The peninsula extending into the Persian Gulf from the western part of Trucial Oman. Area, 8500 square miles; population, 25,000. Capital, El Beda (Doha). Treaty relations with Great Britain are regulated by the treaty of Nov. 3, 1916. Sheik, Abdullah ibn Jasim eth Thani (succeeded 1913).

Saudi (sā-ōō'dē) Arabia. An Arab kingdom occupying the northern and central part of Arabia, formerly known as the Kingdom of Hejaz and Nejd and its dependencies. During 1932 it was announced that a single constitution would be provided for the whole country but this has not yet been accomplished and there still exists two systems of government—one for Hejaz and one for Nejd. Ruler, King Abdul Aziz ibn Abdur Rahman al Faisal al Saud.

Nejd extends over some 800,000 square miles and includes the Nafud and Dahna deserts. Population (estimated), 3,000,000. The chief towns are Riyadh, the capital, 30,000 inhabitants; Hufuf, 30,000; Mubarratz, Shaqra; Anaiza; Buraida; Hail; Jauf; Sakaka; Hanta. Dates, wheat, barley,

fruit, hides, wool, clarified butter, and Arab cloaks are produced. Livestock raising (camels, horses, donkeys, and sheep) is an important occupation. Piece goods, sugar, coffee, tea, and rice are the main imports. The export trade is small. Nejd and its dependencies are governed by the King, his administration being of a patriarchal nature without ministers of state. The King's eldest son (Emir Saud) acts as Viceroy of Nejd where he normally resides.

Hejaz occupies the western part of Arabia from Trans-Jordan to Asir. Area, said to be 150,000 square miles; population, roughly estimated to be 150,000. The principal towns are Mecca, the capital and holy city of Islam, with 80,000 inhabitants; Jidda, the seaport for Mecca, 30,000; Medina, the site of Mohammed's tomb, 20,000; and Yenbo (Yanbu). Dates, butter, honey, fruit, wool, and hides are the important products. The annual pilgrimage of Moslems from abroad to Mecca and Medina is the main source of income. Hejaz is still governed under the constitution of Aug. 26, 1926, and later amendments. There is a council of ministers presided over by the King's second son, Emir Faisal, who is minister of foreign affairs. During the absence of the King, the Emir Faisal acts as Viceroy.

Asir, a province between Hejaz and the independent state of Yemen, was incorporated in the kingdom of Saudi Arabia during 1933. It has an area of 14,000 square miles and a population of 1,000,000. Capital, Sabiya, 20,000 inhabitants.

Yemen, yem'en. An independent kingdom in southwestern Arabia, between Saudi Arabia and the Aden Protectorate. Area, 75,000 square miles; population, 3,500,000. Chief towns: San'a (capital), 25,000 inhabitants; Hodeida (chief port), 40,000; Taizz; Ibb; Yerim; Dhamar; Mocha; Loheiya. Yemen's principal products consist of coffee, barley, wheat, millet, and hides. The King's eldest son (Prince Seif al Islam Ahmad) is commander-in-chief of the armed forces. Ruler, King Yahya Muhammed Hamid ed Din.

History. Of outstanding importance was the rapid development of rich new oilfields in Saudi Arabia on the eastern seaboard of the Arabian Peninsula. The Damaan Dome in the California Arabian Standard Oil Company's concession covering 240,000 square miles alone produced an average of 950 tons daily during the first half of 1939. This oil was delivered via a new 43-mile 10-inch pipeline to the deep-water port of Ras Tanura opened in 1939 on the Persian Gulf about 40 miles northwest of Bahrain. From there it was sent by tankers to the Bahrain refineries.

In July, 1939, the California Arabian Standard Oil Company obtained from King Ibn Saud exclusive rights to exploit oil deposits within an additional 89,041 square miles of adjacent territory. To obtain the concession, the company gave the King \$1,500,000 in gold coin and agreed to pay \$750,000 annually while exploration was in process, to pay royalties on the basis of actual production, and to construct a refinery in Saudi Arabia capable of supplying the country's needs. The King granted the concession to the American company despite far more lucrative offers made by Italian, German, and Japanese interests. He suspected Italy, Germany, and Japan of having political designs upon his kingdom and its petroleum wealth. Offers made by British and French oil interests were said to have been turned down for similar reasons. Ibn Saud showed his interest in the new oil developments by visiting the fields

in May. He was later the guest of the Sheikh of the British-controlled Bahrain Islands.

The British, Italians, and Germans continued their political activities in various parts of the Arabian Peninsula. The British signed a new treaty of commerce and friendship with the Sultan of Oman, replacing the treaty of 1891 which expired on Feb. 11, 1939. This continued the understanding under which Oman's deep-water port of Muscat, controlling the entrance to the Persian Gulf, would be placed at the disposal of the British navy in case of disturbances in that area. The Italian Government continued to cultivate the Imam of Yemen. It was reported from Aden in August that an Italian steamer had landed coastal and anti-aircraft guns and ammunition for fortification of the town of Sheikh Said, near the narrow southern entrance to the Red Sea.

German agents were also reported as trying to stir up the Arab states and individual tribes against the British, taking advantage of Arab opposition to Britain's policy in Palestine (q.v.). The failure of this propaganda became evident after the outbreak of the European war, in which Arab sympathies were reported to be overwhelmingly on the side of Britain and France. The Nazi-Soviet pacts in particular served to undermine German prestige among the Arabs, who were strongly anti-Communist.

In January the Saudi Arabian Government published a letter written by King Ibn Saud to President Roosevelt the previous month denouncing as a "horrible crime" the "Jewish attempt to crush the Arabs of Palestine." The King declared that the American people had been misled by Zionist propaganda and viewed the Palestine question "solely from the point of view of the Zionist Jews."

See SYRIA AND LEBANON under *History*.

ARBITRATION, LABOR. See LABOR CONDITIONS; NATIONAL LABOR RELATIONS BOARD; UNITED STATES CONCILIATION SERVICE; for *Maritime Labor Board*, see SHIPPING.

ARCHAEOLOGICAL INSTITUTE OF AMERICA. A society for the promotion of archaeological investigation and research, founded in Boston in 1879 and incorporated by Act of Congress in 1906. It has accomplished its purpose in part through the American School of Classical Studies at Athens, the School of Classical Studies of the American Academy in Rome, the American Schools of Oriental Research in Jerusalem and Baghdad, the School of American Research in Santa Fe, N. M., The American School of Prehistoric Research at Peabody Museum, Yale University, and the Committee on Medieval and Renaissance Studies. Further work of the Institute is the support of lecture programs before its local chapters and aid given to excavations. In 1939 it had 34 societies or chapters with a total membership of about 1610. The official organ is the *American Journal of Archaeology*, a quarterly. The officers for 1939 are: President, William B. Dinsmoor, Columbia University; general secretary, H. T. Westbrook, Columbia University; treasurer, Seth T. Gano, Boston, Mass.; and recorder, Stephen B. Luce, Boston, Mass.

ARCHAEOLOGY. As might be expected the turmoil in Europe has caused an almost complete cessation of activity in the field of archaeology since the beginning of September. Even during the summer suspicion of what might occur

virtually put an end to exploration. Up to that time digging was carried on at many of the old, familiar sites while several new digs have brought to light many interesting facts.

At Hermopolis in Egypt work has been continued on the site of the "ibis" sanctuary. This year the efforts of the Egyptian University were concentrated on clearing gallery "C." The two main corridors which run from north to south, turning from the east to the west, have been opened up. The gallery has the usual entrance, which consists of a small sloping opening and a descending flight of stairs that lead to the lower level. This part had not been disturbed since about 600 B.C. Exploration of this underground corridor revealed that it had been filled with jars and that on both sides niches had been cut in the walls. In these jars and niches were found mummies of cynocephali in sarcophagi of wood and stone. Between the niches the doors were filled in with irregular pieces of stone. The doorways themselves opened into rooms filled from floor to ceiling with jars that contained the mummies of ibises, and the mouths of these jars had been sealed with linen soaked in plaster. The clearing of the floor of the first corridor revealed in the middle a group of small stone sarcophagi in the form of ibises. They were arranged in groups of eight which led from east to west. It would seem that the number "eight" refers to the city of Hermopolis, inasmuch as in Egyptian the name of the city is spelled with eight strokes. The clearing of the archives office revealed a large papyrus placed in a jar. It concerns itself with judicial matters; a corpus of law dealing with the relationship of landlord and tenant and with the laws of inheritance.

In the archaic cemetery at Sakkara excavations have brought to light an important tomb from which were recovered a complete set, 63 in all, of copper swords and knives, varying in length from nine inches to two feet. Most of them were supplied with wooden handles. In addition to these weapons were many copper vessels of unique design, and also some bodkins and a set of chisels. The latter are particularly interesting, as models only have previously come to light. Inscriptions reveal this to be the tomb of King Zer, the third ruler of the first dynasty.

Also at Sakkara the clearing of the great court of the pyramid of King Zoser brought to light three small statuettes of granite, found at the foot of the pyramid where robbers had abandoned them. They date in the fifth dynasty. Two form a group of standing figures which represent the same person, the other, a seated figure thirteen inches in height carries the name of Her-en-Kaw, who was director of the scribes of the textile fabrics. On the standing group were traces of color on the head, nails, and face.

Further work has been done on the site of Lachish in Palestine. Here have been found tombs of the Middle Bronze Age as well as caves which were occupied as dwellings as early as the Early Bronze Age. One of these caves proved to have been a pottery of the Late Bronze Age, in which were found many unlaked fragments of pottery together with lumps of clay prepared for use. Not the least interesting of the finds were two stone pivots which had belonged to potter's wheels. Near the entrance to the cave was the potter's stone seat let into the bedrock. In front of it a circular depression may have been the position of his wheel. Many tools were re-

covered, also lumps of ochre and pebbles and shells which had been employed to polish the wares. In an adjoining cave, accessible by a circular staircase, the potter kept his finished wares.

Excavations just inside the city gate of Lachish have supplied information about the invasions of Nebuchadnezzar. It can now be made out that twice the city suffered from fire. The earlier conflagration was in the time of Jehoia-chim, the second at the close of the reign of Zedekiah. A large space has been cleared to the east of the palace which has freed the whole length of the building. Beneath the brickwork which had fallen from the upper part of the wall and which showed traces of burning, was located the lower portion of the main entrance staircase. This had been built over an earlier staircase of which only two steps remain. Someone had scribbled on the face of one of these steps the first five letters of the Hebrew-Phoenician alphabet. This is the first time anyone has found these letters written in the conventional order. The palace seems to have been destroyed at the time of the first disaster to the city. In one of its rooms workmen found a fragment of a tablet containing part of a letter, the opening words of which were, "In the ninth year." It was found in some ashes on the floor of the room, and this may indicate that the "ninth year" may refer to the time of Zedekiah, inasmuch as it was in the ninth year of the rule of that king that Nebuchadnezzar sacked Jerusalem for the second time.

Of particular interest is the work done this past year by the joint expedition of Brown and Harvard Universities on the site of Van in Northern Asia Minor. The efforts of the expedition were directed toward the exploration of the hill of Van Kaleb where evidence has turned up which shows that this site was occupied as early as the fourteenth century B.C. by a people who came to be the chief rivals of the Assyrians in this part of the world. The power of this people seems to have come to an end when the Medes destroyed the place about 600 B.C. The finding of Vannic and Assyrian inscriptions on the walls of the palace, which was discovered on the site, should throw considerable light on the history of this place and its inhabitants. On the north side of the hill of Van Kaleb a most interesting rock terrace, about 40 by 100 feet, was uncovered on which a ceremonial platform stood. Here also was found a drain which suggests that it was connected with some sacrificial rites. Not far away, at the mound known as Tilke Tepe, the expedition found some beautifully executed pottery which speaks for the excellence of early Vannic workmanship. Many skeletons were found, of which some were placed in a contracted position, while others showed signs of burning.

At Kunduz, twenty-five miles south of the Oxus, in Afghanistan, excavations at the depth of twelve feet brought to light column bases of the Hellenistic age. These belonged possibly to a temple which is the first Greek structure found in Central Asia.

This year marked the ninth campaign on the site of the Athenian Agora, with the major efforts concentrated on the area on the Areopagus extending west to the modern street which runs from the Acropolis to the Thesum. Here the accumulated earth was found to be shallow. In clearing the surface of the rock the workmen came across a chamber which had been hewn into

the bedrock. It was found to be filled with a mass of splintered stone, deposited there at a somewhat later date when the burial was changed. A clue to the date of the tomb is given by the fact that the rockcut entrance passage contained only fragments of Mycenaean pottery. Inside the chamber a bench had been cut along each side of the room at a height of two and one half feet from the floor. In place on the north end of the eastern bench were found six vases and a cylindrical box of ivory. The box was intact. To the east of the door against the north wall two large vases stood on the floor, and beside them a long-handled copper ladle. In the center of the chamber on the floor were ashes and charcoal. The grave itself had been cut to the depth of four feet in the floor of the chamber. The slab of stone which originally covered it had at some time in the past been pried at an angle to one side. The grave itself was empty, but on the floor were a number of small objects, including a bronze mirror, a small ivory box, ivory pins, and, on the floor to the north of the grave, three piles of golden objects. The six vases found on the east bench belong to the first half of the fourteenth century B.C. The ivory toilet box found near these vases is beautifully carved with griffins attacking stags. The various objects prove that the tomb was that of a princess.

Work on the slope of the Acropolis near the *klepsydra* uncovered a boundary stone of the *Ceramicus* at the northwest corner of the excavations.

At Delphi one of the most interesting finds has been made under the Sacred Way of the temple of Apollo. Here were recovered twenty bands of sheet gold, 0.20 m. in length and 0.05 m. wide, ornamented with spirals, rosettes, etc.; two bracelets; 12 palmets; two large and two small rosettes, and seven gilded bronze heads of lions, as well as many other small objects, all of which originally belonged to chryselephantine statues whose heads, hands, and feet have been found.

At Dendra in Argolis, Professor Persson of the University of Upsala found rockcut Minoan tombs from which he recovered gold plates, necklaces, a number of other ornaments, including many objects of silver, and about one thousand bits of amber. There were in all five tombs. One, dating about 1400, seems to have been that of a princess, another a royal burial of about 1350 B.C. The latter is one of the largest chamber tombs ever discovered; in it much gold was found, and, among other things, a beautifully wrought cup weighing 100 grs.

At Eleusis, where the Greeks this year have continued their excavations, traces of a seventh century building on the site of the Sacred House have been found. At the south end of the building a grave of a youth dating from the geometric period was uncovered.

Five months' work by the Germans at Olympia has uncovered the stoa located on the south side of the Altis. The evidence forthcoming now shows that the building belongs to the fourth century instead of the Hellenistic Age. As a result of the digging it is also now possible to follow the history of the stadium. The oldest, belonging to the sixth century, simply afforded a place where the spectators either stood or sat on flat mounds which enclosed the course on all sides. One side made use of the natural slope of the hillside, the other was artificially constructed. A regular slope on both sides was not given the

place until 460 B.C. At this time the stadium assumed the conventional form, but at no time did it have stone seats. The most extensive remodelling came in the fourth century B.C. Not the least interesting of the finds were a number of round bronze shields and a couple of bronze helmets, which were discovered on top of the archaic south mound where they had been laid when the stadium had been remodelled in the fifth century. These were votives, and the shields had once hung on posts set in the mound at this place.

One of the most thrilling finds of the year was at Pylos where the expedition of the University of Cincinnati and the Greek Ministry of Education uncovered what may be Nestor's palace. On the hill called *Ano Eglianos* a late Mycenaean palace was found, which, while as yet not entirely cleared, is at least 60 by 65 m. in extent. In a small room about three meters wide in the southern part of the building at least 600 inscribed clay tablets were found, which show a script practically identical with that of Crete. They are the first tablets found on the mainland of Greece, and are of the linear, class B type of Crete. They are clearly inventories of the late thirteenth century.

Of equal interest with the finds at Pylos are the discoveries made by Professor Marinatos at Thermopylae. Here he has established beyond question the hill to which, Herodotus says, Leonidas' body was carried by his three hundred Spartans. The countless arrowheads would bear out Herodotus' statement that the sun was darkened by the cloud of arrows shot by the Persian archers. Here also was found the Wall of the Phocians from which the Greeks made their successful charge before they were betrayed. The wall shows the hasty repairs of which Herodotus speaks, and in it was found embedded a stone gatepost proving that the wall contained the gate which gave the name to the place.

A late Roman and Early Christian cemetery has been uncovered outside the city wall of the city of Aosta in Italy. In the more ancient graves the burials were covered with penthouse roofs of tiles. At Beneventum the *cavea* of the theatre has been cleared; at one end of the *scena* is a large hall with the walls veneered in marble. In the eastern corner of the excavated area at Herculaneum were found some wax tablets and *graffiti*. At Petralia in Sicily the so-called "Grotta del Vecchiezzo," three hundred feet deep, has been cleared. It proved to be a cave artificially adapted by primitive man, and had been used as place of worship. From it were recovered many specimens of pottery, stone, and bone. The vases are related in style to those of central and western Sicily.

In preparation for the World's Fair of 1942 a large area at Ostia is being cleared; at present the "Small Market" has been completely bared. In the area between the *Harria Epagathiana et Epaphroditiana* and the ancient shoreline the digging has brought to light several streets, whole blocks of houses with shops, and the offices of *collegia*. Another hotel with the upper stories partially preserved has also been found.

At Pompeii, in *Regio I, Insula VIII*, a number of houses of the "tufa" period have been uncovered. One of these, because of its frequent restorations, has been called the "House of the Four Styles." Nearby was found one of the best preserved dyeing establishments in Pompeii. In one house was discovered an ivory statue be-

lieved to be Indian. Near the middle of the north side of the Circus Flaminius, in Rome, has been found a building which may be the Temple of Bellona.

OLIVER S. TONKS.

ARCHERY. See SPORTS.

ARCHITECTS, THE AMERICAN INSTITUTE OF. A society founded in 1857 to organize and unite in fellowship the architects of the United States, to combine their efforts so as to promote the aesthetic, scientific, and practical efficiency of the profession; to advance education in architecture and in the arts and sciences allied therewith, and to make the profession of ever-increasing service to society. The corporate membership of its 70 local chapters in 1939 numbered more than 3000 of the practicing architects in the United States. The official organ of the society is *The Octagon*, a *Journal of The American Institute of Architects*.

The officers elected at the convention held at Washington, D. C. on Sept. 25-28, 1939, were: President, Edwin Bergstrom, Los Angeles; Vice President, Walter R. McCornack, Cambridge, Mass.; Secretary, Charles T. Ingham, Pittsburgh; and Treasurer, John R. Fugard, Chicago, Ill. The executive secretary is Edward C. Kemper. Headquarters are in *The Octagon*, 1741 New York Ave., Washington, D. C.

ARCHITECTURE. By a miracle of good fortune, 1939 ended with the architectural treasury of Europe substantially intact despite the new war. Of the heavy destruction in Warsaw and the modern Polish cities there was no accurate inventory. To the end of the year, the damage to the southern cities of Finland, possessed of one of the finest bodies of contemporary building in Europe, was apparently light.

The war ended a decade. It had begun with internationalism predominant and a major historic design transformation well under way throughout the world. It also began with world-wide business depression, and ended with architectural planning and design thrown into separatist nationalistic paths. In the United States the depression ended the great skyscraper era and threw the energies of the best architects into a wholly new field, that of housing. "Modernism," which had come to dominate the architecture of England, appeared to be gaining ascendancy here. The year 1939 was marked by rapid improvement in the volume of construction, and by the interest in architecture generated by two major fairs. See **BUILDING; HOUSING**.

The Fairs. With more than thirty million admissions, the World's Fair at New York and the Golden Gate Exposition at San Francisco put their huge architectural displays before a larger audience than had ever been assembled on the continent. Of the two, the San Francisco exposition was by far the more modest in its size and aims, playing for entertainment rather than edification, and was far more successful as a unified conception. Especially in its western part, it was frankly a large outdoor stage set. The site, on Treasure Island in the San Francisco Bay, afforded some of the most remarkable landscape views in America. The scheme, in the western part, of closed courts, protected the visitor against prevailing winds, gave the effect of a fairland closed off against everyday reality, and permitted the soft suffusion of the whole in the most beautifully controlled colored nightlighting yet achieved in any exposition in the United States.

In the eastern part of the exposition, dominated by pavilions built for government bodies, the California architects contributed handsomely to the most progressive trends in architecture in their light, dramatic, latticework handling of construction in the new plywood. Outstanding was T. L. Pfeuger's U.S. Government group, twin low-lying rectangles (with mural fronts) separated by a dominant free-standing central pavilion, an open roof supported on a cluster of 48 highly decorative plywood open-lattice columns. (Especially merit attached to that part of the exhibit devoted to the American Indian, laid out by Rene d'Harnoncourt & H. Klumb.) Other handsome structures in this governmental group were: the California Auditorium (also by Pfeuger); the Alta California and San Joaquin Valley county buildings by Ernest Born. Further splendid fresh examples in wood: the Hall of Flowers (M. Daniels, arch.; F. Chapman, C. Seage, collab.), and Yuerba Buena Club, nearby, by W. W. Wurster, its handsome latticed exterior charmingly correlated with the close poplar planting. (See **GOLDEN GATE INTERNATIONAL EXPOSITION**.)

In New York the "trylon and perisphere" and the ramped "helixline" (by Harrison & Fouilhoux) succeeded beyond expectation; they were a photographer's dream and pictures became ubiquitous. The exhibits, covering more than a thousand acres, more than any known previous fair, gave residents a summer's occupation. The best achievements were individual exhibits, especially those by industrial designers and the foreign architects. To students of recent large expositions elsewhere it appeared as if the guiding spirits of the Board of Design, quite unpracticed in planning for the type of design they proposed to handle, had conceived of "modernistic" (as the publicity men called it) as merely an amiable chaos, to be held together with tag-ends of Beaux-Arts formalism. The encouragement this example might give to bizarre accretions along the nation's highways and in its small towns, thrown together haphazard but without the saving space or bunting of the Fair, could give pause to the judicious.

The popular "smash hit" of the Fair was the great moundlike home of General Motors, because it housed Norman Bel Geddes' futurama of Highways and Horizons, whose glorification of elaborate traffic facilities was viewed from individual moving chairs.

An equal preponderance of educated and professional opinion seemed to fasten upon the small Swedish pavilion, by Sven Markelius, as the outstanding architectural performance; numerous commentators fell concertedly on the word "civilized." The grouping was composed of an outdoor restaurant, a pair of display rooms, and an arrangement of open shelters—their wing-like roofs supported with technical finesse—all thrown about a charming pool and garden. A special air of grace characterized the union of words and symbols chosen to convey a neighborly people's hopes and aspirations: how the Swedes manage their resources, what they were doing to secure homes, recreation, healthy babies, and the other things that make life human; against the propaganda elsewhere in the Fair this was especially welcome.

Other points of interest were too numerous for description: Finland's remarkable transformation of a rectangular room by the Aaltos' spectacular forward-leaning wavy wooden screen; the Cor-

busierish pavilions of the South American countries, Brazil being noteworthy on its own (L. Costa, O. N. Soares, arch's.; P. L. Wiener, exhibits); Italy's bold waterfall which, however, with Roma on top, was thought by some to have taken "the step that lies beyond the sublime"; Russia's monumental horse-shoe, thrown about the proletarian in stainless steel on a red shaft, the greatest popular favorite and a masterpiece of vulgarity in both meanings (B. M. Iofan, K. S. Alabian); Poland's gilded basket tower (J. Cybulski, J. Galinowski, arch's.; Cross & Cross, assoc.); Belgium (van de Velde, Stynen & Bourgeois) stately and reposed despite miserable exhibition technique in the main hall; Ireland (M. Scott, L. H. Bucknell), a shamrock that surprisingly made a good building; the house-like type of all Scandinavian countries as opposed to the monumental type affected by empires and dictators alike. Among commercial exhibitors: Ford (W. D. Teague, des.; C. C. Colby & R. R. Kilburne, assoc.; Albert Kahn, Inc., arch.) with its exciting picturesque use of a spiraling outside ramp and the fine three-dimensional exposition, with stylized little dolls, of the cycle of production; Petroleum Industries (Vorhees, Walker, Foley & Smith) like a great blue triangular kite; Budd Mfg. Co., by the same architects, a vivacious set of umbrella-like stainless-steel shelters; Distillers (Morris Sanders) with its freshly handled gardens and decorative name-shield. In the amusement area, George Howe and his associates did especially well with the Children's World, not meddling with the familiar rococo of merry-go-rounds and the like, while adding wittily a series of standardized modern shelters. Many other exhibits of perhaps equal merit must remain unmentioned for lack of unlimited space.

Residential. In 1939, residential construction valued at \$1,340,000,000 passed the billion mark for the first time since 1930; meanwhile the average cost per dwelling had dropped during three years by 10 per cent to \$3611, leaving open the question of whether better design and wider consumption had raised the standard of living.

The most notable public housing project under USHA was Queensbridge, N. Y., the largest yet, serving 3149 families (W. F. R. Ballard, chief arch.; H. S. Churchill, F. G. Frost, B. C. Turner, assoc.). Its unprecedented Y-shaped (6-story) units turned out well in relation to landscaping. Other projects: Brentwood Park, Jacksonville (M. C. Greely, chief; Smith, Drake, Segerberg, Fetner, Sheftall, Bryson, assoc.); Santa Rita, Tex. (H. F. Kuehne, chief; B. E. Gieseke, A. W. Harris, assoc.); Willert Park, Buffalo (F. C. Backus, arch.).

Leading apartment projects using FHA mortgage insurance were Olentangy Village, Columbus, O. (R. C. Snow, arch.); Wyvernwood Village, Los Angeles, Cal. (D. J. Witmer, L. F. Watson, arch's.; H. Sadler, landscape arch.), and Interlaken Garden apartments, Westchester Co., N. Y. (deYoung & Moscovitz, arch's. G. D. Clark & M. Rapuano, landscape arch's.). Both the USHA and the FHA schemes represented the much higher standard that had been carried into average practice since the first housing idealists had pushed through their decisive innovations, in schemes for people too poor either to pay or to resist.

The enormous "Parkchester" apartment scheme in the Bronx, New York, under way for the Metropolitan Life Insurance Co., surpassed all

government projects in size, being laid out in 12,-273 dwelling units for about 40,000 occupants. (R. H. Shreve, chief). Planners were inclined, however, to compare the site plan unfavorably with the better class of subsidized work. Another large and very imposing apartment group was "Castle Village," by G. D. Pelham, Jr., for Dr. Paterno on the site of his former well-known castle. The five separate 16-story x-shaped units added a good strong note to what was already the superlative urban landscape above the George Washington Bridge; situated on a bluff 200 feet above the river, their x-like arrangement opened the magnificent view to 512 of 569 apartments, although it might be said that only a real estate mind could have felt itself compelled to assign the four best corners, with expensive curved corner windows, not to living rooms but to bedrooms.

Among private houses, the difficult small type predominated more than ever. If Cape Cod were not to be the only attractive solution, much work was called for. Promising solutions: at Midland, Mich., by A. Dow; Lexington, Mass., by S. Glaser; Portland, Ore., by J. Yeon; Kirtland, O., by B. J. McGarry for Contemporary Houses, Inc. Among further efforts at prefabrication, the demonstration house at Lebanon, N. J., by J. B. Pierce Foundation (J. L. Davison, director of research) had the advantage of permitting indeterminate wall lengths and almost completely free placing of openings by very simple means.

The choice of larger houses for mention must be somewhat arbitrary. European continental modernism was spreading fast but its use was often so mannered and timid as to make it another meaningless traditionalism; consequently the quarrel in the press had little substance to go on. Among the better houses allied to contemporary Europe, those at Lincoln, Mass., by the well known Gropius & Breuer, pioneers in the movement, had the authentic elegant touch, revealing, incidentally, that the absence of American "modern" furniture can greatly assist a progressive design. Other houses, more or less allied in trend: at Tuxedo Park, N. Y., for Alfred Loomis, by W. Lescage; in Denver, a good swinging plan for the Bromfields, by B. Hoyt; Neutra's house for John Nichols Brown on Fisher's Island and his Albert Lewin house, Santa Monica, Cal., both overlooking oceans.

Houses suggesting some affinity to Frank Lloyd Wright: the Midland, Mich., houses of A. Dow; two houses in Indiana by John Lloyd Wright (fils); Walter Kohler house, Kohler, Wis., by W. E. Deknatel. Wright's own "Suntop Homes" at Ardmore, Pa., placing the kitchen split-level to constitute an observation turret for the whole house, was characteristically pregnant with possibilities and productive of controversy.

Houses suggesting unhampered progressive approach: the Fair houses scattered about San Francisco, by W. W. Wurster, Birge M. and David B. Clark, G. A. Daily, all characteristic up-to-date California houses; G. Howe's summer house for Mrs. Clara Fargo Thomas on Somes Sound, Me., cantilevered over the coast-line on its stunning site; a house at Evanston, Ill., by Perkins, Wheeler & Will; at Highland Park, Ill., by Schweikher & Lamb; ranch groups, respectively, for E. L. Walbridge, Sonoma Co., Cal., by E. T. Spencer, and for S. Meigs at Carpinteria, Cal., by W. H. Francis. Strictly traditional eclecticism was best, as usual, where history supplied the shell for remodelling, as in the delightful farm

group for J. L. Eastwick, Chester Co., Penna., by J. L. Evans.

Institutional Building. Museums. The opening of the Museum of Modern Art in New York, in itself a wide-ranging display of up-to-date designing, was a colorful architectural event, due mainly to the pageant-like character given the brightly dressed crowd by the combination of garden, roof terraces, and intermittent glass walls under nightlighting. The building stepped entirely out of the palace type and belonged, in terms of structure and underlying plan, with lofts and department stores. (P. L. Goodwin & E. D. Stone, arch's.; C. S. Stein, consult.)

The competition for the proposed Smithsonian Gallery of Art in Washington was the first open competition for a large Washington building since Jefferson. The winners were Eliel & Eero Saarinen; close runner-up, P. L. Goodwin.

Hospitals took on the sober forms of free design with ever more articulated planning. A handsome mass was the new Memorial Hospital in New York (J. G. Rogers, H. C. Pelton, assoc. arch's.); another the city hospital of White Plains, N. Y., by Schultze & Weaver. In the small, rural, Little Traverse hospital at Petoskey, Mich., Skidmore & Owings gave a masterly demonstration of design effectiveness despite limited funds.

Schools. An unusually large proportion of the schools published were good, straightforward, and decently scaled. Examples: the high school by Morris & Frewen at Idaho Springs, Colo.; Franklin & Kump's elementary school at Fowler, Cal., and their better, more independent one at Sierra Union, Cal.; the Coolspring School, La Porte Co., Ind., by J. L. Wright. Perry, Shaw & Hepburn's high school at Wellesley, Mass., showed an advance in planning over their Fitchburg School of the previous year; the firm's accustomed finesse was employed on adapting the Scandinavian manner of the twenties.

Public Works and Regional Planning. T.V.A. The architectural press chose 1939 for enthusiastic recognition of the work quietly done by the Tennessee Valley Authority since 1933. If their opinion were to be generally accepted, the project might come to stand in history as a great twentieth-century achievement of a democratic government, not only for the high-hearted quality of the design and the interplanning of multiple regional interests but for the pompless manner of taking the citizen into partnership by means of thoughtful facilities for his education and pleasure.

Bridges. (q.v.) The Bronx-Whitestone suspension bridge to Long Island was finished in time for the Fair, and roused commentators to superlatives of praise, some declaring it the finest suspension bridge design of large scale yet done. (O. H. Ammann, ch. eng.; Allston Dana, eng. of design; Aymar Embury, arch.) New York architects, whose A. I. A. chapter had joined in the fight against the proposed Brooklyn-Battery bridge, were meanwhile pleased by the presidential interdiction of a well-meant scheme which they felt would have ruined the famous downtown skyline.

Commercial Buildings. At Rockefeller Center the completion of "Building No. 11" and commencement of the final structure forecast the completion of the great group which, despite glaring plan errors, still represented the culmination of the great American skyscraper effort. (Rein-

hard & Hofmeister, W. K. Harrison, J. A. Foulhoux, architects of No. 11.) The National Broadcasting Co.'s big new studio at Hollywood (by O. B. Hanson, NBC ch. eng., & Austin Co.) made use of wide-ranging plans to diminish acoustical problems but the streamlined forms came out of stock.

Stores. Burdine's department store at Miami (E. L. Robertson, J. R. Weber, arch's.; Miss E. Lemaire, interior designer) carried forward the newer clean-cut fashion with extensive use of glass block in a handsome way. A number of small specialty stores made use of the new tempered plate glass in doors giving the startling effect of a wholly open interior: e.g. a haberdashery shop in New York by Ketchum & Gruenbaum.

Industrial. B. B. Chemical Co., Cambridge, Mass., by Coolidge, Shepley, Bullfinch & Abbott might serve as an example of the typical better industrial designs.

Great Britain. Besides throwing architects into confusion, the war produced incongruities such as the accommodation of evacuated city-dwellers in historic Blenheim. The employment of T. S. Tait of Tait, Burnett & Lorne, to devise standard camp plans for large-scale prefabrication, resulted in excellent layouts, opening the possibility of post-war recreational use on a scale comparable with what the dictators regularly do for their people.

The Cabinet surprised technicians by rejecting the considered and up-to-date plans of the Borough of Finsbury for air-raid protection, drawn up by the enterprising firm of Tecton. The Government's own first efforts in this field were not impressive.

Not connected with the war, an event of great importance to all countries was the outcome of the so-called Borders test case. Here an energetic woman acting in her own behalf got the principle established by Mr. Justice Bennett that reputable building loan societies, in taking over financing arrangements for jerry-builders, thereby associate themselves in a "fundamentally dishonest business" of providing dwellings unfit for human habitation, and can be held legally culpable.

In large commercial and public buildings there was reigning conservatism within the contemporary trend. The headquarters of Imperial Airways, Ltd., in London, by A. Lakeman, carried more weight of Empire than lightness of air. Commonwealth House, High Holborne, followed Dutch precedents of the twenties in its romantic terraces and waved surface treatment. The new Liverpool Philharmonic Concert Hall, by H. J. Rowse, a tall front with twin curved projecting turrets of obscure usefulness but monumental effect, had similar affinities. By contrast, in a small library on the Park Estate, Leicester, the architect made splendid functional use of a rotunda with a cloverleaf arrangement of outrooms that at first looked only like geometry on a triangular lot. Full publication of Impington Village College (by Gropius & Fry) emphasized its many-sided instructiveness as a model and also revealed kinship with American plan types (Neutra's in Los Angeles) and purposes (a rural cultural center comparable to the school at Hightstown, N. J.).

Town halls were variously given conservative contemporary or modified Georgian dress over similar plans. Good massing characterized the Greenwich Town Hall, by C. G. Culpin. Among

excellent hospitals were the one at Chichester (C. G. Stillman, arch.), Luton & Dunstable Hospital (by Parrott & Dunham), London Fever Hospital (by Clifford Webb) with its precautions against cross-infection, and the unusually good Nurses' Home at Macclesfield by Frederick Gibberd.

Among recreational facilities, the New Casino at Blackpool (J. Emberton, arch.; H. Best, assoc.) was of the glass rotunda type, with a fanciful corkscrew staircase in front for gayety; holiday establishments such as Prestatyn Holiday Camp in Flintshire (Wm. H. Hamlyn, arch.) packed 900 people into "chalets" surrounded by unlimited facilities that would make an American tourist camp proprietor's eyes pop.

In residential building by far the most entertaining single event seemed to be Tecton's penthouse interior for the top of Highpoint II. (1938 YEAR BOOK, page 53). This was for those bored with flat cubical interiors and the all-pervasive chrome finish of the usual up-to-date Continental interior. Such ingredients as a wave-curved ceiling, rough pine wall panels of the cut that American woodsmen call "brainstorming," rustic log chairs, Victorian curly iron chairs, a table on a cantilevered T-iron support, cowhide covers, selected driftwood knots, and more, were stirred with a deftness that brought a result even more unquestionably smart than what had gone before.

Germany. Germany went into the war from the midst of a great building boom. Annual dwelling production in 1936-38 had averaged over 300,000 units, approximately equal to the output in the high years 1928-30. In 1938, 38 per cent received government subsidy. The government's share in total building production was four-fifths; despite a desperate shortage of materials, especially wood, the vast monumental schemes for "putting the stamp of National Socialism" forever on the big cities had continued; in addition, in 1938-39, the West Wall fortifications consumed a high percentage of the total. Dr. Todt was appointed dictator over the building industry and the list of buildings scheduled was cut in half.

The strongest peculiarity of German architecture lay in the special building types produced. These included numbers of barracks, always in open country; 600 youth hostels to hold country youth in the small villages; larger hostels with tight bunks for youth wandering to heroic shrines, such as the Marienburg;—encouragement to peasant building in traditional forms with maximum handicraft expenditure on elaborate joinery and the like; recreation buildings for the labor corps of individual factories; large new plants for favored industries, e.g. the excellent Junkers auto and airplane plant in Dessau, designed by W. Issel; and the projected "city of 22,000" around the new Hermann Goering works; finally, of course, there were the enormous monumental buildings of the government. In addition, Germany since 1934 had been as far ahead in the art of building for aerial defense as she was in the airplane industry.

Architecturally, these building types tended to fall into strict style categories, corresponding somewhat to European habits at the time of Hitler's youth: i.e. a congeries of neo-classicisms in the government buildings, adding up to the peculiar "Albert Speer" stiffness; medieval ideals in residential construction including the largest; clear-cut functionalism strictly limited to the production units within factory groups. In luxury

houses, an old hand like F. A. Breuhaus might manage, in a Berlin example, to achieve quite a nice open contemporary wing plan, provided he supplied a romantic tower as a sort of knee-cap.

Italy. Though free of eclecticism, Italian architecture tended to become ever more formalized. A surprisingly large group of buildings in Italy are the new mass recreation centers, of which the "Colonia XXVIII Ottobre" furnished a prominent 1939 example. In designing a whole satellite town for industrial workers, the architects A. Sartoris & G. Terragni were able to make Rebbio a demonstration piece of Italian plastic skill, faultless scaling, and clean detail. The office building for the Montecani Co., Milan, by G. Ponti, with the usual careful proportioning and extreme restraint, was the last word in the world in convenience and equipment. The Augustinian bimillennial exposition showed how close modern Italy can be to Rome at its most pompous; the Leonardo memorial exposition furnished one dramatic detail, the plaster models of flying figures supported on pipe-work scaffolding; the Palace of Italian Culture, the most telling of the designs for the projected Rome Exposition of 1942, a cube with each face showing about a hundred arched openings equally spaced in both directions, and mirrored again in a pool, with no sign of any capital or molding, showed the brutal simplicity with which Fascist designers can surpass even the famous front of the Pitti Palace (Guerini, Padura, Romano, arch's). Perhaps by coincidence, the usual strain of work of functionalist character was absent from the Italian architectural press.

Switzerland. The Swiss National Fair on the Lake of Zurich constituted one of the year's finest architectural events. Built compactly on two sides of the lake, with a cable car connection, at a total cost of around 4½ million dollars (slightly more than the Soviet pavilion alone in New York), this gay little exposition actually outdrew the great New York Fair in the early days with a record attendance one holiday of 180,000. The wood construction was handled throughout with light-hearted virtuosity; the placing of the sculpture, such as the white boy and horse on the shore of the lake, made the solution at New York seem loutish. People were carried right through under the buildings by means of the "Schiffbächli," an ingenious little canal through which water was pumped to propel the boats.

Belgium. Belgium's international exposition of the year was at Liege, situated in a future park on both sides of the Meuse; the subject was the use of water. The vistas were well organized and very pleasant, but the buildings erected by the various countries were more conventionally modern than those of the Swiss show. Germany, missing from fairs since Paris, 1937, was back in with a building by M. Fahrenkamp, absolutely in the official style.

Other Belgian buildings: the central railroad station, Brussels, by Baron Horta, with clear organization visible on the exterior, in the tradition of Perret; I. N. R. Broadcasting Station, by J. Diongre, the continuation of horizontal treatment up the rounded little tower turning it into something of a candy-stick; houses, at Brassaet, by P. & C. de Nys, and at Rhode-St.-Genese, by Victor Bourgeois.

THE MUSEUM OF MODERN ART

The new building of the museum at 11 West 53rd Street, New York City. The architects were Goodwin & Stone.

went to designers using wholly historic forms, with a faithfulness of reproduction rarely seen any more in Europe. Especially hard-fought was the battle at Amsterdam, where the jury put on display two finalist schemes: one, by M. Duintjer & A. Komter, a mild contemporary performance, the other, by J. F. Berghoef & the engineer J. J. M. Vegter, undisguisedly medieval. The latter was ultimately selected. Not much distinction attached to the other winning designs, at Eindhoven by J. v. d. Laanz, and at Maaslied by E. H. A. and H. M. J. H. Kraagvanger. Other Dutch buildings: the St. Homobonus Co-operative administration building, by G. H. Holt; the exposition of "Ideal Living," a pleasant open-spaced affair, by T. Th. Wijdeveld; radio station at Hilversum by Duiker, Merkelbach, Karsten; a very personal and original house, with a handsome play of pitched roofs—one of them like a grandstand—by the engineer J. W. C. Boks.

Denmark. Among many unpretentious and freely conceived structures were two modest houses, one by Frits Schlegel for himself near Copenhagen, another by Arne Jacobsen. The open-air school at Sundby for children of delicate health, by K. Gottlob, made numerous plan innovations.

Finland. By the end of 1939 damage from air bombardments had apparently not been extensive; this was fortunate from an architectural as well as a humanitarian viewpoint, since the cities of southern Finland in their rapid growth had made use of a very high average of very up-to-date designing. Typical recent apartments at Helsinki were those by V. Leisten; a handsome group, 7 stories in height plus roof-terrace, by Aalto, Kokko, & Saari; a somewhat bizarre one, the zig-zag balconied front by Aalto, Kokko; nice detail in a small apartment was executed by Dag Eglund. The new municipal bus station at Abo, by the municipal building office, might well serve American cities as an example; also at Abo was the headquarters of the Sampo mutual life insurance company, by E. Bryggman: behind an unostentatious exterior it enclosed a skilfully handled plan managing a diversity of facilities such as offices, arc hives, lunchrooms, and a rented restaurant, with a richly varied use of materials and forms.

Japan. Japanese architects could design European architecture as well even as an Italian, witness the Osima Meteorological Observatory, by Sutenu Horiguti, or the Keio-Gidynku Dormitory near Tokyo by Y. Tarriguti. The grandstand of the Kyoto racetrack at Kyoto, by T. Yasui, had a more northern flavor. A building like the Meijiseika Tea Parlor, by J. Watanabe, suggested Japanese influences gone abroad from whence they again influenced the homeland back again. Among houses, a retreat for Akamatu at Jugawara, by Yoshiko Dusi, thatched covered, based throughout on the Japanese mat module, used European details without conflict; the Yamazaki house, by T. Kurata, was pleasantly Japanese traditional; a hilltop studio for the artist Tuzi at Hakone by Eizo Sugawara was a picturesque agglomeration of European rustic wooden types handled with Japanese delicacy.

ARCTIC EXPLORATION. See POLAR RESEARCH.

ARGENTINA. A federal republic of South America, consisting of 14 Provinces, 10 Territo-

ries, and the Federal District, which includes the capital, Buenos Aires.

Area and Population. Land area, 1,079,965 square miles. Population, 12,958,217 (estimated) on Dec. 31, 1938, compared with 7,885,237 at the 1914 census. Living births registered in 1938 numbered 293,989 (24.1 per 1000); deaths, 148,435 (12.0); marriages, 85,015 (7.0); excess of immigrants over emigrants, 34,708. Estimated populations of the chief cities on Jan. 1, 1938, were: Buenos Aires, 2,317,755 (2,470,000 on Jan. 1, 1939); Rosario, 511,007; Córdoba, 288,916; Avellaneda, 230,775; La Plata, 190,577; Santa Fé, 143,327; Tucumán, 140,000; Bahía Blanca, 108,310.

Education and Religion. About 16 per cent of the adult population was estimated in 1939 to be illiterate (less than 2 per cent in the federal district). The public education budget of about \$37,500,000 for 1940 was more than the aggregate educational appropriations of the nine other South American governments. Argentina's sixth national university was opened at Mendoza on Mar. 27, 1939. Known as the University of Cuyo, it draws its student body from the provinces of Mendoza, San Juan, and San Luis and has branches at the two other provincial capitals. The other national universities at Buenos Aires, Córdoba, La Plata, Tucumán, and Santa Fé (El Litoral) had 27,885 students in 1937. The Roman Catholic Church is supported by the state; all other faiths enjoy freedom of conscience.

Defense. Defense forces in 1938 included a standing army of 38,400 men; a trained army reserve of 300,000 men in the National and Territorial Guards; military and naval air forces with less than 200 planes in all; and a naval force of 2 old battleships, 3 cruisers, 4 old coast defense vessels, 16 destroyers, 3 submarines, 16 patrol vessels, etc.

Production. Agriculture and stock raising, and manufacturing, are the principal industries. Of the 1938 exports, livestock products accounted for 45.6 per cent by value and agricultural products for 47.4 per cent. Yields of the chief crops in 1938-39 were (preliminary, in metric tons): Wheat, 8,700,000; barley, 440,000; rye, 270,000; oats, 730,000; corn, 5,400,000; potatoes, 952,000 (1937-38); cane sugar, 460,000; linseed, 1,410,000; cotton, 65,000. The 1938-39 wool clip was 174,600 metric tons. The number of animals slaughtered at frigorificos in 1938 was: Cattle, 4,421,439; swine, 1,015,622; sheep, 5,799,990. The chief mineral product is petroleum (2,430,000 metric tons in 1938). Tungsten, lead, zinc, copper, gold, silver, and coal are mined in relatively small quantities. There were 40,613 industrial establishments, with 526,495 employees and executives, at the 1935 census.

Foreign Trade. Exclusive of specie, imports in 1938 totaled 1,460,888,000 pesos (real value) and exports 1,400,294,000 pesos. Leading 1938 imports were (in millions of pesos): Textiles, 287.8; fuel and lubricants, 229.0; machinery and vehicles, 226.8; iron and its manufactures, 129.6. For trade by countries, see 1938 YEAR BOOK. Imports (1939), 1,338,332,000 pesos; exports, 1,570,226,000.

Finance. For 1938 general expenditures totaled 949,700,000 pesos and receipts 934,700,000 pesos. Special expenditures and receipts balanced at 45,900,000 pesos. Budget estimates for 1939 placed general expenditures at 988,785,221 pesos and receipts at 854,319,675 pesos. Stating that it was impossible to appraise the results of the European war upon government finances, the President in-

duced Congress to re-enact the 1939 budget for 1940 with the addition of 43,000,000 pesos for debt service.

National public debt (Dec. 31, 1938), 3,896,600,000 pesos, against 3,770,100,000 on Dec. 31, 1937. The Federal Government during the year assumed 18,500,000 pesos of provincial debt and 54,000,000 pesos of City of Buenos Aires debt. The Argentine paper peso exchanged in 1938 at an average of 3.92 pesos per U.S. dollar on the free market and 3.31 at the official rate.

Transportation, etc. On June 30, 1938, Argentina had 26,531 miles of railway line, of which 6365 miles were state-owned. Early in 1939 the Federal Government acquired the Argentine section of the Transandean Railway, the Córdoba Central Railway, and the Steam Tramway of Rafaela, all owned by British interests. According to the *London Times*, the 280,000 British bondholders with an investment of £277,000,000 in Argentine railways received interest payments averaging 1.6 per cent on their investment in 1938. Highways of all types aggregated 254,646 miles in 1939. It was decided in 1939 to recondition the Transandean railway tunnel to provide for both rail and automobile traffic. The German air line connecting Buenos Aires with Europe suspended operations upon the outbreak of the European war. Early in 1939 the government authorized the Italian air system, "Ala Littoria," to establish air mail and passenger service between Rome and Buenos Aires. Services of Pan American Airways, connecting Buenos Aires with Asunción, La Paz and the principal cities on the east and west coasts of South America, were increased. During 1938 2349 ships of 9,021,010 net registered tons entered all Argentine ports (3245 ships of 11,408,981 tons in 1937).

Government. The Constitution of 1853 vests executive power in a president chosen for a six-year term by 376 electors representing the Provinces and the Federal District. The National Congress consists of a Senate of 30 members elected for nine years by the Provincial legislatures and a Chamber of Deputies of 158 members elected for four years by universal male suffrage. One-third of the Senate retires every three years and one-half of the Chamber every two years. The governors of the Provinces, elected by local suffrage, exercise extensive powers independently of the Federal Government. President in 1939, Dr. Roberto M. Ortiz, who assumed office Feb. 20, 1938.

HISTORY

Internal Affairs. The nation's main attention during 1939 was concentrated upon combating adverse domestic repercussions of world economic conditions and European ideological and military strife. Among political developments of the year were the suicide of the influential Dr. Lisandro de la Torre, founder of the Progressive Democratic party (see *NECROLOGY*); outbreaks of violence and charges of fraud in connection with the San Juan provincial election on April 30; and adoption by the chief opposition party—the Radicals—of a platform for the March, 1940, Congressional elections emphasizing opposition to fascism and nazism in Argentina and support of President Roosevelt's inter-American policies.

Economic Measures. The high level of prosperity attained in 1937 slumped sharply in 1938, when poor agricultural conditions and a 40 per cent decline in the value of exports caused a falling

off in revenues and general business activity. In 1939, previous to the outbreak of the European war, conditions became worse. The large 1938-39 wheat crop could not be disposed of abroad and the government, under the decree of Nov. 14, 1938 guaranteeing minimum prices for wheat and linseed, purchased the entire crop at a price of 7 pesos per quintal (about 59 cents a bu. f.o.b. Buenos Aires). Prices on the Liverpool market, where the bulk of Argentine wheat is normally disposed of, remained substantially below this level. It was estimated in July that the government was holding about 158,000,000 bu. of wheat representing an investment of 280,000,000 pesos, and that it stood to lose 100,000,000 pesos on the wheat guarantee program by the end of the year.

The Ortiz Government rejected proposals for devaluation of the currency as a way out of its financial dilemma. Government expenditures were drastically pruned. Two internal bond issues totaling 150,000,000 pesos were floated in March. Barter agreements concluded with Italy and Germany reduced the wheat surplus. The policy of rigidly curtailing imports to the level of merchandise exports was extended, while the government continued to take a handsome profit on its exchange control operations. (In 1938 this profit was about \$18,000,000.) Under the system of import control introduced in November, 1938, the Argentine Government reduced imports from the United States and other countries having a favorable trade balance with Argentina to the level of their Argentine purchases. But on Aug. 23, 1939, a new system of "horizontal control by commodities instead of vertical control by countries" went into effect.

Effect of European War. The outbreak of the European war in September markedly changed Argentine economic and financial conditions. There was a sharp increase in prices of import and export products, accompanied by curtailment of trade with the European belligerents. A decree of September 6 ended government support of wheat and linseed prices. Congress passed drastic anti-profiteering and price-fixing legislation covering a wide variety of articles of prime necessity. There was further fiscal retrenchment. Business showed general improvement under the stimulus of higher prices. But both the government and the banks adopted a conservative policy in the face of an incipient war boom, and the country's economic system absorbed the shock much more easily than in 1914. There was some dislocation of established trade channels, including a marked shift of Argentine trade from Europe to the United States. The peso was pegged to the U.S. dollar when the pound sterling began to depreciate. A German-Argentine barter agreement for exchange of Argentine wheat and wool worth 14,500,000 pesos for German railway equipment broke down as a result of the war, after Argentina had shipped wheat valued at 4,600,000 pesos.

Defense and Neutrality. The war in Europe gave powerful support to President Ortiz's policy of strengthening the national defenses. Legislation for expansion of the army, navy, and air force was introduced, but the military program aroused criticism from Gen. Ramón Molina, retired Chief of Staff, on the ground that it would create too many generals and make the army "a pliable instrument of unscrupulous governments." The Argentine Government proclaimed its neutrality in the European war on September 4 and took energetic measures to enforce it. Test flights of German commercial aircraft in Argentina were for-

bidden on September 10 lest they be used to aid the German naval warfare in South American waters. A naval patrol of coastal waters was inaugurated September 15 in collaboration with Uruguay and Brazil. The officers and crew of the German pocket battleship *Graf Spee*, who landed at Buenos Aires after sinking their ship in the River Plate on December 17, were interned by the Argentine Government despite a sharp protest from Berlin.

Anti-Nazi Probe. On Mar. 30, 1939, the Buenos Aires newspaper *Noticias Graficas* published a document purporting to prove that the German Government was conspiring with German nationals in Argentina to annex Patagonia. The document was supplied by Heinrich Jürges, publisher of an anti-Nazi magazine in Buenos Aires, who said that he was a former secretary of Propaganda Minister Joseph Goebbels. It was denounced as fraudulent by the German Embassy and the Argentine Federal Prosecuting Attorney reported on May 4, after a five-weeks' investigation, that its authenticity could not be proved. Accordingly Alfredo Mueller, acting chief of the Nazi movement in Argentina, who had been arrested as one of the signers of the document, was released from prison and the prosecution of Jürges was recommended.

Nevertheless the Prosecuting Attorney's report stated that the investigation had uncovered extensive illicit and unconstitutional activities by the Nazi movement in Argentina that necessitated urgent governmental action. All Nazi organizations in Argentina, it was charged, were headed by appointees of the German Nazi party and completely controlled from Berlin or Munich. The members were organized on a military basis, made regular subscriptions to party funds in amounts dictated by their leaders, were forbidden to use the Spanish language at their meetings or to become naturalized Argentine citizens. They wore Nazi uniforms, engaged in military drill, and excluded Argentine flags from their meeting halls. German laborers in Argentina were obliged to join the German Labor Front, the report continued. Anti-Nazi Germans were ostracized and black-listed. Nazi activities in all sections of the country displayed complete disrespect for Argentina and the laws of the republic and moreover constituted a danger to Argentine sovereignty.

This report and the accompanying anti-Nazi press campaign was followed by a decree of May 15 dissolving the German Nazi party and all other political organizations in Argentina directed from abroad. The decree affected also the Spanish Fascist party in Argentina and two Italian-controlled organizations—the Italian Fascist and *Dopolavoro* groups. The decree permitted foreign organizations to exist provided they banned all foreign political insignia, uniforms, banners, and songs, refrained from activities for or against political institutions of foreign countries, subscribed to "democratic principles" in their by-laws, recorded their names, statutes and by-laws in Spanish, and dispensed with subsidies and donations from abroad. Protests against this decree from the German and Italian governments were rejected by the Argentine Foreign Office.

When Congress convened, all parties agreed that the judicial investigation into Nazi activities in Argentina was incomplete. On July 7 the Chamber voted 77 to 4 to authorize a legislative investigation of all foreign political activities hostile to Argentina and its institutions. Meanwhile the

anti-Nazi probe had led to further restriction upon or the closing of German and Italian schools under the decree of June 16, 1938, forbidding the teaching of foreign racial or political ideologies and beliefs contrary to the Argentine Constitution and laws.

Foreign Relations. Due in part to the anti-Nazi sentiment aroused by the foregoing disclosures, Argentine opinion showed itself strongly hostile to Germany when the European war began. Standing on its traditional principle of non-recognition of territorial changes brought about by force, the Argentine Government on October 5 announced that it would refuse to recognize German sovereignty over Poland (q.v.) and would continue diplomatic relations with the Polish provisional government.

On the other hand Argentina on September 10 formally protested the inclusion of foodstuffs on the British and French contrabrand lists. The disruption of Argentina's trade with the Reich by the Anglo-French blockade and the failure of the Allies to purchase Argentine wheat and meat in the quantities and at the prices expected caused a cooling of Argentine enthusiasm for the Allied cause. This trend was increased by charges that the British were violating Argentine neutrality by recruiting British residents of Argentina for the Falkland Islands military defense force. In the middle of October an unofficial committee composed of many leading Argentines and headed by the Socialist Senator, Alfredo Palacios, was organized to push Argentina's old claim to the Falkland Islands. Following the Soviet attack upon Finland, Argentina on December 4 demanded the immediate expulsion of the Soviet Union from the League of Nations (q.v.).

Pan American Policy. At the Pan American Conference in Lima, Peru, in December, 1938, Argentina led the opposition to Secretary of State Hull's proposals for closer inter-American collaboration (see 1938 YEAR BOOK, p. 566). But in September, 1939, the Argentine Foreign Office was the first American chancellery to put the Declaration of Lima into effect. All American diplomatic representatives in Buenos Aires were called in conference on the eve of the European conflict and informed of the measures Argentina would adopt if war broke out. This consultation was continued during the remainder of the year, being expanded in accordance with the agreements reached at the conference of American Foreign Ministers at Panama.

Argentine collaboration with the other American countries was manifested in various other ways. The Finance Ministers of Argentina, Brazil, Paraguay, and Uruguay met in Montevideo on January 27 to discuss joint fiscal and commercial policies. They recommended that their governments adopt joint measures to control movements of refugees and other immigrants, tighten relations among their Central Banks, and take specific steps to promote trade relations. An Argentine-Brazilian agreement putting some of these recommendations into effect was signed Apr. 14, 1939.

During a visit made by Gen. José Félix Estigarribia, President-elect of Paraguay, to Buenos Aires, six treaties were signed on July 5 that laid the basis for closer economic, political, and cultural relations between the two countries. They provided for the settlement of the dispute over the boundary line between Argentina and the Paraguayan Chaco; the establishment in Asunción of a branch of the government-owned Bank of

the Argentine Nation; and the establishment of facilities for closer cultural and commercial intercourse and for the transit across Argentina of immigrants bound for Paraguay. The important boundary treaty set up a mixed Argentine-Paraguayan commission to trace the true course of the Pilcomayo River, which was designated as the frontier line by President Rutherford B. Hayes of the United States in his arbitral decision of 1878 awarding the Chaco territory north of the Pilcomayo to Paraguay.

In the middle of August President Alfredo Baldomir of Uruguay arrived in Buenos Aires for a five-day official visit, the first paid to Argentina by a Uruguayan President in 30 years. Argentina vigorously supported Chile (q.v.) in the latter country's dispute with Gen. Francisco Franco, dictator of Spain, over the diplomatic asylum granted Loyalist refugees in the Chilean Legation in Madrid. In June Argentina and Colombia raised their respective Legations in one another's capitals to ambassadorial rank.

The increasingly cordial relations between Argentina and the United States continued to encounter obstructions in the form of economic discriminations arising from the competitive nature of the Argentine and United States economic systems. The United States Senate withheld ratification of the treaty removing the ban on imports of Argentine meat products based upon the discriminatory application of sanitary regulations. The Argentine Government, on the other hand, further curtailed imports from the United States in mid-February in line with its trade-balancing exchange control system. However the new import-control plan adopted by Argentina in August removed the discriminatory features of Argentine exchange control as applied to United States goods. This paved the way for the announcement by Acting Secretary of State Sumner Welles on August 23 that the United States planned to negotiate a reciprocal trade treaty with Argentina. There had been more than four years of preliminary discussions. Direct discussion of the trade pact began in Buenos Aires on November 15. A week later the Argentine Government announced a new import policy for the duration of the European War which restricted purchases as far as possible to Great Britain and France. The Allies apparently agreed in return to continue large-scale purchases of Argentine products. This agreement was a factor in the virtual collapse of the Argentine-United States negotiations by the end of the year. The Argentine Government in 1939 renewed the contract of the United States air mission sent to Buenos Aires in 1938.

Antarctic Claims. Another prospective source of Argentine controversy with both Great Britain and the United States was revealed in 1939 when the Argentine Government established a commission to prepare proofs, supporting Argentine claims to Antarctic territories, for presentation to an international conference of polar explorers to be held in Bergen, Norway, in 1940. Argentina claimed possession of all Antarctic territory lying between the 20th and 68th meridians west longitude, including Graham Land, and the South Georgia, South Orkneys, South Shetlands, and Sandwich island groups, all claimed by Britain, and parts of the Antarctic Continent claimed by Britain and the United States (see POLAR RESEARCH).

See also BOLIVIA, BRAZIL, CHILE and URUGUAY under *History*; INDUSTRIAL CHEMISTRY, MILI-

TARY PROGRESS, PAN AMERICANISM, PAN AMERICAN UNION.

ARIZONA. Area and Population. Area, 113,956 square miles; included (1930) water, 146 square miles. Population: Apr. 1, 1930 (census), 435,573; July 1, 1937 (Federal estimate), 412,000; 1920 (census), 334,162. Phoenix, the capital, had 48,118 (1930).

Agriculture. Arizona harvested, in 1939, 612,500 acres: this was somewhat less than the year before, but it exceeded the average of 579,400 for the decade 1928-37. Cotton, on 187,000 acres, made 197,000 bales (estimated farm value, \$10,342,000); *tame hay, on 218,000 acres, 475,000 tons (\$3,895,000); wheat, on 35,000 acres, 805,000 bu. (\$620,000). Corn, grain sorghums, dry beans, and other crops were also grown, on a smaller scale.

Manufacturing. Figures published in 1939 by the U.S. Census of Manufactures were as follows, for Arizona in 1937 (corresponding figures for 1935 in parentheses): number of manufacturing establishments, 290 (272); wage-earners there employed, 7193 (4748); wages paid, \$8,602,418 (\$5,033,516); value of products, \$118,355,981 (\$55,456,045); part of this value contributed by manufacture, \$33,634,686 (\$16,172,583). The smelting and refining of copper accounted for \$79,601,203, or much the greater part, of the value of all the manufactured products of Arizona for 1937; the smelters and refineries occupied 2262 of the manufacturing wage-earners.

Mineral Production. Mines in Arizona recovered to a great extent from the slump in yearly production that they had suffered in 1938. Their aggregate output of gold, silver, copper, lead, and zinc rose to \$72,433,400 (1939; preliminary approximation), from \$58,358,401 (1938). The output of ores of copper increased in metallic equivalent to 518,400,000 pounds (1939), from 421,594,000 (1938); in metallic value to \$53,913,600, from \$41,316,212. The yearly yield of gold advanced to 323,000 ounces (1939), from 305,043 (1938); in value, to \$11,305,000, from \$10,676,505. That of silver, to 7,975,540 ounces (1939), from 7,479,153 (1938); by value, to \$5,413,700 from \$4,835,008. The corresponding value for output of lead in 1939 was \$1,075,000; for that of zinc, \$726,100. Preparatory work at the Morenci mining property of the Phelps-Dodge Corporation on a new body of ore and on equipment for concentration was opening the way in 1939 for a future additional production of copper in the State.

Political and Other Events. Gov. Robert T. Jones took office in January. A dispute with New Mexico over the use, for irrigation, of water of the upper Gila River, in the latter State, came to a head when an official reported as acting on order of Governor Miles of New Mexico (January 4) forced the padlocks that closed the outlets for this water to the area around Virden, just east of the Arizona border. The padlocks had been affixed in October, 1938, by order of the Federal District Court in Arizona and in accordance with the purpose of the Federal water commissioner for the Gila River, to conserve water that the Indians of the Pima Reservation, in Arizona, would need for their agriculture. The Federal Government was consequently a party in the dispute and in the subsequent moves for its termination. The Federal works in the Gila River were increased later in the year by preparations for the placement of three pumping units designed to lift water from the main gravity canal of the

Gila project, and thus supply irrigation to the Yuma Desert, in southwestern Arizona.

The 400th anniversary of the white man's discovery of Arizona (which the Spanish Franciscan Marcos de Niza had entered in 1539), was celebrated at divers dates and in various parts of the State; at Lochiel a memorial stone shaft bearing inscribed bronze plates, one in Spanish and one in English, was dedicated April 16; Tucson held a pageant, April 27.

Investigators reporting to WPA Administrator Harrington on the condition of migratory workers in the Western cotton States were quoted (September 30) as finding that the greater part of those questioned in Arizona had been drawn there by persuasive advertising, but that few of them had found it possible to earn an adequate income at cotton picking.

Drought in the Navajo Indian reservations (lying chiefly in northeastern Arizona) cut down the food supply of these Indians and necessitated plans to give them special public aid in the winter.

Officers. Arizona's chief officers, serving in 1939, were: Governor, Robert T. Jones (Dem.); Secretary of State, Harry M. Moore; Treasurer, William Petersen; Auditor, Ana Frohmiller; Attorney-General, Joe Conway; Superintendent of Public Instruction, H. E. Hendrix.

ARIZONA, UNIVERSITY OF. A coeducational State institution of higher learning in Tucson, Ariz., founded in 1855. The 1939 autumn enrollment totaled 2666, of whom 1757 were men and 909 women; the registration for the summer session of 1939 was 857, of whom 471 were men and 386 women. The faculty numbered 213. The income for 1938-39 was \$1,907,136 and the amount of endowment \$48,136. The library contained 131,365 volumes. The construction of the new Douglas Memorial Mining and Metallurgical Building, the gift of the Phelps-Dodge Corporation, was begun in September, 1939. President, Alfred Atkinson, D.Sc.

ARKANSAS. Area and Population. Area, 53,335 square miles; included (1930) water, 810 square miles. Population: Apr. 1, 1930 (census), 1,854,482; July 1, 1937 (Federal estimate), 2,048,000; 1920 (census), 1,752,204. Little Rock, the capital, had (1930) 81,679 inhabitants.

Agriculture. Arkansas harvested, in 1939, 6,093,000 acres of principal crops: about 8 per cent less than the average for the decade 1928-37. Cotton, on 2,125,000 acres, made 1,410,000 bales (\$62,040,000 in estimated value on the farm); corn, on 2,085,000 acres, 32,318,000 bushels (\$21,330,000); tame hay, on 991,000 acres, 1,080,000 tons (\$8,532,000); rice, 171,000 acres, 8,721,000 bu. (\$6,628,000); potatoes, 39,000 acres, 3,003,000 bu. (\$2,312,000); sweet potatoes, 40,000 acres, 2,680,000 bu. (\$2,278,000); oats, 132,000 acres, 2,904,000 bu. (\$1,133,000).

Manufacturing. Manufacturing establishments in Arkansas numbered 1048 in 1937; employed 37,280 wage-earners (in 1935, 29,026); paid \$24,734,112 in wages (in 1935, \$17,327,951); and produced goods to the value of \$164,676,277 (in 1935, \$119,340,868), to which sum they contributed by manufacture \$65,587,347 (in 1935, \$45,232,560). The wood-working industries, first in importance, furnished about \$48,000,000 of the total value of manufactured products.

Mineral Production. The moderate recovery in the yearly total of the production of petroleum, made in 1937 after some 12 years of decline, became much sharper thereafter, the annual total

jumping to 18,077,000 barrels (1938) from 11,764,000 for 1937. The increment to the total came chiefly from the Schuler field and in less part from the Rodessa field. Some new discoveries were made in 1938; the Magnolia field, in Columbia County, was judged the most important. The yield of natural gas also increased, jumping to some 20,557 million cu. ft. for 1938, from 12,485 million for 1937. Of 1937's total, the oil wells contributed rather more than gas wells, and 9690 million cu. ft., or the greater part of the year's total, was delivered to consumers; this quantity had a value of \$1,984,000 at the points of consumption, but of only \$637,000 at the wells. The State's moderate production of coal dropped to some 1,192,000 net tons for 1938, from 1,511,000 for 1937. While Arkansas continued to furnish all but a small part of the bauxite (clay used as the source of aluminum) its shipments fell to 293,280 long tons (1938) from 402,105 (1937); in value, to \$1,679,663, from \$2,322,861.

Education. In Arkansas the inhabitants of school age were stated, for 1939, as 635,028. For the academic year 1938-39 enrollments of all pupils in the public schools numbered 362,780 white and 115,544 Negro; in the elementary group (grades 1 to 8) the enrollments amounted to 298,586 white and 109,082 Negro; in high schools (grades 9 to 12), the totals were 64,194 white and 6,462, Negro. Expenditure of the year 1937-38, for public-school education totaled \$15,254,352. Teachers of whites numbered 10,240; teachers of Negroes, 2498.

Legislation. The Legislature held a regular 60-day biennial session, beginning in January. At the recommendation of Governor Bailey it gave the State an act to permit a preferential primary for registering the vote on potential candidates for President; however, as it came from the Legislature, the bill for such a primary raised no vivid likelihood that an actual primary would ever take place, for it required that some intending candidate not only apply for the election, but put up, through a party's State committee, the estimated cost of \$75,000. The prices of automobile and motor-truck licenses were reduced, but the small charge for the driver's license was somewhat increased, to 50 cents. Measures were voted to repeal the enactment of 1937 for a State system of civil service. With a view to furthering the Governor's plans for refunding the State's \$142,000,000 of highway bonds at lower interest, the Legislature appropriated out of the cash balance \$4,000,000, to be used, with subsidiary credit from banks, for the purchase of a considerable quantity of the bonds.

The session enacted a system of workmen's compensation, compulsory on the employer and providing payments in the case of accident, occupational disease or poisoning when connected with the sufferer's employment; Arkansas was the 47th State to adopt workmen's compensation.

In accordance with a constitutional amendment adopted in 1936 and now going into effect the members of the State Senate were divided at the outset of the session, into two groups, one to serve for two and the other for four years; in executive meeting the Senators settled by lot who should hold the 18 seats having an incumbency of 2 years and who should get the 17 seats good for 4 years.

Political and Other Events. Governor Bailey entered his second term on January 10; at his inaugural he recommended the abolition of the

State's system of convict farms, the enactment of a system of workmen's compensation for injury incurred in the course of employment, and the furnishing of free textbooks to pupils in the high schools. Better economic conditions in the State prevailed through the greater part of the year; retail sales, affording an indication of the purchasing power of the population, ran higher than in 1938, the months' totals of the current year generally exceeding those for corresponding months of 1938 by a higher percentage than the average for States reporting such figures. A considerable addition to the system of improved highways was made by the completion, early in the year, of the paving of the State's part of Route 67, the shortest road between Dallas and St. Louis.

Officers. The chief officers of Arkansas, serving in 1939, were: Governor, Carl E. Bailey (Dem.); Lieutenant-Governor, Bob Bailey; Secretary of State, C. G. Hall; Treasurer, Earl Page; Attorney-General, Jack Holt; Land Commissioner, Otis Page; Auditor, J. Oscar Humphrey.

ARKANSAS, UNIVERSITY OF. A coeducational State institution of higher learning in Fayetteville, Ark., founded in 1871, with a School of Medicine in Little Rock. In the fall of 1939 the total enrollment was over 2700 and for the summer session it was 896. The number of faculty members was 215. The endowment amounted to \$132,000, while the income for the year was estimated at \$1,400,000 (including medicine). In addition the University received large sums for work in agricultural extension. The library contained approximately 153,000 volumes. President, J. W. Fulbright, inducted September, 1939.

ARMAMENTS, COST OF. Even before the outbreak of the European War (q.v.) in September, 1939, the rapidly rising cost of world armaments had aroused widespread concern. The Bank for International Settlements at Basle, Switzerland, on May 12, 1939, estimated that the world was spending \$1,000,000,000 each month on armaments and that the total cost in 1938 was six times greater than in 1928. In a report presented to the International Chamber of Commerce in Copenhagen on June 27, Louis Marlio estimated the combined armament bills of Germany, Great Britain, France, Italy, and Japan for 1938 at \$12,000,000,000. John G. Winant, director of the

history. These armament expenditures were only a fraction of total national defense costs.

Speculation as to the extent of German armament costs, which were not made public after 1934-35, was set at rest to some extent by Chancellor Hitler's speech to the Reichstag on September 1, when his armies were marching into Poland. He then announced that his government had spent 90,000,000,000 marks (about \$36,000,000,000) on arms and military preparations of all kinds since it was established in January, 1933. (Italy spent \$6,930,612,000 for arms since 1922.) In 1937 German armament costs were estimated at about 15 per cent of the national income, as compared with about 11 per cent for France, 6.6 per cent for Britain, and 1.4 per cent for the United States. French national defense costs for 1939 were estimated before the outbreak of war at about 40,000,000,000 francs, or more than 40 per cent of the budget.

After the outbreak of war, all of the great powers and many of the smaller countries greatly increased their armament expenditures. At the beginning of November the *London Economist* estimated Great Britain's annual war outlay at £4,200,000,000, as compared with £2,696,000,000 in the fiscal year 1917-18. In July, 1939, before the war began the Chancellor of the Exchequer placed defense costs for the year at £730,000,000 out of a total national income estimated at £6,000,000,000. Regular and emergency national defense appropriations in the United States budget increased from \$1,139,878,687 in 1938-39 to \$1,519,458,388 in 1939-40 and to an estimated \$1,839,769,860 in 1940-41. Including all projects and activities of a military or semi-military nature, the defense bill for 1940-41 was estimated at more than \$2,000,000,000. See PUBLIC FINANCE.

In his I.L.O. report cited above, Mr. Winant warned that "rearmament cannot continue at the present rate of acceleration without eventually absorbing so much of the national income of many countries as will prove intolerable." He predicted that it would cause "actual starvation in the lower income groups." The Economic Committee of the League of Nations, in its report to the Council published July 4, admitted that heavy armament expenditures might in some cases have an immediate beneficial effect through wider distribution of purchasing power. But it held that

* Information not available.

International Labor Organization, in his annual report made public May 30, 1939, estimated the world's annual armament bill at \$16,000,000,000. An estimate at the year end placed this total at \$20,000,000,000.

The accompanying table from the League of Nations *Armaments Year Book* shows the expenditure on armaments of the chief world powers after the establishment of the National Socialist regime in Germany in January, 1933, inaugurated the most costly armaments race in the world's

the expenditures, if continued, must inevitably lower the living standard of the populations concerned. The Committee also emphasized the difficulties certain to arise in making the transition back from a wartime economy to a peacetime basis when the limitation of armaments again became feasible.

ARMENIAN APOSTOLIC CHURCH IN AMERICA. See RELIGIOUS ORGANIZATIONS.

ARMENIAN SOVIET SOCIALIST REPUBLIC. One of the 11 constituent republics of the U.S.S.R., on the southwestern border between the Black and Caspian Seas. Area, 11,580 square miles; population (Jan. 17, 1939), 2,281,599. Erivan, the capital, had 150,000 inhabitants. In 1937 the area under cultivation was 1,079,000 acres and 90 per cent of the farms had been collectivized. Cotton, wheat, barley, oats, and grapes were the main agricultural products. There are plants engaged in manufacturing chemicals, cement, soap, clothing, boots and shoes, silk, flour, leather, and synthetic rubber. Many hydro-electric stations have been built. In the Lake Sevan hydro-electric development consisting of 9 stations along the 60-mile descent of the Zanga River with a total capacity of 500,000 kilowatts, the station at Kanakir (capacity 88,000 kw in 1939) has been completed and another station (capacity 144,000 kw) is under construction. See UNION OF SOVIET SOCIALIST REPUBLICS.

ARMY AIR CORPS. See AERONAUTICS.

AROSEMENA, JUAN DEMÓSTENES. President of Panama, died at Penonomé, Panama, Dec. 15, 1939. Born in 1879, he was educated at Santa Familia School and at Padres Escolapios College. He worked in Ecuador as a confidential clerk for a company building a railway from Guayaquil to Quito until 1903 when he returned to Panama. He entered political life and served in minor positions in the ministries of War and Navy and in Public Instruction and Justice. In 1906 he served as secretary of the National Assembly and of the Supreme Court of Justice and two years later became a High Court Judge. He represented his government at the Madrid Postal Congress in 1920, and was governor of Colón province during 1922. His first cabinet position came in 1928 when he became minister of Agriculture and Public Works and Foreign Minister, in the cabinet of his brother F. H. Arosemena. He was out of office in 1930, but two years later was reappointed foreign minister in the cabinet of President Arias. In 1935 he assumed the ministries of Development and Public Works and Government and Justice. He resigned in 1936 to run for president as the coalition candidate of the National Revolutionary, National Liberal, and Conservative parties.

Elected the 16th president of Panama at the elections of June 7, 1936 for a four-year term, Dr. Arosemena was inaugurated on October 1. During his regime he worked for the ratification of revised treaties between the United States and Panama, in which he was successful in July, 1939, winning for Panama joint responsibility with the United States for maintaining the safety of the Panama Canal (see PANAMA under *History*); advocated the extension of the government's free trade policy, and the promotion of agriculture; and worked on the reorganization of the municipal courts. In 1938 he announced to the National Assembly that he had drafted a new Constitution for its consideration. An ardent advocate of solidarity among the American republics, President Arosemena was host to representatives of the 21 American republics at Panama City in September, 1939, to discuss the effects of the European War on the Western Hemisphere. After the adoption of the Declaration of Panama he was selected to serve formal notification to the belligerents of the establishment of a neutral safety zone around the

Americas. See NEUTRALITY; PAN-AMERICANISM.

During the course of his career, Dr. Arosemena had served as professor of geography in University College (1908-10); was co-founder of *La Palabra*; edited *Diario de Panamá* (1914); was Panamanian delegate to the League of Nations (1939), and chief delegate to the Pan-American Conference at Montevideo (1933). He was a grand commander of the French Legion of Honor and a commander of the Order of Isabel of Spain.

ART EXHIBITIONS. The two great expositions held by San Francisco and New York in 1939 stressed the importance of art, not only through the employment of artists in their creation, but by the character and quality of the exhibitions which were set forth and featured. In the exposition on man-made "Treasure Island," San Francisco Bay, these exhibitions were under one roof, whereas in the Fair on the Flushing Meadows, Greater New York, the works of the Old Masters, and those of contemporary artists were housed in separate buildings.

The collection of "Masterwork of Five Centuries" in San Francisco was assembled by a special committee, headed by Dr. Walter Heil, and appointed by the Exposition Management. Its 181 items were mostly borrowed from national collections in Europe, and included such world-renowned paintings as "The Birth of Venus" by Botticelli and the "Madonna of the Chair" by Raphael. Also of great interest here was an exhibition of art illustrating Pacific Culture consisting of about 1500 specimens, collected in China, Japan, Korea, the Pacific Islands, Ecuador, Peru, Central America, and Mexico. The contemporary art shown was both American and foreign and included, 457 paintings and sculptures reflecting modern trends. Finally, there was an exhibition of Decorative Arts—bookbinding, ceramics, metal work, textiles, etc., 968 examples. The attendance at the art building in San Francisco was larger than at the two buildings in New York, but this may have been because of more diversified interest, the fact that the West Coast Fair opened earlier and so had longer to run, and that such an exhibition as this had never before been held in the western section of the country.

The "Masterpieces of Art" exhibition at the New York World's Fair was organized and financed by a group of public-spirited individuals, profoundly impressed by the educational potentialities of such a display. These "friends of art" erected the building and met all costs, only about half of which were covered by the 440,000 paid admissions. The 446 exhibits, chiefly paintings but also a few works in sculpture, were selected by Dr. William R. Valentiner and lent by Art Museums and private collectors at home and abroad. That the majority of them came, however, from collectors in this country went to show how incalculably rich the United States has become in recent years in the great works of art of the past. Incidentally, the insurance value carried by the Old Master collection in San Francisco was \$20,000,000; that by Masterpieces at the New York Fair, \$30,000,000. Obviously in both instances they were priceless, but this fact and their high valuation created a problem, when, at the close of the expositions, war having broken out in Europe, foreign lenders requested that their loans be indefinitely extended until the hazard of transportation by sea became again nominal. The solution was a division of responsibility among a group of American museums and a pooling of in-

terests. The Italian paintings from both Fairs were sent directly to Chicago where they were exhibited in the Art Institute through December, while the paintings from the North Countries were shown at the same time in Detroit. During this time arrangements were consummated for sending both collections on circuit to other institutions able to display them safely and meet costs. The attendance at the exhibition of Italian paintings in Chicago was enormous, the galleries so crowded at all times that it was difficult to see the pictures.

The exhibition of "American Art Today" at the New York World's Fair was supposed to be a cross section of current production and much emphasis was placed upon the fact that it came from every state in the Union. Its director was Holger Cahill, head of the WPA Art Project, by whom, with the co-operation of regional juries throughout the country, it was selected from 25,000 works submitted. The exhibits consisted of paintings, prints, and sculpture.

Several of the nations which had pavilions of their own at the New York World's Fair set forth notable art exhibitions. France, for example, gave over the whole second floor of her pavilion to a display of five centuries of French history as illustrated by "Five Centuries of French Art." This took the form of 11 period rooms, perfect in appointments, on the walls of which hung famous paintings from the Louvre and other French museums.

Collaborating with the Fair Management, several of the Art Museums in New York set forth, in the summer of 1939, special exhibitions for the benefit of Fair visitors from out-of-town. The Metropolitan Museum of Art exhibited a collection of approximately 300 paintings by American artists illustrating "Life in America" from the 17th to the 20th Century, a most interesting survey, well calculated to engender pride as well as favorably re-establish in memory the much derided "horse and buggy" days. Of the 145 lenders to this exhibition 78 were private individuals. The National Academy of Design, founded in 1825, held from May 8 to July 25 a retrospective exhibition of works by its members, from that of its first president, Samuel F. B. Morse, the inventor, to those by Academicians of today. This display comprised not only paintings and sculpture but prints and architectural design.

"Art in Our Time" was the title of an exhibition which marked the opening of the Museum of Modern Art's new building and the tenth year of its existence, but was also planned for the delectation of visitors to the New York World's Fair. Included with works by the French modernists, which were in greatest abundance, were paintings by such "American old masters" as Homer, Eakins, Ryder, Whistler, and Mary Cassatt. Sculpture was chiefly shown in the garden—a special feature—as well as exhibits of housing, furniture for the modern home, plumbing, folk and child art, moving-picture films, and still photography.

The Pierpont Morgan Library, New York, in contrast, called attention to the art and craft of the past by a special exhibition of finest book bindings, illuminations, hand printing, drawings by the old masters, and engravings, together with a few examples of masterpieces of painting, sculpture, stained glass, tapestries, etc. used to create an intimate and appropriate setting.

The American Academy of Arts and Letters,

New York, opened in May and continued throughout the summer a special exhibition of the work of two deceased members, E. A. Abbey and Childe Hassam.

Among special exhibitions of unusual note held during 1939 that of Flemish Art, shown first in the Worcester Art Museum, Worcester, Mass., and then in the Philadelphia Museum, was outstanding. This exhibition, sponsored by the Belgian-American Educational Foundation, was made up largely of paintings lent by the Belgian Government and brought to the United States solely for the purpose of temporary display in these two cities. It was opened ceremoniously by the Belgian Ambassador in Worcester on February 23 and closed in Philadelphia, April 26. The attendance in Worcester during the first 18 days that it was on view was 64,400.

Under the patronage of the Dutch Government, the Museum of the Rhode Island School of Design, in Providence, set forth in January the most notable exhibition of Dutch paintings of the 17th century shown in America since the Hudson-Fulton Exhibition at the Metropolitan Museum of Art in 1909. The following month the Detroit Institute of Art showed a very fine collection of Dutch Landscape Paintings assembled from American collections, both public and private.

In celebration of the two thousandth anniversary of the birth of Gaius Octavius, the Emperor Augustus, the Metropolitan Museum of Art, in January, 1939, placed on exhibition a collection of sculpture of the Augustan Age. A number of these works were lent by the Louvre, others were drawn from the Museum's own collection and from those of sister institutions in this country.

Under the title "Three Thousand Years of Chinese Jade" an inestimably rich collection of the art of China in this media was exhibited through the generosity of collectors at home and abroad in the Arden Galleries, New York, in January. In these same Galleries, later, a collection of art treasures from the Forbidden City, Peking, was shown. This exhibition, sponsored by Mrs. Chiang Kai-Shek, was in the interest of the Chinese War Orphans Fund.

The most comprehensive exhibition ever assembled of the works of William Blake was held in the Philadelphia Museum, February 11 to March 20. Drawn from public and private collections, chiefly in this country, it included some newly discovered examples. In April, this same Museum held a notable exhibition of engraved portraits by Nanteuil which comprised 230 superlative proofs, bequeathed by Ellis Ames Ballard.

An exhibition illustrating "Expressionism and Related Movements in Art" was held by the Cleveland Museum of Art in February, assembled from various sources. In March, the Museum of Fine Arts, Boston, under the auspices of the Institute of Modern Art of that city, held an exhibition showing the "Sources of Modern Art." An exhibition comprising about 70 works in sculpture by Charles Despiau and Aristide Maillol was also sponsored in Boston by the Institute.

Largely attended and much discussed was a huge exhibition of the works of Pablo Picasso, covering his production during 40 active years, which opened in November and continued to the end of the year in the Museum of Modern Art, New York. A retrospective exhibition of Picasso's French colleague, Georges Braque, exponent of cubism and abstract painting, was held at the

"MADONNA"

By Jan Van Eyck
(Flemish, c 1380-1440)

This painting, valued at \$250,000, was lent by the National Gallery of Victoria, Melbourne, Australia, to the "Masterpieces of Art" Exhibition at the New York World's Fair, 1939

Phillips Memorial Gallery in Washington in December. Also of more than usual significance was an exhibition of "Designs and Models for Mural Paintings and Sculpture for Federal Buildings," held in the Corcoran Gallery of Art at Washington under the auspices of the Division of Fine Arts of the Public Buildings Administration, Federal Works Agency, November 2 to 21. Under the title "Frontiers of American Art," a comprehensive exhibition of paintings, prints, etc., produced under the aegis of the Works Progress Administration was held in the de Young Memorial Museum, San Francisco, during the summer of 1939.

In addition to all these and a special exhibition of works by "Twentieth Century Artists," which featured the reopening of the Whitney Museum of American Art, New York, in September, there were the usual annual or biennial exhibitions held by professional organizations and art institutions all over the country according to custom, at many of which numerous awards in cash prizes, as well as medals, were given—to say nothing of the endless displays held in dealers' galleries and at WPA Art Centers throughout the country—many of which were of considerable note.

During the summer of 1939 several very important exhibitions were held in Europe—to which, incidentally, American Art Museums and private collectors made generous loans. These were: an exhibition of works by "Leonardo da Vinci and His School," held at Milan; one of the works of Paolo Veronese, at Venice, and one of the works of Hans Memling at Bruges. Also during June, July, and August paintings which had been sent from the Prado at Madrid to Switzerland for safety during the Spanish war were exhibited in Geneva—and then returned.

ART MUSEUMS. The number of Art Museums increased in 1939, as well as, in most instances, attendance records; but there was, with but few exceptions, a marked falling-off in individual supporting memberships and in gifts of money applicable to administrative costs. Obviously this may have resulted from various causes, such as the instability of the financial outlook and general world unrest, but it would seem also to indicate a growing feeling on the part of the people that public institutions should be supported from public funds by systematic taxation, probably without thought or realization that taxpayers in the higher brackets are comparatively few and no longer have surplus income to draw on for such benefices.

Partly to compensate for this shrinkage, but more certainly to continue its established program of education in the Arts, the Carnegie Corporation of New York in 1939 made grants totaling \$214,425 to Art Museums, and \$697,150 to Universities, Colleges, Art Institutions, and Schools (to which the Museums are auxiliary) for advancement of knowledge and appreciation in this field. Frederick P. Keppel, President of the Corporation in his annual report called especial attention to the "shift in emphasis from custodial function of the American Museum to its opportunities for educational and other services," which he declared to be "now everywhere an ac-

complished fact." The publication of a three-volume survey of *The Museum in America*, by Laurence Vail Coleman, director of the American Museums Association, was termed by Mr. Keppel "an outstanding event of the year."

The greatest gift to any Art Museum, not only of 1939, but of many preceding years, was that of the Samuel H. Kress Collection of Italian Art to the National Gallery of Art in Washington, announced July 12. This collection, one of the finest of its kind in the world, comprises 375 paintings and 18 works in sculpture from the 13th to the 18th century. Assembled with the utmost care and expert judgment, each item upholds a high standard, fully in accord with that of the works by Italian masters included in the Mellon collection and given to the Nation. The Kress paintings will be turned over to the trustees of the National Gallery of Art when the building now under construction is completed in 1940. At a meeting of the trustees of the National Gallery of Art in July, 1939, Mr. Kress, and also Mr. Joseph Widener of Philadelphia were elected members of the Board.

By the end of the year the exterior of the National Gallery of Art, located on the Mall, in Washington, was practically completed, and work on the interior was started. Meanwhile the administrative staff was wisely augmented, and a large appropriation made by Congress for furnishings, etc.

Under authority of Congress steps were taken in 1939 to secure a plan for a Smithsonian Gallery of Art which will eventually bear the same relation to the National Gallery of Art as the Luxembourg bears to the Louvre. From a vast number of designs submitted, those by Eliel Saarinen were awarded the first prize of \$7000.

On May 10, the Museum of Modern Art, New York, took possession of its new two million dollar building at 11 West 53rd Street, designed on very modernistic lines, by Edward Stone and Philip Goodwin. This building, of structural steel frame, has glass walls, galleries with movable screens, the most up-to-date lighting, is air conditioned and essentially functional. The ceremonies of the formal opening were of a popular nature and broadcasted. Upon this occasion Nelson Rockefeller was installed as president succeeding Mr. Goodyear, and an exhibition entitled "Art in Our Time" was opened. The attendance during the first six weeks after the opening was approximately 90,000.

The Albright Gallery, Buffalo, received in January 1939, from its president, Mr. Seymour H. Knox, a gift of \$100,000 to establish a Room of Contemporary Art to serve as a testing ground of the art of today, with the understanding that works purchased might be resold if, after fair trial, they were not found worthy of permanent preservation.

On January 18, the Metropolitan Museum of Art opened its remodeled Hall of Medieval and Renaissance Armor, which now has a high apse with side aisles and clerestory opening into various minor galleries. The collection which it displays was at the same time enriched by 153 items from the Giulia P. Morosini bequest.

During the summer of 1939 the Whitney Museum of American Art, New York, added four new galleries, incorporated a new lighting system and made other structural changes. At the time of reopening announcement was made that in the eight years of its existence this Museum had

spent \$203,681 for works by contemporary artists—44 works in sculpture, 154 oil paintings, 163 water colors, 85 drawings, and 374 prints.

The Solomon R. Guggenheim collection of non-objective art, to which 400 items were added in 1939, was opened to the public in May at 24 West 54th Street, New York.

On October 16, the Philbrook Art Museum in Tulsa, Oklahoma, was opened. This building, formerly the residence of Mr. and Mrs. Waite Phillips, was so remodelled that it provides 17 galleries. It stands in a 23 acre park and is administered jointly by the South Western Art Association, the University of Tulsa, and the City of Tulsa.

Through the Louise Caldwell Murdock Trust Fund, the Wichita Museum of Art, Wichita, Kansas, purchased eight paintings in 1939 by well known contemporary American painters.

The Art Museum of Portland, Oregon, begun in 1892 with a gift of \$10,000, and at the present time with assets of \$2,550,000, added a new wing at the cost of \$200,000 from the Ella Hirsch Fund—a bequest of \$850,000.

The Art Institute of Chicago opened a new gallery in 1939 for recent accessions. The Philadelphia Museum opened four new galleries for general purposes, and also installed and opened to the public on December 16 the magnificent Louis XVI drawing room from the home of Mrs. Hamilton Rice of New York which, with its contents, is valued at over \$2,500,000.

The Lyman Allyn Museum of New London, Conn., added a wing in 1939, at a cost of \$40,000, to house and display the Palmer collection of 18th century English and American furniture, paintings, silver, and jewelry, bequeathed, together with building costs, by Virginia Palmer.

Among notable gifts to American Art Museums during this year were the sum of \$365,000 to the Rochester Memorial Museum, Rochester, N. Y.; a valuable collection of 54 paintings given to the Museum of Fine Arts, Boston, in memory of Juliana Cheney Edwards by her children; and a bequest of \$400,000 from Mrs. Edith Perry Chapman to the Metropolitan Museum of Art for the purchase of sculpture in bronze.

Several of the leading Art Museums inaugurated in 1939 evening openings, in order to extend the privilege of attendance to working men and women not free during day-light hours. Also in several instances Art Museums made liberal use of the radio to extend their educational programs and reach a wider public.

On Sunday afternoon June 1, 1939, a tiny little painting on a wooden panel, "L'Indifférent" by Watteau, valued at approximately \$80,000, was stolen from the Louvre. A few weeks later the thief himself, a young man who had been doing some work in the galleries wherein it hung, took it to Police headquarters and explained that he had taken it to restore it. The value of the "restorations" was gravely questioned by Louvre officials, but with its return the episode was considered closed.

LEILA MECHLIN.

ARTS, THE AMERICAN FEDERATION OF. A national art organization formed at a convention of representatives of local art museums and associated in Washington, in May, 1909. Its purpose was to unify art interests throughout the country, to provide a channel for the expression of public opinion in matters relating to art, to in-

fluence legislation, to increase interest in and appreciation of art, and bring about a better understanding in everyday life.

The Federation has 500 chapters comprising a membership of more than 325,000 and an individual membership of between 4000 and 5000. It publishes the *Magazine of Art* and also the *American Art Annual* and *Who's Who in American Art*.

The officers were president, Robert Woods Bliss; vice-presidents, George Hewitt Myers, Olin Dows, Grace L. McCann Morley; treasurer, Lawrence M. C. Smith; secretary, Thomas C. Parker, and manager, L. B. Houff, Jr. Headquarters are in the Barr Building, Washington, D. C.

ART SALES. The highest prices brought by paintings in American auction rooms in 1939 were recorded at the sale of the collection of M. Felix Lachovskii, of Paris, conducted by the American Art Association—Anderson Galleries, New York, on the evening of April 20. These were \$83,000 given for "The Descent from the Cross" by Hans Memling, formerly in the Podelvskiedzy in Leningrad, and \$60,000 for "The Madonna of the Pinks" a little wooden panel 11 by 8½ inches in dimensions, by Raphael, one time in the collection of the Orloff family of Russia. This was the first time that a painting by Raphael had ever been sold at auction in this country. Both purchases were made by private collectors. The total for this sale alone was \$197,175.

The sum of \$393,796 was realized by the sale of five parts of the William Randolph Hearst Collection, in the Parke-Bernet Galleries, New York, but no records were broken. At one of these sales a portrait of Louis XVIII as Dauphin brought \$13,500 and a portrait of Lady Frances Warren by Reynolds \$10,500.

At the Barry-Hayes-Hepburn sale, conducted by the American Art Association-Anderson Galleries, a portrait of Commodore Barry by Gilbert Stuart sold for \$30,000.

A record was established at the sale of the Hewitt collection in New York when \$11,700 was paid for a first folio, in nine volumes, of Audubon's "Birds of America." At the same sale an original painting by Audubon of one of our native birds fetched \$1700, which, compared with what the artist received for such during his lifetime, was large indeed.

High prices were paid in 1939 for works by William Blake, as for instance \$13,000 for his "Europa—A Prophecy" with 17 brilliant plates and frontispiece "The Creation." His "Songs of Innocence" brought \$9000 at public sale in this country and his "Marriage of Heaven and Hell" \$8800. Dr. Rosenbach was the purchaser of the latter. At Christie's, in London, during the season preceding the outbreak of war, 17 wood blocks, the only ones Blake ever cut, were purchased from the National Art Collections Fund for \$2520. These illustrated Thornton's "Pastorals of Virgil." The British Nation also acquired at the same time a pencil drawing thought to be of "St. John on Patmos" for \$787. Another drawing, "The Infant Christ Praying, with Angels," was purchased by a private collector for \$3150.

An extraordinary price—\$13,500—was paid at an auction in New York for a painting by an unknown artist of "Wall Street in 1820" painted from the corner of Broad Street looking toward Trinity Church, Broadway. At this sale, another historical painting of New York, "View from

Provost and Chapel Streets after the Great Fire," was purchased by the Museum of the City of New York for \$1000.

On the whole there was a drop in prices for works by established masters which found their way to the New York auction rooms in 1939 as indicated by the following figures. Topping the list, with the exceptions already noted, was a "Holy Family with Dove" by Rubens which brought \$12,000; next came a "Portrait of a Scholar" by Frans Hals which sold for \$11,000, after which there was a decided decline. A painting by Corot of "Richmond on the Thames" changed hands for \$1800, a "Beach Scene" by Boudin for \$1150, and a small but important portrait by Sargent at only \$1000.

On the other hand it was reported in July that Rembrandt's "St. John the Evangelist" had been purchased by the Museum of Fine Arts, Boston, at private sale, from the Ringling Museum, Sarasota, for \$85,000. Other noteworthy purchases were: "Madonna and Child" by Verrochio, by Samuel H. Kress from the Clarence Mackay collection, (which in June was placed on private sale with Jacques Seligmann & Co.), and of a French Gothic tapestry from the same collection by the Metropolitan Museum of Art. In these instances the prices paid were not made public.

The outstanding sale of the early winter of 1939-40 was that of the collection assembled by Mrs. Cornelius J. Sullivan, of New York, by Parke-Bernet Galleries, at which a portrait by Cezanne of his wife sold for \$27,500 to a private collector; a portrait of Mlle. Ravoux, by van Gogh, brought \$19,000, and a painting, "Femme dans le Jardin de M. Forest" by Toulouse Lautrec, \$5700. These prices, however, were not comparable to that paid by an American collector for a "Self Portrait" by van Gogh, sold at Lucerne, Switzerland, in the summer of 1939 in a collection of "degenerate art" officially exiled from Germany, which was 175,000 Swiss francs, approximately \$39,000.

A record price was also paid by an American firm for a painting by Whistler in London. This was his well known and highly esteemed "At the Piano," shown at the Royal Academy in 1860, which brought £6405, or over \$32,000. Whistler himself sold it originally for £30.

At Christie's on July 14th an oak panel, "A Hilly River Scene with the Flight into Egypt," (definitely authenticated as the work of Peter Bruegel the Elder, sold for £8190 (the highest price of the year in these sales rooms). A retired British Admiral had picked it up at a country auction a couple of years back for £10 and sold it to the owner of Bladon Castle, Mr. Holbrooke, for £700, after whose death it was offered as a gift to the National Gallery of Scotland and declined, the identity of the artist not having then been established.

A record price was set for a Goya, when, at an auction at Southby's £6800 was paid for his portrait of the Spanish actress, "Dona Antonia Zarat." At the same sale a "St. Catherine" by El Greco brought £3800.

LEILA MECHLIN.

ASBESTOS. The Canadian industry, which accounts for 60 per cent of the world's production of asbestos, worked at full capacity in 1939 on account of war demand and increased consumption in the United States. According to preliminary estimates by the Dominion Bureau of Statistics,

Canadian production in 1939 was 353,151 tons, valued at \$15,454,000, compared with 1938 production of 289,793 tons valued at \$12,890,195. Asbestos is the most important non-metallic mineral produced in Canada (fuels excepted). In 1939 the production was valued at more than half the total of all non-metallics. With the exception of a small production in Ontario, all of Canada's asbestos comes from the Eastern Townships of Quebec.

During the first nine months of 1939 the Asbestos Corporation, Ltd., exported from Quebec 118,654 tons of asbestos valued at \$7,690,565. Exports for this period to the United States were 38,147 tons; to Japan 19,602.

Russia is the second largest producer of asbestos, with Southern Rhodesia third.

Prices of asbestos vary widely according to grade and industrial use. In December 1939, No. 1 crudes commanded the following prices per ton; Quebec, f.o.b. mines, \$700 to \$750; Rhodesian, c.i.f. New York, \$300; Russian, c.i.f. New York, \$275.

The United States produces only a modest quantity of asbestos from mines in Arizona, California, Maryland, Montana, Vermont, and Wyoming. According to *Minerals Yearbook*, 1939, of the Bureau of Mines, the domestic industry offers little promise of large expansion.

ASTRONOMY. D. B. McLaughlin has completed an interesting study on the light curves of novae. He calls attention to the widespread belief that typical novae are very rapid in their changes. As a matter of fact, the light curve from the beginning of the rapid increase of light till the light recedes to its initial value varies greatly, and some attempt at classifying them is therefore in order. Some years ago Gerasimovic gave a classification of novae based on their light curves, in which he recognized: I. Slow Novae with subheadings (a) permanent, (b) semi-permanent, (c) proper slow novae, (d) slow with sudden decline. II. Flashing Novae with subheadings (a) flashing novae proper, (b) flashing with rapid fall and partial recovery. McLaughlin uses this classification too, but emphasizes that there is no sharp line of demarcation between classes I and II. McLaughlin lists 85 stars, which include every undoubted nova recorded since 1572 that occurred in our galaxy. He states that there is an element of doubt about four or five in this list and that there are still other doubtful cases, and the total doubted and undoubted are about 110.

Typical fast novae were Nova Persei, 1901, Nova Geminorum, 1912, Nova Aquilae, 1918, Nova Cygni, 1920, and Nova Lacertae, 1936. Each light curve of these novae has just one

principal maximum of light immediately after the steep rise from minimum. On the descending branch of the light curve all show strong upward concavity and moreover all but one exhibited strong fluctuations of light during the decline.

Typical slow novae were Nova Circini, 1906, Nova Scorpii, 1906, Nova Sagittarii, 1910, Nova Pictoris, 1925, and Nova Herculis, 1934. It appears that the slow novae have a very rapid increase in the light emitted by them but the light curve declines much more slowly. The tendency of slow novae to fluctuate irregularly during the early part of the decline is particularly marked.

McLaughlin points out several distinct stages of light variation of a typical nova. The stages he recognizes are: (1) Pre-nova stage, when the star is either constant or irregularly variable through a small range; (2) the initial rise, that portion of the light curve from minimum to within two magnitudes of maximum; (3) pre-maximum halt, where the initial rise is followed by a marked pause or even a decrease; (4) the final rise, when the light curve increases much more slowly than in the initial rise; (5) maximum of light, of brief duration; (6) the early decline, extending from the maximum to within three to four magnitudes of the minimum; (7) the transition; (8) the final decline, when whatever oscillations present are slow and irregular, and (9) the post-nova stage, when the star has receded to its original state. The seventh or transition stage is of three fairly well marked forms (a) a series of strong oscillations, (b) a single broad minimum followed by a recovery of light, and (c) an abrupt change of the curve toward a gentler slope.

Observations for any one nova are not detailed, and this is especially true in the initial stages. McLaughlin lists all novae for which observations are available, according to the stage of the light curve. The average range of magnitude for novae is found to be very close to 10 magnitudes. The rates of decline show a broad and practically continuous distribution and little bunching. The rate of decline is two magnitudes in about 40 days or three magnitudes in 70 days. Arranging novae according to rates of decline shows that slow novae are quite numerous and that there is no true demarcation between fast and slow novae.

McLaughlin points out the need of more accurate light curves and emphasizes the importance that recent and future novae be followed closely throughout the course of their variations.

The McDonald Observatory, located on Mount Locke in the Jefferson Davis Mountains, Tex., was dedicated on May 5, 1939. This observatory was made possible by a bequest of the late William J. McDonald. It has an 82-inch telescope, the second largest in the world, the largest being the 100-inch at Mount Wilson, Calif. (The 200-inch telescope is not yet complete.)

December 4 marked the three-hundredth anniversary of the first observation of the transit of Venus across the sun's disc by Jeremiah Horrocks and William Crabtree. This anniversary was appropriately celebrated.

Phenomena. There were four eclipses in 1939, two of the sun and two of the moon. The first solar eclipse was an annular one visible in the North Polar regions, and the second solar eclipse, although total, was visible only in the South Polar regions. Hence these eclipses excited little popular interest and yielded no observations of scientific value.

The year was very unusual for the observations of comets; 12 were observed as follows:

Comet 1939a. A new comet independently discovered on January 19 by the Russian Kosik and the American Peltier. Its orbit lies wholly inside that of the earth's, though its inclination is very high, viz., 63° .

Comet 1939b. A second new comet was discovered by Väisälä of Finland on February 8. Later observations showed it to be a periodic comet with a period of about 10 years.

Comet 1939c. Pons-Winnecke. This comet was expected to return and was first observed this year on March 17. The Pons-Winnecke is one of the most famous comets, being first discovered by Pons in 1819. Winnecke found it again in 1858, and established that it was the same comet as Pons reported in 1819. Notable changes have taken place in the orbit of this comet since its discovery in 1819. Both the period and the distance from the sun at nearest approach have increased. In 1819 the latter distance was 72,000,000 miles; in 1898 it was 86,000,000 miles; and in 1915 it reached the orbit of the earth. At this comet's return in 1915 its distance from the sun at nearest approach was 3,000,000 miles *outside* the earth's orbit. In 1927 this comet approached the earth within 3,500,000 miles, which is, with one exception (that of Lexell's comet in 1770), the closest approach on record. Between 1927 and 1933 the orbit of Pons-Winnecke moved out 6,000,000 miles more, so that there will be no more close approaches of this comet to the earth. The period of comet Pons-Winnecke is now about half that of the planet Jupiter. In 1942 this comet will approach Jupiter so closely that further changes in its orbit are to be expected.

Comet 1939d. On April 15 a new comet, the third new comet of the year and a very bright one, being of the third magnitude and hence visible to the naked eye, was independently discovered by two Russian amateurs Achmarof and Balesino. Further independent early discoveries were made by no fewer than six other observers. Such a large number of discoveries was to be expected, due to this comet's brightness. It would be impractical to attach so many names to the designation of this comet, and the central bureau of the International Astronomical Union at Copenhagen has decided in such cases to limit the names to three. This comet will therefore be called *Jurlof-Achmarof-Hassel (1939d)*. The comet showed a large round coma with diffuse edges and a bright central nucleus, and there was a conspicuous tail about 20° long. Computations show a nearly parabolic orbit so that its period must be very large, retrograde motion, a perihelion passage on April 10 at a distance from the sun of about one-half an astronomical unit.

Comet 1939e. Kopff. The expected return of this comet was first observed on April 22 by Van Biesbroeck at the Yerkes Observatory. This comet has now been observed at four returns since its first discovery by Kopff in Heidelberg in 1906; it has a period of 6.6 years. When the discovery position was compared with the predicted position in the ephemeris published by F. Kepinski, there was shown such a very small error that Kepinski's ephemeris was the most precise prediction of a periodic comet ever made.

Comet 1939f. Schwassmann-Wachmann 1925 II. This expected comet was first observed photographically at Johannesburg by Jackson on June 12. This is the periodic comet that has shown such

exceptional and rapid changes in brightness ever since it was discovered. Its nearly circular orbit brings it in opposition every year, and it has been well followed since its discovery (although it was unobserved in 1938). This comet has a period of about 16 years and will soon have been followed all the way around its orbit.

Comet 1939g. Brooks II. The expected return of this comet was first observed by Adams and Jeffers at the Lick Observatory on June 17. This comet has been quite regularly observed at its returns since it was first observed in 1889.

Comet 1939h. This new comet (the fourth unexpected comet of 1939) was discovered by Rigollet in France on July 28. It is not definite that this is a new comet, since orbits calculated for it show that it may be identical with Caroline Herschel's Comet 1788 II. Moreover a period of about 150 or 151 years satisfies the observations.

Comet 1939i. Tuttle. The expected return of comet Tuttle was first observed by Jeffers on August 12. This is the seventh observed return of this comet since its discovery by Méchain in 1790. It was not reobserved until it was found independently by Tuttle at the Harvard College Observatory in 1858. Since then it has been followed at each successive return, indicating a period of 13.6 years.

Comet 1939j. Giacobini-Zinner. The expected return of this comet was first seen by Van Biesbroeck at the Yerkes Observatory on October 14. This comet was discovered by Giacobini in France in 1900 and showed a period of 6.5 years. In 1907 conditions were unfavorable and it was unobserved. In 1913 it was independently found by Zinner. Its next return (1920) was again missed, but it was seen in both 1926 and 1933.

Comet 1939k. The expected return of periodic comet Faye was first photographed by Jeffers at the Lick Observatory on November 3. This is the tenth return of this comet to be observed since its discovery by Faye at Paris in 1843. It has a period of about 7.5 years and two of its returns (those of 1903 and 1918) were unobserved.

Comet 1939l. A new comet (the fourth definitely new comet and the fifth unexpected one of the year) was discovered at Escondido, California, by Friend on November 4. The period of this comet has not yet been announced.

In addition to the twelve comets just listed, a comet was announced by Kaminsky at Tashkent (Siberia) on July 24. On August 1 Fresa at Turin, Italy, apparently confirmed this reported comet discovery. However, this comet could not be located by the astronomers at the Yerkes, Lick, and Harvard College observatories. No further information has become available about this questionable object, and so it has been omitted from the above list.

The returns of two other comets were expected in 1939, but were not observed. These were the comets Borrelly and Wolf II. Comet Borrelly was due to pass perihelion at the end of June but was unfavorably situated with respect to the sun. The location of Wolf II is quite uncertain owing to large perturbations by Jupiter, though it was due to come to perihelion in December.

On the night of July 11 a very bright meteor crossed southwestern Ontario and was seen by a large number of people in that region. Several small scattered pieces of meteorite and one large 88 lb. body were recovered near Dresden, Ontario. It is unusual to recover so large a meteorite whose flight has been observed. The

fall of the meteorite was accompanied by noises variously described as resembling fire of guns and thunder. The meteorite is now deposited with the University of Western Ontario at London.

AUSTRALIA. A self-governing dominion of the British Commonwealth of Nations. Capital, Canberra.

Area and Population. The area of the six States and two Territories, the census population of June 30, 1933, and the estimated population on Mar. 31, 1939, exclusive of aborigines, are shown in the accompanying table.

AREA AND POPULATION OF AUSTRALIA

| States and Territories | Area in sq. miles | Population | |
|-----------------------------------|-------------------|---------------|---------------|
| | | June 30, 1933 | Mar. 31, 1939 |
| New South Wales..... | 309,432 | 2,600,847 | 2,742,859 |
| Victoria..... | 87,884 | 1,820,261 | 1,880,241 |
| Queensland..... | 670,500 | 947,534 | 1,008,461 |
| South Australia..... | 380,070 | 580,949 | 595,376 |
| Western Australia..... | 975,920 | 438,852 | 463,880 |
| Tasmania..... | 26,215 | 227,599 | 238,061 |
| Northern Territory..... | 523,620 | 4,850 | 5,737 |
| Australian Capital Territory..... | 940 | 8,947 | 11,824 |
| Total..... | 2,974,581 | 6,629,839 | 6,946,439 |

Living births in 1938 numbered 120,415 (17.46 per 1000); deaths, 66,451 (9.64 per 1000); marriages, 62,411 (9.05 per 1000). A total of 77,928 persons arrived in Australia during 1938 and 68,791 departed, the net immigration being 9137. The aggregate estimated increase in population in 1938 was 63,101. Estimated populations of the chief cities, all of them State capitals, on Dec. 31, 1938, were: Sydney, N.S.W., 1,288,720; Melbourne, Victoria, 1,035,600; Brisbane, Queensland, 325,890; Adelaide, South Australia, 321,455; Perth, Western Australia, 220,330; Hobart, Tasmania, 63,150; Canberra, 9740. Newcastle, N.S.W., had 104,485 inhabitants at the 1933 census.

Education and Religion. Elementary education is free and compulsory. Illiteracy is estimated at about 15 per cent of the adult population. Enrollment in 10,307 State (public) schools in 1936 was 906,221; in 1873 private schools, 234,278. The six State universities, located at the respective State capitals, had 10,657 students in 1936. The division of the population by religious affiliation at the 1933 census was: Church of England, 2,565,118; Roman Catholic, 1,161,455; Presbyterian, 713,229; Methodist, 684,022; Catholic (undefined), 127,542.

Production. The estimated gross value of production, by chief industries, for the fiscal years

ended June 30, is shown in the accompanying table from the *Quarterly Summary of Australian Statistics*.

VALUE OF AUSTRALIAN PRODUCTION, YEARS ENDED
JUNE 30TH [*In thousands of pounds sterling*]

| Item | 1936 | 1937 | 1938 |
|----------------------------------|----------|----------|----------|
| Agricultural | £ 75,388 | £ 91,403 | £ 93,229 |
| Pastoral | 91,286 | 105,499 | 100,794 |
| Dairy, poultry, bee-farming... | 47,533 | 49,886 | 57,641 |
| Forestry and fisheries | 11,624 | 11,765 | 14,755 |
| Mining | 23,248 | 27,381 | 32,434 |
| Manufacturing ^a | 155,891 | 170,811 | 188,061 |
| Total | £404,970 | £456,745 | £486,914 |

^a Value added in process of manufacture.

The total area under crops in 1937-38 was 21,951,731 acres. Production of the chief crops in that year was: Wheat, 187,255,673 bu. (about 154,427,090 bu. in 1938-39); oats, 17,165,061 bu.; corn, 6,816,612 bu.; hay, 3,423,753 tons; sugar cane, 5,494,610 tons. Estimated production of cane sugar, 1938, was 810,000 tons. Livestock in 1937 included 113,372,518 sheep (109,379,478 in 1938), 13,078,356 cattle, 1,747,374 horses, and 1,100,082 swine. Wool production (as in the grease) was about 985,000,000 lb. in 1938-39. The value of mineral production in 1938 was £32,420,842 (gold, £14,026,615; silver and lead, £4,744,437; copper, £893,080; tin, £711,628; coal and lignite, £7,539,622). For the year ended June 30, 1938, there were 26,395 manufacturing establishments, with 559,160 employees. Salaries and wages totaled £102,078,550 (exclusive of those of working proprietors), the value of materials used was £287,243,412, and the value added in process of production was £195,488,024.

Foreign Trade. The trend of Australian trade during recent years is shown in the accompanying table. The values are for direct overseas imports and exports, including merchandise, bullion, and specie.

AUSTRALIAN FOREIGN TRADE, YEARS ENDED
JUNE 30TH [*British currency values*]

| | Imports | Exports ^a | Balance |
|----------------------------|--------------|----------------------|--------------|
| 1929-30 | £131,081,320 | £125,127,148 | £- 5,954,172 |
| 1931-32 | 44,712,868 | 85,348,607 | +40,635,739 |
| 1936-37 | 92,640,462 | 129,664,318 | +37,023,856 |
| 1937-38 | 113,975,060 | 125,837,879 | +11,862,819 |
| 1938-39 ^b | 102,232,092 | 111,575,703 | + 9,343,611 |

^a Including re-exports. ^b Preliminary.

In 1938-39 the United Kingdom took 47 per cent of all exports (55 in 1937-38); United States, 14 (7); France, 7; New Zealand, 5; Japan and Belgium, 4 per cent each. Of the imports, the United Kingdom supplied 40 per cent in 1938-39; United States, 14; Canada, 8; Netherlands Indies, 7; Japan and Germany, 4 per cent each. Wool, wheat, butter, lead, gold, and frozen meat are the principal exports. See IMPORTS AND EXPORTS.

Finance. For the fiscal year ended June 30, 1939, receipts of the Consolidated Revenue Fund totaled £95,064,790 (£89,458,154 in 1937-38) and expenditures were £94,437,481 (£85,963,421 in 1937-38), exclusive of expenditures of £3,494,733 in 1938-39 and £1,276,558 in 1937-38 from excess receipts. The Consolidated Revenue Fund receipts and expenditures for 1939-40 were estimated at £101,490,000 and £101,452,000, respectively. In addition expenditures out of loans for defense, etc., amounted to £3,912,000 in 1938-39 and were estimated at £48,931,000 for 1939-40. For defense budgets, see *History*.

The Commonwealth public debt on June 30, 1939, was £397,250,931 and the aggregate debt of the States £897,772,042, making a total of £1,295,022,973, or a per capita debt of £184 2s. 8d. Figures are in Australian pounds (Australian £ averaged \$3.8955 for 1938 and \$3.5338 for 1939).

Transportation. There were 27,186 miles of government railways and 787 miles of privately-owned lines open for traffic on June 30, 1938. Gross earnings of all government lines in 1937-38 were £45,274,000 and working expenses £34,242,000. Highways in 1939 aggregated 485,000 miles (see *ROADS AND STREETS*). The aggregate route mileage of civil airlines on Jan. 1, 1939, was 30,245 and the miles flown per year was 10,604,568. For the year ended June 30, 1938, civil airlines carried 132,917 paying passengers. The number of vessels entering Australian ports directly from overseas was 1905 of 7,128,404 net tons in 1937-38.

Government. Executive power is vested in the King, who acts through a governor-general and a ministry responsible to the Federal Parliament. There is a Senate of 36 members (6 from each State), elected for 6 years and renewed by half every 3 years, and a House of Representatives of 74 members apportioned among the States on a population basis and elected for 3 years. The composition of the House of Representatives following the election of Oct. 23, 1937, was: United Australia Party, 29; Labor, 29; United Country Party, 16. In the Senate the standing was: United Australia Party, 20; Labor, 16. Prime Minister at the beginning of 1939, Joseph Aloysius Lyons (United Australia Party), heading a United Australia-Country Party coalition government formed Nov. 9, 1934, and re-organized Nov. 29, 1937 and Nov. 7, 1938. Governor-General, Brig. Gen. Alexander Hore Arkwright, Baron Gowrie, who assumed office Jan. 22, 1936.

HISTORY

Political Developments. The year 1939 was a momentous one in Australian history. It was marked by the sudden death of Prime Minister Joseph A. Lyons (q.v.), followed by a period of political realignments, and by the unhesitating entrance of the Commonwealth into the European War in support of the mother country.

Even before Mr. Lyons' death, the stability of his government had been threatened by two factors—the growing electoral strength of the opposition Labor party and mounting friction within the coalition cabinet. There had been serious differences between the United Australia party and the Country party as well as dissensions within the former group. These dissensions arose in part over the growing pressure for strengthening Australian national defenses. After the Czecho-Slovak crisis of September, 1938, some members of the government advocated curtailment of expenditures for social insurance to permit heavier expenditures for defense. (See 1938 YEAR BOOK, p. 68, for the defense and social security legislation passed during that year.) When the cabinet finally decided to abandon the contributory pensions provision of the Social Security Law, R. G. Menzies, in protest, resigned as Attorney General, Minister of Industry, and deputy leader of the United Australia party (March 15).

Menzies' withdrawal was a severe blow to the government. Prime Minister Lyons asked William M. Hughes, Minister of External Affairs, to take over the vacated posts pending a reconstruction

of the government. But before this could be carried out, Mr. Lyons died unexpectedly on April 7. The same day a new United Australia-County party government under Sir Earle Page, leader of the Country party, was sworn in to carry on until a new leader of the larger United Australia party was chosen. The United Australia party was split into two factions favoring Menzies and former Prime Minister Stanley M. Bruce, then Australian High Commissioner to London, respectively.

Mr. Bruce's conditions proved unacceptable and the United Australia party on April 18 elected Menzies as its leader. The Country party, opposed to Menzies' stand on social insurance, refused to join a government under his leadership. Moreover on April 20 Sir Earle Page, before resigning as Prime Minister, made a bitter personal attack upon Menzies that caused a hostile reaction against Page both within and without the Country party ranks.

Menzies received assurances of support from some Country party members, but his cabinet, sworn in on April 26, was composed entirely of United Australia party members. Besides himself as Prime Minister and Treasurer, it included: Attorney General and Minister of Industry, W. M. Hughes; Supply and Development, R. G. Casey; Defense, Brig. Gen. G. A. Street; External Affairs, Sir Henry Gullett; Commerce, Senator G. McLeay; Interior and Public Works, Senator H. S. Foll; Postmaster-General and Repatriation, E. J. Harrison; Trade and Customs, J. N. Lawson; Health and Social Services, Sir Frederick Stewart; Vice-President of the Executive Council, Civil Aviation and Assistant Minister of Defense, J. V. Fairbairn; Ministers without Portfolio, J. A. Perkins, P. C. Spender, H. E. Holt, Senator P. A. McBride, Senator H. B. Collett. Six of the ministers were members of the last Lyons Cabinet.

Menzies' Program. In outlining the program of his government on April 26, Prime Minister Menzies declared that the economic, financial and military organization of the Commonwealth's defense forces was its primary consideration. If Britain went to war Australia would join her, but no Australian would be compelled to serve on foreign battlefields. While acting as an integral part of the British Empire, Australia must regard itself as a principal power in the Pacific and maintain its own diplomatic contacts with the Pacific countries. In line with this plan, arrangements were completed late in December for the appointment of Richard Gardiner Casey as Minister to Washington early in 1940. No move to establish the proposed legation in Tokyo was reported up to the end of 1939.

The Menzies Government during May and June proceeded with the £63,000,000 defense program laid down under Prime Minister Lyons. In addition Menzies obtained legislation for setting up a Department of Supply and for a register of Australian manpower. However his effort to proceed with the social insurance scheme met with sharp defeat in June and other government initiatives met parliamentary rebuffs. These rebuffs weakened the government, which controlled only 29 of the 74 seats in the House of Representatives. Only the fact that all of the three parties were anxious to avoid a general election in the face of the increasingly critical European situation prevented the government's overthrow.

War Cabinet Formed. The outbreak of the European War stabilized the governmental situation. The same day Britain declared war on Germany (September 3) Prime Minister Menzies announced Australia's entrance into the conflict. A few days later he invited the other parties to join the United Australia party in forming a national government for the duration of the war. The offer was declined by the Labor party but was accepted conditionally by the Country party on September 13 after Sir Earle Page had resigned the party leadership to facilitate such action. He was succeeded by A. G. Cameron, former Postmaster General.

The Country party failed to reach an agreement with the Prime Minister on the bases of a new coalition, but agreed to support all measures for the defense of the Empire. Accordingly the government continued unchanged except for appointment of Ministers Street, Casey, Hughes, McLeay and Gullett as members of the Prime Minister's war cabinet on September 15. On November 12 a slight reorganization took place. The Prime Minister assumed the additional portfolio of Defense Co-ordination and divided the former Defense Ministry into three Ministries—Army (Brigadier General Street), Air (J. V. Fairbairn), and Navy (Sir Frederick Stewart). Minister of Interior Foll entered the war cabinet and Assistant Treasurer P. C. Spender replaced Menzies as Treasurer.

Military Contribution. Australia entered the European War with an enlarged rearmament and defense program well under way and with an industrial plant and financial resources that were very much larger than in 1914. On the other hand the abandonment of compulsory military training in 1929 left the Commonwealth without the nucleus of trained soldiers available upon the outbreak of the first World War. The voluntary militia, numbering about 35,000 in 1938, had been increased to 78,000 by the beginning of August, 1939. In March the Lyons Cabinet decided to establish a permanent mobile military force of 7500 men, but this plan was abandoned by the Menzies Government in August in favor of a well-trained militia. Despite the initial opposition of the Labor party and other elements, compulsory national registration of men between 15 and 64 years of age was completed by the end of August. On October 20 the Prime Minister announced that compulsory military training would be reintroduced in January, 1940. After three months in camp, conscripts would serve in the militia reserve. The militia force under arms would be maintained at 75,000 men, Mr. Menzies said. It was to be equipped with mechanized artillery and modern armored-car and light tank units.

In addition, enlistments were opened in mid-September for a special force of 20,000 men for service at home or overseas as required. Known as the Sixth Division, this force was placed under the command of Maj. Gen. Sir Thomas A. Blamey. Against the opposition of the Labor party and with a number of government members absent, the House of Representatives on November 29 voted (33 to 28) to send this division to serve with the British forces in France early in 1940. John Curtin, Labor party leader, insisted that Australia's manpower was needed for the defense of the Commonwealth in case Japan entered the war on Germany's side.

The Royal Australian Navy at the beginning of 1939 comprised 5 cruisers, 5 over-age destroyers,

2 modern sloops, a survey ship, and a local defense vessel. Before the outbreak of war 2 additional cruisers, purchased from Great Britain, were added to the fleet and 1 old cruiser was modernized. Under construction in Australia and Britain were 2 sloops, 12 motor torpedo-boats, and 3 local defense vessels. By October the naval personnel had increased from 5000 to 10,000 men. The development of Darwin as a naval, military and air base and of Port Moresby in Papua as a base for cruisers and smaller craft was speeded up. Heavy coast defense works were installed at Sydney, Fremantle and Newcastle, and anti-aircraft guns were placed for the protection of the principal cities and exposed towns.

In May, 1939, the Air Force consisted of 132 first-line planes, exclusive of reserves; a permanent personnel of 3170; and a citizen air force of 245. This force was rapidly expanded to 212 first-line planes through construction in Australia and purchases in the United States and Great Britain. The program, mapped out by a British Air Mission that visited Australia early in 1939, called for the training of 900 new pilots annually. But the joint empire air training agreement reached by Australia, Canada, Great Britain, and New Zealand in Ottawa on December 15 greatly expanded the Australian air program. The Commonwealth was to provide 10,400 pilots and 15,600 observers, wireless operators, and gunners. All were to be completely trained in Australia except a few thousand scheduled to receive advance service training in Canada. The cost of this air program in Australia was estimated at £50,000,000 (Australian) for three years. The first Australian detachment to reach England was a squadron of the Air Force which landed on December 26. Shortly before (on December 20) Air Vice Marshal Stanley J. Goble, chief of the Australian air staff, resigned as "a matter of high personal principle." It was reported that he desired the Australian Air Force units in England and France to retain their separate identity rather than be merged with the Royal Air Force.

In contrast with its World War situation, Australia in 1939 was rapidly equipping itself to supply its military, naval, and air forces with the bulk of their equipment, munitions, and supplies. Under the three-year rearmament program announced in December, 1938, government munitions and arms factories were employing 5892 workers in August. Total national defense costs rose from a low point of £3,200,000 in 1931-32 to £26,000,000 for 1938-39. Previous to the outbreak of war defense expenditures for 1939-40 were estimated at £33,137,000 but a revised budget announced December 2 placed the total at £62,140,000. Defense expenditures for the first year of the World War were £19,600,000.

War Aims. In a statement of Australian war aims on October 17 Prime Minister Menzies indicated that the Commonwealth was fighting primarily because it felt its security bound up with that of the British Empire. Australia would have to mortgage herself for a century if she undertook to cut loose from the Empire and organize her own defenses, he said. He listed the protection of small nations as another objective. Australia was not seeking territorial gains and wanted the Germans to have "the same rights and freedom as ourselves." He expressed the hope that Europe would reconstruct itself after the war on the basis of "true justice and independence," and declared that there "must be some international

outlawry of war to which every world power will subscribe."

Co-operation with Great Britain and the other Dominions in the prosecution of these aims was obtained by sending R. G. Casey, Minister of Supply and Development, to London. Sworn in early in November as a member of the Privy Council, he joined with British officials and other Dominion representatives in co-ordinating the Empire's war efforts.

Economic War Measures. Before the war began the government on August 28 assumed control over overseas exchange transactions and prohibited the export of gold or notes. The National Security Act passed early in September gave the government wide emergency powers in virtually all matters involving the effective prosecution of the war. Under this act the government fixed prices of rents and other necessities, acquired control of the 1939-40 wheat crop, prohibited the export of capital, mobilized all overseas assets of the Commonwealth, and in various other ways extended its control over the economic and financial system. Employers were required to reinstate employees in jobs relinquished for war services when these services were ended.

In accords reached with the Australian Government, Great Britain undertook to purchase Australia's entire wool clip during the war as well as its surplus supplies of butter, cheese, meat, eggs, canned and dried fruits, etc. A government board assumed control over shipping. Wheat was marketed through a compulsory Federal pool. Taxes were boosted to absorb part of the increased cost of defense preparations. Exports and most imports were placed under a licensing system.

Other Events. The appointment of the Duke of Kent to succeed Lord Gowrie as Governor-General of Australia upon the expiration of the latter's term in November, 1939, was withdrawn immediately after the outbreak of war in order that the Duke might assume a naval appointment. Lord Gowrie accordingly continued in office.

After drought and extremely hot weather, the States of Victoria, New South Wales, and South Australia were ravaged by disastrous bush fires during January and February. In Victoria, which was the hardest hit, 67 persons were reported burned to death. Claims for private property destroyed in that State aggregated over £778,000, and 4,000,000 acres of State forests with £8,000,000 worth of millable timber were burned.

On August 15 the Federal Arbitration Court laid down the new principle that 44 hours per week should be the standard working time for Australian industry, instead of 48 hours, as formerly. Acceptance of this rule, however, was held to be up to the employers.

See CANADA and GREAT BRITAIN under *History*; EXPLORATION.

AUSTRALIAN ANTARCTIC TERRITORY. That part of the Antarctic comprising all the islands and territory (with the exception of Adélie Land) south of 60° S. latitude and between 160° E. and 45° E. longitude, placed under the authority of the Commonwealth of Australia by an Imperial Order in Council (Feb. 7, 1933) which came into force by the passing of the Act. No. 8 of 1933 (Commonwealth of Australia).

AUSTRALIAN CAPITAL TERRITORY. The inland area (912 sq. mi.) in southeastern New South Wales (acquired from New South Wales by the Australian government on Jan. 1, 1911)

containing the seat of the Federal government, Canberra (8400 inhabitants in 1937). An additional area (28 sq. mi.) along the coast at Jervis Bay was likewise acquired on Sept. 4, 1915. Total area, 940 square miles; total population (June 30, 1938 census), 11,562. Livestock (1937): 244,378 sheep, 9856 cattle, and 1121 horses. For the fiscal year ended June 30, 1937, revenue amounted to £A864,736 and expenditure to £A1,579,147 (£A averaged \$3.9594 for 1936; \$3.9394 for 1937). Administration is under the control of the Australian Minister for the Interior but certain services are still undertaken by the Department of Health and the Attorney-General's Department. See AUSTRALIA.

AUSTRIA. A former independent state of central Europe, annexed by Germany on Mar. 13, 1938, and transformed into an administrative division of the Third Reich. Capital, Vienna.

Area and Population. Area, 32,369 square miles; population, 6,760,000 (estimated June 30, 1938). The 1934 census populations of the chief cities were: Vienna, 1,874,481; Graz, 152,841; Linz (including Kleinmünchen), 108,970; Innsbruck, 61,005. Living births in 1938 numbered 93,968 (13.9 per 1000); deaths, 94,431 (14); marriages, 85,837 (12.7 per 1000) against 46,359 (6.9 per 1000) in 1937.

Education and Religion. About 1 per cent of the adult population is illiterate. At the 1934 census, 90.57 per cent of the inhabitants were Roman Catholics, 4.38 per cent Protestants, 2.83 per cent (191,481) Jews. Of these Jews, more than 100,000 emigrated from Austria between Mar. 13, 1938, and May 15, 1939. There were reported to have been about 120,000 additional non-professing Jews in Austria at the time of Austro-German union.

Production. Agriculture, manufacturing, mining, and lumbering are the main occupations. Production in 1938 was (metric tons unless otherwise stated): Wheat, 441,100; barley, 302,300; rye, 593,700; oats, 439,100; corn, 200,200; potatoes, 3,260,000; beet sugar, 140,400 (1937-38); beer, 3,372,000 hectoliters (hectoliter equals 26.42 U.S. gal.); rayon (1937), 1000; wood pulp, 383,000; paper and paper boards, 282,000. Output of the chief minerals in 1937 was (in metric tons): Cement, 429,000; crude petroleum and shale oil, 63,000 (1938); lignite, 3,242,000; coal, 230,000; salt, 171,000; manganese ore (metal content), 41,800; iron ore (metal content), 672,000; pig iron and ferro-alloys, 388,000; steel, 657,000; lead (smelter), 10,800. A wide variety of manufactured articles are produced. The tourist trade, formerly an important source of revenue, was confined almost exclusively to Germans in 1939.

Foreign Trade. Excluding trade between Germany and Austria, imports in 1938 were valued at 143,500,000 old U.S. gold dollars; exports, \$86,300,000. Including trade with Germany, imports in 1937 were \$161,100,000; exports, \$134,800,000.

Transportation. There were in 1939 about 3685 miles of railway line and 42,120 miles of automobile roads. Austrian Airlines in 1938 carried 18,000 passengers and reported a total haulage of 434,227 ton-miles.

Government. For Constitution and government before Austro-German union, see 1938 YEAR BOOK, p. 70. After the annexation Chancellor Hitler appointed a German, Josef Buerckel, as Reich Commissioner for Austria, and Dr. Arthur Seyss-Inquart, former Minister of Interior of independent Austria, as Governor of the province.

HISTORY

Progress in Nazification. Immediately after the annexation of Austria in 1938 the full force of Nazi propaganda and of German organizing ability had been directed toward co-ordinating the economic system and the political and social institutions of Austria with those of Germany (see 1938 YEAR BOOK, p. 72-73). But reports of correspondents who visited Austria in 1939 indicated that progress toward Nazification was unexpectedly slow. Vienna and the other Austrian cities appeared singularly unmoved by the nationalistic ritual that proved so potent an appeal in Germany proper.

Despite special concessions made to the Austrians with regard to food and the numerous regulations enforced in the Reich, there was growing discontent and criticism of Nazi methods and results. Efforts to organize Austrian economic activities along German lines aroused the passive resistance and non-co-operation of Austrian Nazis and non-Nazis alike. Among the Austrian workers the introduction of German efficiency methods, the speed-up and overtime, provoked malingering and attempted strikes that were quickly repressed. Many Austrian Nazis who had aided in the overthrow of the Schuschnigg regime were embittered by the virtual monopolization of the better state posts by imported Germans.

Reporting on the accomplishments of the first year of Nazi rule, Reich Commissioner Buerckel stated in March, 1939, that work had been provided for 650,000 unemployed Austrians, chiefly in munitions factories and on public works. Nine thousand workers' homes had been erected, and the mining and lumbering trades greatly expanded to supply the ever-increasing demands of Germany proper. Observers reported that while grumbling was widespread among all Austrian classes, it was greatest among the pre-*Anschluss* Nazis and Pan Germans, the business men and employers generally, and the intellectuals. The lower classes of society complained least and considered themselves benefited, on the whole, by the Nazi regime.

To speed up Nazification measures, Reich Commissioner Buerckel on May 1 added to his duties those of Governor of Austria and Burgomaster of Vienna. This brought all of Austria under more centralized control from Berlin. Meanwhile the Nazi drive against adherents of the former Schuschnigg regime, Monarchists, Social Democrats, Jews, Catholics, and other opposition elements was pushed vigorously. On government orders, caskets containing the bodies of former Premier Seipel and the murdered Chancellor Dollfuss were secretly removed in January from the Seipel-Dollfuss Memorial Church in Vienna to common cemeteries. All Hapsburg properties in Austria were confiscated by the state on March 14. There were repeated arrests and trials of Monarchist sympathizers charged with conspiring against the state; of former officials of the Schuschnigg regime accused of fraud or other crimes; and of Catholic clergy and Social Democratic leaders. On August 9 the *Official Gazette* in Vienna announced the dissolution of hundreds of non-Nazi associations and the confiscation of their properties. It was reported in May that the Jews, suffering greater disabilities in Austria than elsewhere in Germany, were leaving at the rate of 200 a day. After the German conquest of Poland (q.v.), thousands of Austrian Jews were transferred to a Polish reservation. See JEWS; also REFUGEES.

Campaign Against the Church. The Nazi regime also continued its relentless drive against the Roman Catholic Church and other anti-Nazi religious groups. The enormous property holdings of the Catholic Church were gradually transferred to the state by a piecemeal process that avoided the aspect of outright and wholesale confiscation. Many religious schools, convents and monasteries were closed and the buildings taken over for barracks and other military purposes. Large business properties owned by the Church in Vienna were turned over to Nazi officials for administration. By the end of 1939 the bulk of the Church properties throughout Austria were reported to have been secularized.

At the same time steps were taken to subordinate the clergy to the state's authority. A decree of May 10 deprived the Supreme Council of the Protestant Churches of Austria of its official status. On May 12 Catholic authorities were ordered to submit all future changes in personnel of the clergy to the Nazi party for approval. Another decree of the same date placed cremation on the same legal basis as burial. Archbishop Sigismund Waitz of Salzburg, the Catholic Primate of Germany, was ousted on May 30 from his state-owned palace, which was taken over by the Hitler Elite Guards. Early in July Nazi demonstrations and riotous attacks upon Theodor Cardinal Innitzer, Archbishop of Vienna, forced him to abandon a tour of rural districts northwest of Vienna. The state subsidy of 120 marks monthly allowed each Catholic priest was ended on September 1. Thereafter members of the Catholic and other faiths were taxed to maintain their churches and clergy. Early in August the Catholic University at Salzburg was suppressed. See **ROMAN CATHOLIC CHURCH**.

Austria's Attitude Toward War. With the outbreak of war against Poland, France, and Britain early in September both anti-Nazi sentiment and Nazi repressive measures were intensified. One observer reported that Austrian troops were "gay and nonchalant" when called to arms. But in Vienna and other cities additional Monarchist and Social Democratic leaders were arrested on charges of "civil disobedience." Meanwhile Austrian exiles abroad undertook to organize a movement for the restoration of Austrian independence. Prince Ernst Ruediger von Starhemberg, former Vice Chancellor and leader of the disbanded anti-Nazi Austrian Heimwehr, a Fascist militia, sought permission in France to organize an Austrian regiment for service against Germany. Archduke Otto of Hapsburg, pretender to the throne of Austria and Hungary, asked the French and British Governments to permit the formation of at least one division of Austrian royalists and other exiles to fight with the Allied armies. In return he wanted Britain and France to list the independence of Austria as one of their war aims. See **GERMANY**.

AUTHORS' LEAGUE OF AMERICA.

A national organization of authors, dramatists, radio writers, and screen writers. It was founded and incorporated in 1912 for the purpose of procuring adequate copyright legislation, both international and domestic; protecting the rights and property of all those who create copyrightable material; advising all such in the disposal of their productions and obtaining for them prompt remuneration therefor; and disseminating information among them as to their just rights and remedies. The League includes the Dramatists'

Guild, the Authors' Guild, the Radio Writers' Guild, and the Screen Writers' Guild. Closely affiliated with it is the Authors' League Fund, an agency formed by the League to meet its obligations with respect to the care of the sick, the aged, and the unfortunate. The officers for 1939-40 are: President, Elmer Davis; vice-president, Kenyon Nicholson; secretary, Homer Croy; treasurer, Luise Sillcox. Headquarters are at 6 East Thirty-ninth Street, New York City.

AUTOMOBILE ASSOCIATION, THE AMERICAN. An association formed at Chicago, in 1902, to serve as the national organization of nine motor clubs. Today, there are approximately 725 motor clubs and branches, with approximately one million members, affiliated with the A.A.A.

The purposes of the organization are twofold: first, through club co-operation, to provide a nationwide network of service and protection to members wherever they travel; and, second, to work constantly for the improvement of conditions surrounding operation of private passenger cars through legislation, education, and other means.

Through the national organization, a member in one club automatically becomes a member of all other clubs and entitled to all services. Among these are included: routing and touring service with a wide range of maps, directories, last-minute road condition reports, and other travel aids; emergency road service under which breakdowns on the road are taken care of by an A.A.A. garage without charge; a bail bond which protects members against a night in jail when charged with traffic violation; and a wide range of other services that are rapidly becoming nationally standardized.

In its public activities, the A.A.A. has concentrated largely on the provision of better highways, fair and equitable taxation of the motor vehicle, a broad-gauged program of traffic safety, the seeking of uniform and well-planned traffic laws, and freedom of travel between the States. It was an early leader in the Good Roads Movement, which resulted in establishment of the principle of Federal-aid for highways, and which has brought about the building of one million miles of surfaced highways. The A.A.A. sponsored the Glidden Tours back at the turn of the century, which did much to prove to the public at large that the automobile afforded a reliable means of transportation.

The A.A.A. maintains a Foreign Travel Division which, up to the time of the outbreak of war in Europe, handled 70 per cent of all cars shipped abroad for foreign vacationing. Through its affiliation with the two international travel organizations, the International Association of Recognized Automobile Clubs and the International Touring Alliance, the A.A.A. can provide its members with motor club service throughout the world.

The A.A.A.'s Contest Board is the internationally-recognized governing body of racing in the United States, and in addition to sanctioning automobile races, it times speed trials such as those on the Bonneville Salt Beds, and makes official tests of automobiles and automobile products.

At its recent meeting in Washington, D. C., the A.A.A. adopted a broad-gauged program of action including: efforts to wipe out abuses in the field of automobile financing; removal of jurisdiction of fee-splitting enforcement officers over the high-

ways through setting up minor court systems; provision of adequate rights-of-way for future highway development through a new land-acquisition program; further efforts to solve the problem created by lack of adequate parking facilities in urban districts; and reduction of pedestrian fatalities. Its basic principles are set forth in the "Bill of Rights for Motorists," adopted in 1937.

The officers for 1939-40 were: President, Thomas P. Henry, Detroit, Mich.; vice-presidents, John H. Wright, Jamestown, N. Y., John R. Bentley, Cleveland, Ohio, John A. Rupp, Allentown, Pa., R. R. Reynolds, Asheville, N. C., Sam W. Burchiel, Providence, R. I., Arthur H. Breed, Oakland, Calif., and Dai H. Lewis, Buffalo, N. Y.; secretary, John L. Young, Cleveland, Ohio; treasurer, Corcoran Thom, Washington, D. C. Headquarters are at Pennsylvania Avenue and 17th Street, Washington, D. C.

AUTOMOBILE RACING. See SPORTS.

AUTOMOBILES. In the manufacture, sale, servicing, and use of motor vehicles 1939 was a very satisfactory year, though few records were broken. Car and truck makers produced more than they anticipated; dealers' stocks of both new and used cars moved comfortably; service business was good, as indicated by increased use of motor transportation reflected in total registrations and gasoline consumption, both reaching new highs; users had available to them the best vehicles yet offered; new legislation was more kindly in its restrictions and control, and driving was much improved, partly by better regulation and largely by greater voluntary attention to safe requirements. Accidents in proportion to miles travelled were the lowest since traffic accident records have been kept.

From the beginning of the motor industry, which was born with the 20th century, vehicle production steadily increased until 1917. From then until the depression, the progression followed a three-year cycle of a drop, a recovery, and an advance. The next drop, 1930 continued for three years and recovery took five years until 1937 (not quite reaching 1929 however) and there was no advance, 1938 marking another drop. If the cycle has been resumed, as the 1939 records seem to indicate, the predicted production of 4,500,000 units in 1940 seems reasonable and likely to be exceeded because the 3,500,000 forecast for 1939 was exceeded by over 200,000.

The war in Europe and any further labor disturbances are factors that will have a bearing. The net of the war's effect last year is rather indeterminable. It undoubtedly increased truck exports, and while passenger-car exports to beligerent countries ceased, they increased to neutral countries; all other car producing countries (except Italy) being at war, were out of the foreign markets. But for strikes at the end of 1939, production would have much further exceeded the predicted three and a half million. The strike in the Chrysler plants made some 50,000 workers idle. (See LABOR CONDITIONS.)

For the fourth consecutive year the National Automobile Show was held in the late fall (two weeks earlier than ever—October 15 to 22) instead of the forepart of the succeeding January. The change in custom was initiated in 1935 in the hope that offering new models before winter had set in would stimulate new car buying and create more factory employment when idleness was most distressing. The experiment was successful in its benefits to labor, but dealers have not been so

well pleased. While they sold more new cars at an earlier season, the used cars that they took in trade had nothing to stimulate their earlier resale, consequently dealer capital was tied up in them until they moved under the normal spring demand. This has proved such a serious handicap to dealers that most are clamoring for a return of show time and new model announcements to January. Thus far manufacturers have resisted this pressure feeling that improved employment stabilization was too important to be sacrificed, hoping perhaps that in time dealers will become adjusted to the new order or that other means may be found for their relief.

Few new models were announced much before the show opened, which contributed to the show's interest and greatly increased attendance. In appearance, as always, new models were changed, but for years it has been increasingly difficult to enhance their good looks. To an even greater extent it appears to be hard to make outstanding mechanical improvements. The most striking innovation in the 1940 models was an industry effort and so found on nearly all makes, the new Sealed-Beam headlights. For two years lamp and car makers had been co-operating in this development to make night driving safer, and motor-vehicle administrators and others active in traffic safety lent their support. It combines in one sealed unit filaments, reflector, and lens. The focus, being fixed, is unalterable by accident or intention, leaving nothing in installing it but proper pointing. This is easily effected by adjusting the lamp's aim with reference to a target set up in specified relation to the car. The cost of the unit has been brought so low that its replacement, when a filament burns out, is not too much more expensive than a new bulb. The reflector being sealed from atmospheric influence and of a non-deteriorating character is never itself the cause of replacement, but a broken or scratched lens may require renewal. The candlepower is higher than former normals and the pattern of beam is projected so as to give the maximum of road and right-shoulder illumination without offensive glare to approaching drivers when the "traffic beam" is in use. The "country beam" throws a better light to a greater distance than former lamps but is intended for use when no vehicles are approaching.

Another improved safety feature common to most new models was use of a new Hi-Test safety glass. It has a new plastic for the lamination between the two sheets of glass which is several times as strong at low temperatures as that formerly used. It may be had with sheet or polished plate glass, the latter being preferred as giving no distortion to objects viewed through it. (See also GLASS.)

Generally speaking, bodies on the new cars were longer, wider, and lower and had greater glass area for better visibility. Much attention was given to improved riding qualities and easier steering. Mechanical gear-shift controls mounted under the steering wheel were practically universal standard equipment. A departure first noted in the 1939 models was very generally applied in the 1940 cars, where heaters are ordered as extra factory equipment—the combination of ventilation with heating, by taking fresh air from outside instead of recirculating air within. A definite trend was in the locating of heaters under the front seat to warm the front and rear compartments more equally.

Also, not new, but more widely adopted were

foam-rubber seat-pads, independent front-wheel springing (Hudson and Nash were the latest to abandon solid front axles), plating or super-finishing engine cylinder or piston surfaces, supplying oil filters as standard equipment, and overdrives as standard or optional. An improved design of overdrive goes into action at a lower speed (20 miles an hour), but is under such control that its engagement can be delayed or direct-drive resumed at any speed.

The fluid-drive, introduced on the 1939 Chrysler Custom Imperial, was added to a few more Chrysler models as optional equipment, but other lines appeared not quite ready to adopt it. Oldsmobile did incorporate a fluid-coupling as an improvement to its four-speed automatic transmission which was continued as optional equipment. Willys adoption of hydraulic brakes leaves almost no standard-sized car not so equipped.

Power plants were improved, but in only one instance completely redesigned. Where power was increased it was not by larger cylinder dimensions but by using higher compression cylinder-heads or improved manifolding or valve design. The only entirely new engine was in the Packard Custom Eight which replaced the Packard Twelve. This leaves the Lincoln and the Zephyr as the last of the 12-cylinder cars. Cadillac still has a 16-cylinder line, but an insignificant number are sold. Apparently most purchasers of even the highest priced cars consider eight cylinders sufficient.

Running boards are disappearing as being non-essential, since floors have been lowered to their level and bodies have been widened. Several makes still provide them optionally.

One new passenger car made its appearance—the Crosley, as another very small and low-priced car in a class with the Bantam, whose manufacture was resumed. No passenger car makers discontinued, but one truck maker, Stewart, ceased production.

Statistics. Figures released by the Automobile Manufacturers Association at the year's end indicated that motor vehicle production during 1939 was 40 per cent above that of the previous year. Final figures were not available, but it was estimated that passenger car sales by the factories in the United States and their Canadian plants would total 2,960,000 of a wholesale value of about \$1,815,485,000, and truck sales 750,000, valued at wholesale at \$486,071,000. Parts, accessories, and tires for replacement—i.e. not sold on new vehicles—and service equipment had a combined wholesale value of \$1,283,540,000 which, added to the vehicle value, made a grand total of factory business of \$3,585,096,000, a dollar volume 29 per cent greater than that for 1938.

Figures on the production of motor vehicles in foreign countries last year will not be available until midyear, but the 1938 figures released by the Department of Commerce last July 1 through *Automotive World News*, afford some percentage comparisons. Of the world total of all vehicles was 4,000,809. Of these 33.6 per cent were produced outside of the United States and Canada, amounting to 1,345,582, made up of 920,455 passenger cars and 425,127 trucks and buses. American production was more than proportionately off that year, having averaged about 80 per cent of the total during the preceding four years. On account of the war's effect on the largest European producers it is quite certain that foreign production in 1939 did not exceed 30 per cent of the total, on which basis it may be estimated to have

been about a million passenger cars and half a million trucks and buses, bringing the world total to about 5,300,000 vehicles. In 1938 foreign producing countries exported 15.9 per cent (214,164 vehicles) of their production; the United States and Canada 12.6 per cent (334,974 vehicles). The same countries imported 103,271 vehicles as compared with the United States and Canadian importation of 15,344.

While the 472,000 American motor vehicles sold outside of the United States (exports and Canadian production) in 1939 was only 20,000 less than in 1938, its per cent of total production dropped from 18½ to 13 because of the increased domestic business. The total value of motor vehicles, parts, and tires exported from the United States and Canada, however, increased 2 per cent amounting to \$322,000,000.

Registration of motor vehicles started upward again, increasing 4 per cent. At the end of 1939 it had reached 30,710,000 made up of 26,250,000 passenger cars and 4,460,000 trucks. World registration correspondingly increased to 45,000,000; the percentage in the United States remained the same, 68 per cent.

Employment in the automobile, body, and parts factories averaged 389,000 workers and the weekly payroll \$12,226,000. Compared with the corresponding 1938 figures these were 21 and 40 per cent higher, respectively—an interesting comparison with the production increase of 40 per cent.

Taxes also took an upturn. The 6.6 per cent increase of total motor-user taxes was larger than the registration increase of 4 per cent. The new high of \$1,631,000,000 of motor-user taxes, however, was only 11 per cent of all taxes, Federal, State, and local, as it had been in 1938. Gasoline taxes accounted for nearly two-thirds of the total, \$1,035,000,000 being collected by Federal, State, and municipal governments. This also was a greater increase (7 per cent) over the previous year than the percentage increase of vehicles in use.

In the consumption of raw materials for the manufacture and use of motor vehicles as compared with total consumption, the percentages continued to be substantially what they have been for several years to wit: Gasoline 90 per cent, rubber 80, plate glass 69, lead 33, nickel 25, steel 16, copper 13, aluminum 12, tin 11, zinc 10, and lumber and hard wood 2. The gasoline used by motor vehicles was estimated at 20,787,000,000 gallons of a retail value, including taxes, of \$4,050,000,000. The railroads enjoyed an 8 per cent increase in automotive freight, handling 3,460,000 carloads.

The motor-vehicle retail business was likewise good in 1939. While no figures are procurable of the total volume of business the number of establishments gives some implication. The total retail outlets—selling vehicles, repair parts, and accessories—excluding duplications were 94,494. Included in this figure were 86,709 repair shops and 40,599 new car and truck dealers. Wholesalers numbered 6176 and the total of retail gasoline outlets was 400,000.

Motor Transportation. Motor vehicles in use in this country last year yielded an estimated total of 250,000,000,000 miles of motor transportation, allowing an average of 8850 miles per year per passenger car and 10,100 miles per year per truck. There are now approximately two passenger cars to every three families in the United States and about 60 per cent of their use is for business or as a utility. Pleasure or recreational

use of passenger automobiles is not without its commercial significance considering that about five billion dollars was spent by the 50,500,000 people who took touring vacations. Seven million people visited the national parks during 1939, most of them traveling by motor car, as about 90 per cent of all travel in America is by motor. Approximately 367,230 motor vehicles are owned by the Federal, State, and local governments.

At the end of the year there were 4,460,000 motor trucks registered, for which their operators paid taxes of \$421,000,000 made up of registration fees, gasoline taxes, miscellaneous state taxes (including special motor-carrier taxes), Federal excise, and special city and county taxes, an average per vehicle registered of nearly \$95. Truck use gave employment to nearly 3,760,000 drivers. Of the total trucks 960,000 were operated in fleets of eight or more by 25,116 operators. Buses in use were 134,000 and, during the year, about 18,000 new ones were produced. The motor bus industry showed increases in the year, largely from bus replacement of trolley cars in small municipalities and also from travel to and from the San Francisco and New York world's fairs, for it is estimated that 6 per cent of the visitors to the fairs used buses. Three quarters of the visitors to the fairs, according to a survey made, traveled by motor car.

The European situation focused attention on national defense in 1939, and military experts and engineers made surveys of our existing highway facilities and motor equipment to determine the potentialities for moving troops and supplies. This country fortunately already has facilities for military requirements that were created for and very largely financed by the taxes paid by motor vehicle owners which, for three years, have exceeded a billion and a half annually. As indicating the extent to which adequate highways are needed to serve only one of the vital functions of government, rural free delivery of mails extends over routes totaling 1,390,000 miles of public roads, exclusive of city delivery.

Though rail and motor transportation are competitive, they are also co-operative. One out of every seven rail carloads is automotive material. A railroad official recently stated, "64 American railroads operate more than 5200 buses over approximately 50,000 route miles, while 53,000 trucks are operated by railroads in terminal transfers, intercity and store-door delivery service." The far greater part of railroad use of motor transportation is hired service. In the first quarter last year freight carried over the highways in their own vehicles represented 1,320,000 ton-miles, while the railroads shipped in vehicles they did not own 7,662,000 ton-miles. In the same period the railroads carried 439,408 passengers over the highways, of which 155,351 were transported in railroad-owned vehicles. Railroads are the outstanding long-distance haulers, for 80 per cent of trips made by trucks are less than 20 miles, according to sample studies made in 1939 in connection with highway planning surveys. By contrast only 6.4 per cent of all trips recorded were 50 to 500 miles long, but they accounted for 41.2 per cent of total vehicle mileage. Large proportions of livestock, fruit, and vegetables are sent over the highways by direct shipment on long hauls because of their perishable character.

Automobile Accidents. Intensive industry attention has been given to traffic safety during the past four years. In that time funds contributed

by the manufacturers of cars, parts, tires, petroleum refiners, finance companies, and others to various organizations directly or indirectly interested in accident prevention, have totaled \$1,600,000. This cost was significant compared to the estimated saving of 29,000 lives and one billion dollars in property damage, the accident fatality rate having been lowered 37.3 per cent.

With December records incomplete traffic fatalities for 1939 would total an estimated 31,500, a reduction of 2 per cent in spite of a 6 per cent increase in motor vehicle mileage. Probably 1939 will have proved to have been the safest for motorists and pedestrians in the past seven years. November closed a two-year period of steadily declining traffic fatalities. The new record of less than 11 deaths per hundred million vehicle miles strikingly contrasts with the 1935 rate of more than 17. Most of this must be credited to more effective administration of traffic safety functions by state and local public officials. Much is also due to support given by civic and professional groups and awakening of public attentiveness to caution in walking and driving, through the press, the radio, and the distribution of safe-driving literature. More specifically contributing factors were wide-spread application of the Standard Highway Safety Program for States; completion of the Highway Planning Surveys by the Public Roads Administration in collaboration with state highway departments; establishment of official co-ordinating committees in five important states; better cars and equipment; better acceptance by the public of effective enforcement and educational programs and a growing willingness on the part of individuals to co-operate.

Grand prize awards in the National Safety Council's Traffic Safety Contest for 1938 were made last year to New Jersey as the safest state and Providence, Rhode Island, as the safest city. During 1939 New Hampshire showed the largest accident reduction, 24 per cent. Twenty-three states showed improvement. Among cities Kansas City, Mo., had the largest reduction, 55 per cent.

Legislation. Last year 44 state legislatures convened. Over 10,000 bills were introduced that potentially affected highway users, but only 1200 became laws. A summary of the laws relating to motor-fuel taxes shows one increase and no reductions and all emergency taxes were continued, following the usual experience. Only twice has the rule failed that once applied they are continued. Previously levied emergency gasoline taxes due to expire last year were continued in eight states. Bills to reduce the fuel tax were defeated in 10 states and bills to increase it in 12 states. In general Diesel fuel is now taxed on a par with gasoline, if not directly then indirectly, as in Nebraska, by doubled registration fees. New Mexico had charged more for Diesel fuel but lowered it to the gasoline rate, though Nevada raised it to one cent more per gallon than for gasoline.

Registration and license fees were increased in six states, decreased in three, and revised in seven. The experience of those states that heretofore have postponed registration dates to encourage winter use of cars and augment gasoline tax revenue, led seven more states and the District of Columbia to provide extensions, bringing the number now up to 24. Efforts to extend the date failed in seven states, however.

Diversion to other than highway construction, maintenance, and administration of any revenue derived from fuel taxes or registration fees reached

an extent and proportions in recent years that aroused increasing protestation. To remove the temptation from harassed legislators, four states made it constitutionally prohibitory, and last year three more states adopted anti-diversion amendments and five additional ones took the necessary preliminary steps. Actual diversions were defeated in many states. In some other states there were new or increased diversions, so that the gross amount diverted may equal or even exceed that of previous years. In New York diversions reached a new ceiling of about \$73,000,000.

Another recent legislative trend stirred even wider resentment, the passage of such laws as restrict trade between states, some directly affecting motor transportation, others the products carried. During the past year conventions and pronouncements were especially directed against these trade barriers by the Department of Agriculture, the Council of State Governments, governors, writers, and other organizations and prominent individuals, as certain to increase consumer's costs. Port of entry laws were among those so castigated. No new ones were enacted; Oklahoma repealed its law, and New Mexico modified the one on its books. Progress was also made in the extending or reciprocity between states and the liberalizing of non-resident privileges. Eight states enacted new reciprocal laws and in three, attempts to repeal them were defeated. Low limits of size and weight were raised in 10 states, bringing them in line with the Uniform Code recommended by the American Association of State Highway Officials. Practically all new carrier regulation was in the nature of amendments reconciling state legislation with the Federal Motor Carrier Act. Legislation to regulate licensing and taxing of itinerant merchants proposed in 24 states passed in only five. While some control of peddlers is justified, carried to the extent of interfering with competition it is not in the public interest. West Virginia joined Pennsylvania in prohibiting certain practices in transporting automobiles, but by amendment the Pennsylvania law will not become effective until 1942.

Much legislative attention was given to increasing highway safety. Scores of laws passed dealt with drunken drivers. Speed limits were amended or established, but most tended to raise limits too restrictive for daylight driving. With Florida enacting a highway patrol law every state now has some type of patrol. Florida also adopted the uniform drivers' license laws. Again Massachusetts stands alone in requiring compulsory insurance. This time eight states rejected it. Four more states adopted the uniform financial responsibility law sponsored by the American Automobile Association, bringing the total up to 31. Compulsory periodic inspection of motor vehicles for which favorable sentiment had appeared to be growing, had its ups and downs. Arkansas and Nebraska repealed their laws and six states failed to pass such bills, being stopped in two by the governor's veto. West Virginia did adopt it, Maine and Vermont strengthened their existing requirements, and South Carolina extended its inspections to include private automobiles. See ELECTRICAL ILLUMINATION; BUSINESS REVIEW; INTERSTATE COMMERCE COMMISSION; ROADS AND STREETS.

H. R. COBLEIGH.

AVIATION. See AERONAUTICS.

AZERBAIJAN (ä'zär-bi-jän') **SOVIET SOCIALIST REPUBLIC.** One of the 11 constituent republics of the U.S.S.R., adjoining northwest Iran. It includes the Nagorno-Karabakh Autonomous Region (1660 sq. mi.) and the Nakhichevan Autonomous Soviet Socialist Republic (2280 sq. mi.). Total area, 33,200 square miles; total population (Jan. 17, 1939), 3,209,727. Capital, Baku (800,000 inhabitants). The production of petroleum (22,400,000 metric tons in 1938), especially in the Baku region, is the most important industry. New chemical industries for the manufacture of soda, fertilizers, and synthetic rubber were started in connection with oil refining. Ninety per cent of the peasant farms have been collectivized. The chief agricultural products are wheat, rice, cotton, grapes, nuts, olives, and saffron. In the Lenkoran district, tea, tangerines, lemons, tungs, bamboo, and eucalyptus trees are cultivated. Iodine and bromine are extracted from the pit-hole waters near Baku. Magnetic ironstone, alumina, copper, pyrites, and barites are mined. Sturgeon and gray mullet fishing is an important industry along the seacoast of the Kura lowlands. The capacity of the Azerbaijan electric power stations in 1938 was 248,000 kilowatts. A 300,000 kw hydro-electric power station was being constructed near the village of Mingechaur. See UNION OF SOVIET SOCIALIST REPUBLICS.

AZORES, a-zörz'. A group of nine islands (Corvo, Fayal, Flores, Graciosa, Pico, Santa Maria, São Jorje, São Miguel, Terceira), in the Atlantic Ocean, 800 miles west of Portugal of which it is, administratively, a part (3 districts). Area, 922 square miles; population (1930 census), 253,935. Chief towns: Ponta Delgada (capital), 18,022 inhabitants; Angra, 10,642; Horta, 7643. The principal products consist of oranges, pineapples, olives, grapes, and bananas. There were, in 1938, some 600 miles of roads.

BADEN. See GERMANY.

BADMINTON. See SPORTS.

BAHAMAS, ba-hä'maz or ba-hä'maz. A British crown colony in the West Indies, consisting of an archipelago of islands, cays, and rocks, extending from Florida to the island of Haiti. Land area, 437 $\frac{5}{4}$ square miles; population (Jan. 1, 1939), 67,726 compared with (1931 census) 59,828. The chief islands are Abaco, Acklins, Andros, Bimini, Cat Island, Crooked Island, Eleuthera, Exuma, Grand Bahama, Inagua, Long Island, Mayaguana, New Providence, Rum Cay, and San Salvador (or Watlings)—said to be the first land sighted by Columbus when he discovered the New World in 1492. Capital, Nassau (on New Providence). During 1938 there were 2146 births, 1222 deaths, and 546 marriages. Primary and secondary schools had 16,131 pupils enrolled at the end of 1938.

Production and Trade. The chief products in 1938 were sponge, tomatoes (raw), pine timber, salt, cascarilla bark, shell (tortoise and conch), and crawfish. Livestock in the colony (1938): 1304 horses, 1231 horned cattle, 13,178 sheep, 6198 goats, 5980 swine, and 32,092 poultry. In 1938 (exclusive of specie), imports were valued at £1,138,839 (about 34 per cent of this total was expended on food, drink, and tobacco); exports (including re-exports of £64,688), £213,135 of which sponge (927,000 lb.) accounted for £90,054. Ships (steamers, and sailing vessels) entered and cleared the ports in 1938 aggregated 4,307,423 tons. Highways in the same year extended 1060 miles.

Government. For 1938, revenue totaled £411,764; expenditure, £655,460. Public debt (Dec. 31, 1938), £253,000. Executive power is vested in a governor who is assisted by an executive council of 8 members. There is a legislative council of 9 nominated members and a house of assembly of 29 members elected by electors having a small property qualification. Women do not vote. Governor and Commander-in-Chief, Sir Charles Dundas (appointed May 21, 1937).

History. On Sept. 4, 1939, because of the outbreak of war in Europe, the legislature passed emergency laws which placed the Bahamas on a war basis. Censorship was imposed and a food control committee was appointed to regulate prices and food distribution.

BAHREIN ISLANDS. See ARABIA.

BAKER, THOMAS STOCKHAM. An American educator, died in Pittsburgh, Pa., Apr. 7, 1939. Born in Aberdeen, Md., Mar. 28, 1871, he was educated at Johns Hopkins University (A.B., 1891; Ph.D., 1895) and studied at the University of Leipzig in 1892. From 1895 to 1908 he was associated with Johns Hopkins as lecturer and associate in modern German literature, and during part of this period was music critic (1895-1905) of the *Baltimore Sun* and professor of modern languages (1900-08) at The Jacob Tome Institute, Port Deposit, Md. He became director of the Institute in 1909 and remained there until 1919 when he became secretary to The Carnegie Institute of Technology. Elected president in 1922, he served as such until 1935 when he retired as emeritus and trustee.

Dr. Baker delivered a series of lectures on America under the auspices of The Carnegie Foundation for International Peace in Paris in 1928 and also lectured on "The Significance of the United States for Europe in the Twentieth Century" at various German universities in 1933 under the auspices of the Carl Schurz Memorial Foundation. He organized the first, second, and third international conferences on bituminous coal held at Carnegie Institute 1926, 1928, and 1931, and was recognized as one of the world's foremost authorities on the science of coal.

A frequent contributor to magazines and newspapers, he was the author of *Lenau and Young Germany*, and editor of Hauptmann's *The Sunken Bell* (1898).

BAKER, HOWLAND, AND JARVIS ISLANDS. Three small islands claimed by the United States which fringe the equator in mid-Pacific, situated approximately 1000 miles south and southwest of the Hawaiian Islands. Baker Island is at longitude 176° 31' W., Howland at approximately longitude 177° W., and Jarvis at longitude 160° W. They lie athwart the principal steamship lanes and the Pan American Airways route from Honolulu to New Zealand and Australia. These previously uninhabited islands were occupied as aerologic stations during 1936 by the U.S. Department of the Interior (see 1936 YEAR BOOK). An airfield was leveled off at Howland Island in 1937.

BALEARIC ISLANDS. A group of islands of great strategic importance, situated in the Mediterranean off the east coast of Spain, forming a province of that country. Area, 1935 square miles; population, estimated Dec. 31, 1934, at 376,735. Capital, Palma (population, 93,014), on Majorca, the largest island of the group. Minorca and Iviza are the other chief islands. When the Spanish civil war broke out in July, 1936, Majorca and Iviza

were captured by the Insurgents while Minorca was held by the Loyalist Government. For developments in 1939, see SPAIN under *History*.

BALI. See NETHERLANDS INDIES.

BALKAN ENTENTE. A bloc of Balkan states—Greece, Rumania, Turkey, and Yugoslavia—which by the treaty of Feb. 9, 1934, mutually guaranteed their frontiers against aggression by any of the Balkan countries. The treaty bound the four governments to undertake no political action and assume no political obligation toward any Balkan country not a signatory of the pact without the consent of the other contracting parties. In general they agreed to adopt a unified foreign policy on inter-Balkan issues, and to strengthen their economic collaboration. The entente represented an effort to stabilize the territorial status quo in the Balkans and at the same time to free the Balkan states of their traditional diplomatic dependence upon the great powers. On July 31, 1938, Premier Metaxas of Greece, as President of the Balkan Entente, concluded an agreement with Premier Kiosseivanov of Bulgaria authorizing Bulgaria to restore conscription and rearm in disregard of provisions of the Treaty of Neuilly. In return the Bulgarian Government pledged itself to seek revision of its boundaries only by peaceful means.

Events of 1939, and particularly the outbreak of war in September, placed great strain upon the Balkan Entente. The annexation of Bohemia and Moravia by Germany, the Nazi military occupation of Slovakia, and the Italian conquest of Albania placed all the Balkan Entente powers in more exposed and dangerous positions with respect to the Reich and Italy. At the same time the agitations in Bulgaria and Hungary for the restoration of territories lost to Rumania, Greece, and Yugoslavia received encouragement.

The Turkish alliances with Great Britain and France and the action of the Anglo-French bloc in guaranteeing the independence of Rumania, Greece, and Turkey likewise tended to weaken the solidarity of the Entente and to draw the members into the combinations of the great powers. Their increasing dependence upon German trade exposed them to powerful economic and political pressure from Berlin.

The German-Soviet non-aggression pact of Aug. 24, 1939, marking the failure of Anglo-French efforts to bring the Soviet Union into their "peace front," and Italy's non-intervention in the war between Germany and the Anglo-French-Polish bloc led all of the Balkan states to follow the Italian policy of non-participation, although only Rumania and Yugoslavia formally declared their neutrality. At the same time the Balkan Entente renewed its efforts to reach a settlement of Bulgarian territorial claims and minority questions in dispute with Rumania, Greece, and Yugoslavia, as a preliminary to Bulgaria's adhesion to the Pact. Italy also lent her support to the creation of a neutral bloc, comprising the Balkan states and Hungary, that it was hoped might prevent the spread of the war into southeastern Europe.

The fifth annual conference of the Foreign Ministers of the Balkan Entente powers met in Bucharest Feb. 20-21, 1939. While reaffirming their opposition to territorial revision, they voted to open trade discussions with Bulgaria. The economic conference of the Balkan Entente, held in Bucharest in May, discussed the payment of commercial debts to Rumania owing by the other

member states and the regulation of railway and postal traffic.

BALKAN STATES. The states of the peninsula south of the Danube, and bounded by the Adriatic, Ægean, and Black Seas. See ALBANIA, BULGARIA, GREECE, ROMANIA, TURKEY, and YUGOSLAVIA.

BALTIC ENTENTE. A bloc comprising the three Baltic States—Estonia, Latvia, and Lithuania—for the mutual protection of their independence and promotion of joint economic, political, and cultural interests. By a treaty signed Sept. 12, 1934, the three governments agreed to co-operate on all joint questions of foreign policy, to confer together at least twice annually, to settle their mutual disputes peaceably, and to establish closer unity and collaboration among their diplomatic representatives abroad and at international conferences. All three states had previously concluded non-aggression pacts with the Soviet Union. In the spring of 1939 they signed similar treaties with Germany. For other developments in 1939, see ESTONIA, LATVIA, and LITHUANIA under *History*.

BANKERS ASSOCIATION, THE AMERICAN. The principal national organization of banks in the United States and the largest in the world, having a membership of nearly 14,000 banks, or 95 per cent of all banking assets in the country. Its four major divisions are devoted to the special interests, technical advancement and general welfare of the following classes of banks: National, state, savings, and trust companies. The Association also maintains the American Institute of Banking, educational section of the Association, and The Graduate School of Banking. The former has a membership of 65,000 bank employees in every principal city throughout the country. The latter is operated at Rutgers University for advanced education of bank officers. The Association also maintains a state secretaries section which forms a link between the national organization and the 48 state bankers' associations.

The Association's governing body is its annual convention, held in 1939 at Seattle, Washington. The program provided a series of technical discussions to develop the latest information on bank operation. It brought together a group of leaders from the fields of business and research who presented broad surveys of the American business outlook, the future course of banking, research developments, and current trends in American political and governmental institutions.

The national officers elected for 1939-40 were: President, Robert M. Hanes, president of the Wachovia Bank and Trust Company, Winston-Salem, North Carolina; first vice-president, P. D. Houston, chairman of the board, American National Bank, Nashville, Tenn.; second vice-president, Henry W. Koenek, president, The Security Bank of Ponca City, Oklahoma; treasurer, B. Murray Peyton, president, The Minnesota National Bank, Duluth, Minn.; executive manager, Dr. Harold Stonier, New York, N. Y.; secretary, Richard W. Hill, New York, N. Y. The national headquarters are at 22 East 40th St., New York City. A branch office is maintained in Washington, D. C.

BANKRUPTCY. See BUSINESS REVIEW; LAW. **BANKS AND BANKING.** Bank deposits expanded to reach the largest volume on record during 1939. The chief reason for this was the unprecedentedly heavy inflow of gold from abroad. Such gold imports aggregated \$3,574,414,000 during the year. As the Treasury paid for this gold, the sellers received additional deposits in domestic banks which constantly swelled the total. Contributing factors to the increase in bank deposits were additional purchases of government bonds and a moderate increase in commercial loans by the banks of the country.

The credit authorities pursued a passive policy during the year, permitting the unprecedentedly heavy influx of gold to expand excess reserves without seeking to sterilize the yellow metal imported from abroad or to raise legal reserve requirements. However, new legislation to permit the Board of Governors of the Federal Reserve System to increase legal reserve requirements of member banks above the limits now specified by law was given careful consideration, in order to provide the authorities with the power to check inflationary boom conditions should such conditions make restrictive measures desirable in the future.

In one respect, however, a new development in credit policy became apparent. When the European war began, a severe reaction occurred in the government bond market because a number of banks feared that interest rates would rise and bond quotations would fall, just as happened during the World War. Long term Treasury obligations declined by as much as nine points during the first half of September. The Federal Reserve Banks embarked upon vigorous open market buying operations to support the government bond market, adding \$400,000,000 to their holdings of United States government securities during the three weeks ended September 20. Thereafter, when the market for Treasury obligations rallied briskly, as it became evident that the war in Europe did not reduce in any way the huge surplus of funds seeking investment in this country, the Federal Reserve Banks disposed of small amounts of Treasury securities. At the same time, spokesmen for the system indicated that efforts to maintain an orderly market for Federal securities would be a regular feature of credit control policy henceforward, because of the very large stake that the banks of the country have in a stable market for government bonds, their chief asset. However, it was emphasized that the objective of such Federal Reserve Bank intervention in the government bond market would be to smooth out fluctuations, rather than to stabilize quotations around any particular level. Among bankers, however, the contention was advanced that such intervention in the market, by making quotations palpably artificial for a time, might more likely exaggerate than smooth out fluctuations.

A number of banks reported larger earnings for the year, especially institutions in the metropolitan centers, because of additions that they made to their holdings of longer term government obligations. Many institutions that steadfastly refused to hold substantial amounts of longer term Treasury obligations, fearing that extremely low interest rates would not last and that long term bond prices would decline, found it necessary to modify this policy in order to expand their earnings to a level that would enable them to cover their expenses and to pay moderate dividends on

their stocks. As yields on short term gilt edge investments have declined steadily toward the vanishing point, banks that refuse to buy medium and longer term government bonds, particularly those that do not have any substantial amount of loans, have been confronted with the problem of insufficient earnings. In a growing number of instances, bank managements have decided to hold considerable amounts of longer term bonds, and to build up reserves out of the resulting larger earnings against possible future depreciation of these obligations. Just because many banks have bought longer term obligations reluctantly, however, a number of them tend to liquidate early whenever they think a turn in the trend of interest rates has occurred, as was the case when the European war broke out. This tends to make the market for longer term government bonds more sensitive than would ordinarily be the case.

The principal assets and liabilities of the commercial banks insured by the Federal Deposit Insurance Corporation on June 30, 1939, with comparisons, were as follows:

| Total | 13,569 | 13,659 | 13,723 |

The changes during the year in the position of the larger banks of the country, comprising the weekly reporting member banks of the Federal Reserve System, are shown in accompanying table.

Credit Control Policy. The effect of the passive attitude of the credit authorities toward the consequences of the enormous gold imports was apparent in the rapid expansion of excess reserves of the member banks of the Federal Reserve System. These excess reserves rose from \$3,298,000,000 on January 4 to a record peak of \$5,534,000,000 on October 25. Thereafter, a decline occurred as the Federal Reserve Banks reduced their holdings of government securities, following the September market support operations, and as the usual seasonal expansion of currency circulation occurred in the closing weeks of the year. Excess reserves dipped temporarily below \$5,000,000,000 during December, but with gold imports continuing on a large scale it was apparent that the expansion in the surplus balances of member banks would recur immediately after the turn of the year. Along with this expansion in excess reserves

went a constant increase in the total of bank deposits, which rose well above the previous 1929 peak during the year. The deposits, exclusive of interbank deposits, of all member banks of the Federal Reserve System rose to \$39,287,000,000 on October 2, which compared with \$36,211,000,000 at the close of 1938 and \$33,865,000,000 at the close of 1929. Deposits of non-member commercial banks are still well below the 1929 level, because of the sharp reduction that has occurred in the number of such institutions, but the decline in non-member bank deposits since 1929 is now smaller than the increase that has occurred in the deposits of all member banks.

There was growing recognition during the year that the fundamental banking problem of the country was the enormous influx of gold from abroad. Increasing criticism was heard in many quarters of the purchase by the Treasury of all gold offered at \$35 an oz., although all thoughtful students of the subject recognized that any cessation of the gold buying policy would have profound repercussions upon American export

trade, the foreign exchange status of the dollar and the economic situation in the countries that were selling us these large amounts of gold. While individual members of Congress displayed impatience with the constant purchases of gold, in view of the growing skepticism about the ability of this country ever to dispose of this yellow

metal abroad in the future, responsible Administration officials felt that the adverse effects of the huge gold influx and the consequent rise in excess reserves to fantastic levels were potential rather than actual. Because of the decline in the velocity of turnover of bank deposits, the increase in the volume of deposits failed to stimulate business activity or to boost commodity prices. The average velocity of turnover of commercial bank deposits during 1939 was $13\frac{1}{2}$ times a year, which was by far the lowest since these statistics were first compiled in 1920, and compares with 22 times a year in the 1922-26 period. Only when the greatly increased volume of bank deposits will actually be put to use, it is recognized, will the danger of inflation become actual.

Reflecting the growing interest in the surplus gold problem, the Senate authorized a broad investigation of the question by its Banking and Currency Committee. The authorization of this investigation followed Congressional approval, after a fight, of an extension of the power of the President to devalue the dollar to 50 per cent of its old parity for another two years beyond June 30, 1939. While a good deal of preliminary work was done by various Federal agencies in connection with this inquiry, which would inevitably come to grips with the gold question, the outbreak of the European war tended to force the whole problem into the background. Since by far the largest part of the world's monetary gold stock held outside the United States is in the hands of Great Britain, France, and the British Empire nations, and inasmuch as the Allies are not able to borrow here, as was the case during the last war, it was felt that any step that was taken to reduce our purchases of gold would limit the buying power of these nations in the United States, and so hamper them in the war. Hence, active consideration of new banking legislation by the end of the year was limited to a mere authorization of the Board of Governors of the Federal Reserve System to increase legal reserve requirements of member banks beyond the limits contained in the Federal Reserve Act, so as to scale down excess reserves in this way should such action become necessary because of an upturn in the velocity of turnover of bank deposits.

In contrast with what occurred in 1914, the outbreak of the war in Europe had surprisingly little

United States, which reached a monthly peak of \$605,797,000 in April. After the war began, gold shipments declined; but when shipping arrangements could be made, imports again increased, especially after direct shipments from South Africa to the United States had been arranged. Also, considerable amounts of gold previously accumulated here for foreign account and held under earmark were released, to provide additional purchasing power in this country and replenish bank balances here. The decline in the pound sterling and the franc was regarded with equanimity by the monetary authorities, as it was felt that Great Britain and France could not take advantage of the lower quotations of their currencies to increase sharply their exports to competitive foreign markets while the war went on.

Excess reserves of the member banks of the Federal Reserve System rose from month to month during 1939 as follows:

RESERVE POSITION OF MEMBER BANKS
[In millions of dollars]

| End of month | Total reserves | Excess reserves |
|--------------|----------------|-----------------|
| January | 9,029 | 3,484 |
| February | 8,925 | 2,047 |
| March | 9,021 | 3,432 |
| April | 9,624 | 3,926 |
| May | 9,997 | 4,212 |
| June | 10,085 | 4,246 |
| July | 10,321 | 4,402 |
| August | 10,659 | 4,607 |
| September | 11,443 | 5,198 |
| October | 11,862 | 5,490 |
| November | 11,688 | 5,259 |
| December 20 | 11,378 | 4,900 |

Federal Reserve Banks. Apart from the constant increase in their holdings of gold certificates, which the Treasury deposited against newly purchased gold, the only important change in the statement of the Federal Reserve Banks for the year was the increase in government bond holdings in September, designed to neutralize the effect of liquidation by commercial banks and others due to the outbreak of the war, and the subsequent liquidation of some of these additional purchases of government obligations after the bond market had rallied sharply. Changes in the principal assets and liabilities of the 12 Federal Reserve Banks during the year were as follows:

PRINCIPAL ASSETS AND LIABILITIES OF THE 12 FEDERAL RESERVE BANKS
[In millions of dollars]

| End of Month | Gold certificates on hand and due from U.S. Treasury | Bills discounted | U.S. Government bonds | Treasury notes | Treasury bills | Federal Reserve notes in actual circulation | Member bank reserve deposits | Treasury deposits |

| December 20 | 15,135 | 8 | 1,263 | 1,233 | — | 4,980 | 11,378 | 694 |

effect upon the credit structure, so that those concerned with the formulation and administration of credit control policies largely restricted themselves to the role of observers. The establishment of the German protectorate over Bohemia and Moravia in March accelerated shipments of gold to the

Bank Portfolio Policies. The more important changes that occurred in bank portfolios during the year were the following:

1. The member banks added to their holdings of United States government and government-guaranteed bonds during the year. This contributed

materially to the earnings of a number of banks, especially those that had previously refrained from buying intermediate and longer term obligations, and so realized a very low rate of return on their investments previously. On the other hand, some banks were tempted to sell some of their long term bonds in order to realize profits where they had been purchased some time previously at lower prices.

2. The upturn in business activity during the later part of the year caused a moderate increase in commercial loans. Experience has shown that ordinary loans of banks tend to rise most rapidly when inventories are expanding, and this proved to be the case again in the closing months of 1939.

3. Banks displayed keen interest in the possibility of expanding their earnings through embarking upon types of lending not traditional for commercial banks. A number of institutions sought earnestly through the year to make serial capital loans with maturities up to five and seven years, in order to offset the reduced demand for short term commercial loans typical of recent years. In other instances, banks embarked upon installment lending and the making of personal loans to swell their income. In addition, the trend toward the imposition of additional service charges continued, so that more than a fourth of all bank gross earnings is now derived from fees and charges of various kinds, other than interest on loans and investments.

Changes in loans, investments, and deposits of reporting member banks of the Federal Reserve System, month by month, were as follows, as reported in the *Federal Reserve Bulletin*:

LOANS, INVESTMENTS, AND DEPOSITS OF REPORTING MEMBER BANKS IN 101 LEADING CITIES

(Monthly data are averages of weekly figures. In millions of dollars)

Bank Regulation Changes. Following the drastic changes in the basic rules governing bank examinations made in 1938, the regulatory authorities were content to stand aside and watch the effects of the new regulations before doing anything further. However, sentiment for the unification of the nation's banking system continued in evidence, and further centralization of the banking system either within the Federal Reserve System or under the Federal Deposit Insurance Corporation will probably be urged whenever the Senate Banking Committee inquiry gets under way. Furthermore, a number of banks were urging that supervision over Federal savings and loan societies should be shifted from the Federal Home Loan Bank Board to the Comptroller of the Currency, so as to co-ordinate the operation of these institutions with the commercial banking system. Such a change has been strongly resisted by the savings and loan associations.

Efforts to strengthen further the nation's bank-

ing structure continued in a number of directions. In individual instances, such as the Integrity Trust Company of Philadelphia, the F.D.I.C. and the Reconstruction Finance Corporation co-operated to effect a merger with other banks after making large loans on the frozen assets of the institutions. Steps were taken in some States also to lower interest rates paid on savings deposits so as to increase net earnings of banks. Thus, in New Jersey the banking board limited interest payments on savings deposits by all banks in the State to 1 per cent, which was expected to strengthen the net earnings position of savings and commercial banks in that State.

An open conflict developed during the year between the Treasury Department and the Bank of America of California, the nation's largest branch banking enterprise, over the future policy of that institution. The Treasury sought to effect a change in the management of the bank, a writing down of its real estate holdings, and the injection of a large amount of new capital by the Reconstruction Finance Corporation. This program was vigorously opposed as uncalled for by the management of the California bank.

JULES I. BOGEN.

BAPTISTS. A name first given in 1644 to certain congregations of English Separatists who maintained that immersion is essential to valid baptism. In the United States there are 19 Baptist

denominations, which had a combined membership of 9,836,229 in 1938, according to the *Year Book of American Churches* issued by the Federal Council of Churches of Christ. The larger groups (having membership over 50,000) are, in order of size, the Southern Baptist Convention, the National Baptist Convention, (Negro), the Northern Baptist Convention, the American Baptist Association, the Primitive Baptists, and the Free Will Baptists. Statistics for these denominations appear in the table under RELIGIOUS ORGANIZATIONS.

Southern Baptist Convention. This body of the Baptist denomination was formed in 1845, when Southern Baptists withdrew from the national organization on account of the slavery issue and also for the better administration of the work of the Convention. Since that time it has functioned, not as a new denomination, but as a separate organization for the purpose of directing missionary, educational, and general denominational work in the white Baptist churches of the Southern and Southwestern States. According to the

official *Handbook* for 1939 the Southern Baptist Convention comprised 18 State conventions.

The annual session of the Southern Baptist Convention was held in Oklahoma City, May 17-21, 1939. The various boards and agencies of the convention showed decided gains in receipts for the year. The director of the Work of Promotion in the Executive Committee, Dr. J. E. Dillard, led an "Every Member Canvass" during the week of Nov. 28 to Dec. 4, 1938, with the objective of securing weekly subscriptions totaling \$40,000,000.

The officers elected for 1939-40 were: The Rev. L. R. Scarborough, D.D., LL.D., of Ft. Worth, Tex., president; Dr. Rupert F. Naney, Oklahoma City, Okla., and Mr. Aquila Chamlee, Fort Valley, Ga., vice presidents; the Rev. Hight C. Moore, D.D., Litt.D., of Nashville, Tenn., and Mr. J. Henry Burnett of Macon, Ga., recording secretaries; and the Rev. Austin Crouch, D.D., of Nashville, Tenn., executive secretary, and the Rev. J. E. Dillard, D.D., of Nashville, Tenn., secretary of promotion. Headquarters are at 161 Eighth Avenue, North, Nashville, Tenn.

National Baptist Convention of America (NEGRO). The Convention held its 1939 session at the Second Baptist Church, Los Angeles, California, while the Woman's Auxiliary of this Convention held its session in the New Hope Baptist Church, Los Angeles, California. The dates were Sept. 6-10, 1939. The Convention's Theme was "Witnessing For Christ."

There were representatives from 32 States and three foreign countries, including the Bahama Islands. The Convention went on record as pledging to do greater missionary work, home mission and educational endeavor, and to raise more money for the extension of the gospel on foreign and home fields; it reiterated its age-old principles in the New Testament Church. It listened to fraternal messages from other bodies, especially the able address by the representative of the Southern Baptist Convention (white). The next session was awarded to Louisville, Kentucky, the dates being Sept. 4-8 inclusive, 1940.

The personnel of the officials is Rev. G. L. Prince, D.D., President, 2610 Avenue L, Galveston, Texas; Rev. C. P. Madison, D.D., Secretary, Norfolk, Va., Rev. A. A. Lucas, D.D., Treasurer, Houston, Texas, Rev. G. C. Coleman, D.D., Vice President, Oakland, Cal., Rev. Henry Allen Boyd, Secretary, Sunday School Congress, 523-2nd Avenue North, Nashville, Tenn., Mrs. M. A. B. Fuller, President, Woman's Auxiliary, 1105 Angelina Street, Austin, Texas. The headquarters are at 523-2nd Avenue North, Nashville, Tenn., at the National Baptist Publishing Board's plant.

Northern Baptist Convention. This body of the Baptist denomination, according to the *Annual* of the Northern Baptist Convention, was composed in 1939 of 36 conventions in 33 States, the District of Columbia, and Puerto Rico. The thirty-second annual meeting of the Northern Baptist Convention was held in Los Angeles, Calif., June 20-25, 1939. Its general theme was "Victory Through Discipline." The officers elected for 1939-40 were: President, Prof. Elmer A. Fridell, Berkeley, Calif.; first vice president, Mrs. Bradford Abernethy, Columbia, Mo.; second vice president, Prof. William A. Mueller, Philadelphia, Pa.; corresponding secretary, the Rev. Maurice A. Levy, D.D., Williamsport, Pa.; recording secretary, the Rev. Clarence M. Gallup, D.D., New York, N. Y.; and treasurer, Harold J. Manson,

Brooklyn, N. Y. The leading denominational papers were: *Baptist Observer* (Indianapolis); *Baptist Record* (Pella, Ia.); *Missions* (New York); *Watchman-Examiner* (New York); and "Minister" (Chicago).

The foreign mission field of the Northern Baptist Convention included Assam, Burma, South India, Bengal-Orissa, South China, East China, West China, Japan, Belgian Congo, and the Philippine Islands. The work of the Convention covers domestic, city, and foreign missions; higher education, social service, Sunday schools and pensions for clergy. Headquarters of the General Council, the executive body to which is entrusted the work of the Convention between annual meetings, are at 152 Madison Avenue, New York, N. Y.

Baptist World Alliance. An organization formed in London in 1905 for the purpose of bringing together in a world-wide fellowship Baptists of all nations, numbering in 1939 according to the latest Directory of the Baptist World Alliance between twelve and thirteen million members. The great English Non-conformist, Dr. John Clifford, was the first president. Successive international congresses were held in Philadelphia, (1911), Stockholm (1923), Toronto (1928), Berlin (1934), and Atlanta (1939).

The sixth and latest congress, in Atlanta, in July, 1939, was notable for its large attendance, exceeding all records of previous meetings. More than 40,000 persons were present for the annual sermon by the retiring president, Dr. George W. Truett, of Dallas, and some 57,000 persons witnessed the historical pageant which portrayed significant events in Baptist history. Outstanding was the emphasis on freedom of church and state, on individual liberty, and on personal evangelism—all significant and historical Baptist doctrines. Resolutions on race relationships found immediate application in the conduct of the congress itself, which was handled entirely by an interracial committee of white and negro Baptists from Atlanta.

Probably no religious gathering in America has ever been given such wide publicity through press and radio. With delegates from some sixty nations from every continent and from every nation of importance, with the sole exception of Russia, there was naturally intense public interest in the pronouncements regarding social and economic questions, the attitude toward peace and war, and the appeal for freedom of worship for oppressed free church groups in more than one European state.

The new officers elected to serve for a five-year period are: President, Dr. James H. Rushbrooke of London; General Secretary, Dr. Walter O. Lewis of Paris; Vice Presidents, Dr. E. A. Fridell of California, Dr. Hans Luckey of Hamburg, Germany, Dr. T. C. Bau of China, Dr. N. J. Nordstrom of Sweden, Dr. L. R. Scarborough of Texas, Rev. C. J. Tinsley of Australia, and Dr. Lacey K. Williams of Chicago; Honorary Associate Secretaries, Dr. Clifton D. Gray, President of Bates College, Lewiston, Maine, and Dr. Louie D. Newton of Atlanta; Treasurers, Mr. C. T. LeQuesne, K.C., of London, England, and Lieutenant Governor Albert Matthews of Ontario, Canada.

BAR ASSOCIATION, AMERICAN. A national organization, founded in 1878 to advance the science of jurisprudence, the administration of justice, harmony in legislation, and the observance of legal precedents throughout the United States,

as well as to uphold the legal profession and promote good understanding among its members.

The Association's sixty-second annual meeting was held in San Francisco, Calif., July 10-14, 1939. Frank J. Hogan, the retiring President, spoke at the opening session on "Important Shifts in Constitutional Doctrines." Other addresses and remarks of great interest were made by Mr. R. L. Maitland, K.C., representative of the Canadian Bar Association; Hon. Robert H. Jackson, then Solicitor General of the United States; Hon. James F. Byrnes, U.S. Senator from South Carolina; Mr. Stephen F. Chadwick, National Commander of the American Legion; Mr. W. F. Lilleston, of the Kansas Bar; Hon. Thurman Arnold, Assistant Attorney General of the United States; Hon. Charles Fahy, General Counsel of the National Labor Relations Board; and Hon. Calvert Magruder, Judge of the U.S. Circuit Court of Appeals for the First Circuit, and former General Counsel of the Wage and Hour Division of the U.S. Department of Labor.

The membership of the Association in 1939 was approximately 31,800. Its official organ is the *American Bar Association Journal*. Charles A. Beardsley, of Oakland, Calif., was elected President for 1939-40; John H. Voorhees, of Sioux Falls, S. D., was re-elected Treasurer; Harry S. Knight, of Sunbury, Pa., was re-elected Secretary; Joseph D. Stecher, of Toledo, Ohio, was re-elected Assistant Secretary; and Thomas B. Gay, of Richmond, Va., was re-elected Chairman of the House of Delegates. The headquarters of the Association are at 1140 N. Dearborn Street, Chicago, Ill. See LAW.

BARBADOS, bär-bä'dōz. A British crown colony in the West Indies. Area, 166 square miles; population (Jan. 1, 1939), 193,082. In 1938 there were 5327 births (27.3 per 1000), 3743 deaths (19.38 per 1000), and 869 marriages (9.02 per 1000). The average school attendance for 1938 in the 138 schools of all kinds was 21,707. Bridgetown, the capital, had 15,200 inhabitants.

Production and Trade. The principal products are sugar (111,414 tons in 1938) and cotton. Preliminary figures of the 1939 sugar crop place it at 157,000 tons. There are 107 sugar factories and 4 rum distilleries. Some 6014 tourists visited the colony during 1937. Sea fishing is an important occupation. In 1938, imports were valued at £2,086,901; exports, £1,354,155 (including re-exports, £135,576). Sugar, molasses, and rum accounted for £1,198,924 of the exports. Shipping entered Bridgetown (1938) totaled 2,191,793 net tons. Early in 1939 the Royal Dutch Air Lines commenced a thrice-weekly Trinidad to Barbados air service connecting with Curaçao weekly each way. Barbados had, in 1938, some 538 miles of roads.

Government. For the year ended Mar. 31, 1939 revenue totaled £559,484; expenditure, £560,038; net public debt, £379,052. For 1939-40, revenue is estimated at £526,543 and expenditure at £536,357. The government is administered by a governor who is aided by an executive council, a legislative council of 9 nominated members, and a house of assembly of 24 members elected by the people. During 1939 the Barbados celebrated the 300th anniversary of the first meeting of the house of assembly. In the same year there was agitation for the abolition of the constitution and the establishment of the crown colony system because it was thought that the colony would advance more rap-

idly without the brake of a house of assembly, which, in spite of the low franchise qualification, is elected by a small minority of the people. Governor, Sir E. J. Waddington (appointed Feb. 11, 1938).

BARLEY. The 1939 barley crop of the United States was estimated at 276,298,000 bu., 9 per cent more than the 253,005,000 bu. raised in 1938 and 19 per cent above the 1928-37 average and was grown on 12,600,000 acres versus 10,513,000 acres in 1938. The acre yield in 1939 averaged 21.9 bu. and in 1938 24.1 bu. The 1939 production of leading barley States was for Minnesota 59,808,000 bu., California 30,850,000, North Dakota 30,618,000, South Dakota 24,633,000, Wisconsin 22,591,000, Nebraska 14,651,000, and Iowa 13,794,000 bu. The seasonal average price per bushel received by farmers was 40.4¢ and the estimated value of production was \$111,716,000 in 1939 compared to 36.6¢ and \$92,605,000 in 1938. World production of barley, excluding the U.S.S.R. and China, was estimated at 1,712,000,000 bu. See *Crop Production* in 1939 under AGRICULTURE.

BASQUE (bask) PROVINCES. The north central Spanish provinces of Alava, Guipúzcoa, and Vizcaya (Biscay). Total area, 2739 square miles; population (Dec. 31, 1934), 947,559. See SPAIN under History.

BASUTOLAND, ba-sōō'tō-länd'. A native territory in South Africa, governed by Great Britain. Area, 11,716 square miles; population (1936 census), 562,311 of whom 559,273 were Bantu natives, 1434 were Europeans, and 1604 were colored (other than Bantu). In addition there were 101,273 absentee Bantus working in the Union of South Africa. Capital, Maseru. A total of 82,808 pupils were enrolled in all schools for 1938. The chief products consist of grain crops, wool, and mohair. Livestock census (1938): 1,470,361 sheep, 489,574 goats, 434,990 cattle, 87,788 horses, 25,314 donkeys, and 1076 mules. In 1938, imports were valued at £749,126; exports, £401,512 (grain £208,377, wool £125,241, mohair £41,584). For 1937-38, revenue totaled £418,917; expenditure, £364,649. The territory is administered by a resident commissioner under the direction of the British High Commissioner for Basutoland, Bechuanaland Protectorate, and Swaziland, the latter having the power to legislate by proclamation. Resident Commissioner, E. C. Richards (appointed May, 1935).

BATES, ERNEST SUTHERLAND. An American author, died in The Bronx, New York City, Dec. 4, 1939. Born in Gambier, Ohio, Oct. 14, 1879, he was educated at the University of Michigan (A.B., 1902; A.M., 1903). Upon graduation he joined the faculty of Oberlin College as an instructor in English, remaining there until 1905. He then tutored in English at Columbia University during 1903-08, when he obtained his Ph.D. in the latter year, upon the thesis *A Study of Shelley's The Cenci*. Thereafter Dr. Bates became professor of English at the University of Arizona; in 1915 he transferred to a similar post at the University of Oregon, becoming professor of philosophy in 1921. He left in 1925, but subsequently was a professor in the

extension division of the University in 1930, 1932, 1935, and 1936.

Turning to literary work, Dr. Bates became editor of *The Dictionary of American Biography* in 1926 and in 1930 he joined the reviewing staff of *The Saturday Review of Literature*. During 1933-36 he was associate editor of *The Modern Monthly*, and in the last-named year lectured at the Federal Forum, Portland, Ore. Also during this period he wrote reviews for the *New York Times*, and in 1939 he became associated with "Books" published by the *New York Herald Tribune*, reviewing those works dealing with social topics and the theories of Karl Marx, on which he was an authority.

A critic and historian, Dr. Bates was the author of *The Friend of Jesus*, which was published in England under the title *The Gospel According to Judas* (1928); *This Land of Liberty* (1930), a study of the suppression of civil rights in American history; *Mary Baker Eddy—The Truth and the Tradition* (1932), with J. V. Dittmore; *The Story of Congress* (1936); *The Story of the Supreme Court* (1936); *Hearst, the Lord of San Simon* (1936), with Oliver Carlson; *American Hurly-Burly* (1937), a history of the year with Alan Williams; and *Biography of the Bible* (1937). He edited *The Four Gospels* (1932) and *The Bible Designed to Be Read as Living Literature* (1936), his best-known work. He had just completed *American Faith*, a history of American religious beliefs.

BAVARIA. See GERMANY.

BEAUX-ARTS INSTITUTE OF DESIGN. A school of fine arts in New York City, planned after the École des Beaux-Arts in Paris and organized in 1916 by the Society of Beaux-Arts Architects. The enrollment during the year 1938-39 consisted of 800 architectural students and 53 students of mural painting. The Department of Sculpture was reopened in January, 1939 with an enrollment of 36 students for the year. The most important prize is that given by the Society of Beaux-Arts Architects, which, amounting to \$3600, affords two and one-half years' study in architecture at the École des Beaux-Arts in Paris. In the Department of Architecture during the year 1939-40, the following prizes will be offered: Illuminating Engineering Society Prizes totaling \$850, Emerson Prize \$50, Warren Prizes, totaling \$75, House Beautiful Prizes totaling \$75, Architectural Forum Prizes totaling \$75, Spiering Prize \$50, Kenneth M. Murchison Prize \$50, S.A.D.G. Prize \$50, Romer Prize \$50. The directors for 1939-40 were: Institute, John W. Cross; Architecture, Otto Teegeen; Mural Decoration, Alois Fabry, Jr.; Sculpture, Wm. Van Alen; Chairman of the Board of Trustees, William E. Shepherd. Headquarters are at 304 East 44th St., New York City.

BECHUANALAND (bĕch'ōō-ă'nă-lănd'; bĕk'ū-ă) **PROTECTORATE.** A native territory in southern Africa, under British protection. Area, 275,000 square miles; population (1936 census), 262,756 (257,064 natives, 3793 mixed, and 1899 Europeans). The chief villages are Serowe (28,987 inhabitants), Kanye, Molepolole, Mochudi, and Maun. There were 131 schools in operation during 1937-38.

Production and Trade. The chief industries are animal husbandry and dairying. Grain production is dependent on the rainfall. Livestock (1938 census): 649,424 cattle, 438,683 sheep and goats.

Gold and silver mining are carried on, the output for 1937-38 being valued at £122,412. Customs duties are collected by the Union of South Africa and paid into the Union Treasury from which a proportionate payment is made each quarter to Bechuanaland. Trade (1938): Imports, £361,316; exports, £375,719. In 1938 there were 396 miles of railway, and 2048 miles of roads suitable for motor traffic.

Government. For 1937-38, revenue totaled £273,230; expenditure, £264,537. The protectorate is administered by a resident commissioner (with headquarters at Mafeking, Cape Province) acting under the British High Commissioner for Basutoland, Bechuanaland, and Swaziland. Laws are made by proclamation of the High Commissioner. The Native Administration Proclamation 74 of 1934 established native administrations and defined the rights and powers of chiefs. There is a native advisory council consisting of the chiefs and tribal representatives from the native reserves which meets usually each year under the presidency of the resident commissioner. European residents are represented by a European advisory council, consisting of seven elected members under the presidency of the resident commissioner, which is usually in session twice a year. Resident Commissioner, Capt. C. N. A. Clarke.

BEETLES. See ENTOMOLOGY, ECONOMIC.

BELGIAN CONGO. See CONGO, BELGIAN.

BELGIUM. A kingdom of Western Europe. Capital, Brussels. Ruler in 1939, King Leopold III, who succeeded to the throne Feb. 23, 1934.

Area and Population. Area, 11,775 square miles. Population, estimated at 8,386,000 on Dec. 31, 1938. Births in 1938 numbered 130,604 (15.6 per 1000); deaths, 108,682 (13.0); marriages, 61,402 (7.3). Estimated populations of the chief cities on Dec. 31, 1937, were: Brussels and suburbs, 910,154; Antwerp, 274,406; Ghent, 163,378; Liège, 161,834; Mechlin, 62,324; Deurne, 55,957; Borgerhout, 54,174; Bruges, 51,773.

Colonial Empire. See CONGO, BELGIAN.

National Defense. In 1938 Belgium had a standing army of about 86,000 men and 4600 officers. Of these 33,000 comprised the regular army recruited by voluntary enlistment and the rest were conscripts. Under the Military Law of 1937 conscripts are called up annually for terms of 12 and 17 months. They then serve 15 years in the regular army and reserve and 10 years in the territorial army. Total reserves in 1939 amounted to 800,000, but equipment to arm them all was lacking. The air force comprised about 500 planes and 400 pilots. There was no navy. On Sept. 1, 1939, Belgium had mobilized about 170,000 men and this force was increased to over 500,000 by the year end. See *History*.

Education and Religion. Infant, primary and adult elementary schools numbered 13,461 with 1,234,573 pupils on Jan. 1, 1938. There were 252 secondary schools with 79,203 students on Jan. 1, 1937, and 10,775 students in 4 universities (1937-38). A majority of those Belgians professing a religion are Roman Catholics. There is full religious liberty.

Production. One of the most densely populated countries of Europe, Belgium exists mainly by manufacturing, mining, agriculture, and commerce. Production of the chief crops in 1938 was (in metric tons): Wheat, 547,900; barley, 89,200; rye, 385,000; oats, 621,100; potatoes, 3,258,400; beet sugar (1938-39), 174,700; tobacco, 4800; linseed, 16,100. Livestock on Jan. 1, 1938, in-

cluded 1,710,037 cattle, 871,556 swine, and 264,464 horses. The 1938 output of the sea fisheries was 39,100 metric tons valued at 123,300,000 Belgian francs.

The 1938 mineral and metallurgical output was (in metric tons): Coal, 29,575,400; briquets, 1,702,470; coke, 4,703,120; pig iron and ferroalloys, 2,465,000; steel ingots and castings, 2,285,000; copper (smelter), 90,300 in 1937; lead (smelter), 84,600; zinc (smelter), 210,000. Leading manufactures include window and plate glass, paper and cardboard (235,000 metric tons in 1937), cement, cotton yarn, rayon, metal articles, brewery products, furniture, and other wood products.

Foreign Trade. Imports of Belgium and Luxembourg in 1938 totaled 23,165,507,000 paper francs (27,892,782,000 in 1937); exports, 21,723,853,000 (25,516,225,000). Of the 1938 imports, France supplied 3,325,802,000 francs; Germany, 2,598,563,000; United States, 2,559,332,000; Netherlands, 2,079,300,000; Belgian Congo, 1,933,287,000; United Kingdom, 1,835,820,000. Of the exports, France took 3,360,415,000 francs; United Kingdom, 2,972,291,000; Germany, 2,654,497,000; Netherlands, 2,614,454,000; United States, 1,442,053,000. See IMPORTS AND EXPORTS.

Finance. Budget estimates for 1939 placed ordinary receipts at 11,482,737,000 francs and expenditures at 11,583,061,000. The internal debt on Dec. 31, 1938, was 35,091,000,000 francs; external, 14,150,000,000 francs; total, 49,241,000,000 against 55,762,000,000 on Dec. 31, 1937. The unit of currency for foreign exchange transactions is the belga, equal to five paper francs. Belga averaged \$0.1689 in 1938 and \$0.1685 in 1939.

Transportation. Main line railways in operation in 1938 extended 3189 miles; operating receipts for 1938 were 2,542,000,000 francs, expenditures 2,713,000,000 francs. Highways extended 20,244 miles in 1939 (see ROADS AND STREETS). About one-fourth of the total merchandise traffic was carried on navigable rivers and canals; the waterways network was extended in 1938 by completion of the important Albert Canal (see History). Traffic statistics of the Belgian commercial air system (SABENA) in 1938 were: Route-miles, 2907; miles flown, 1,557,706; passenger-miles, 8,259,729; freight ton-miles, 174,976; mail ton-miles, 51,562. SABENA'S operating mileage in August, 1939, including lines to and in Belgian Congo, aggregated 8313 miles. A total of 17,815 vessels of 29,963,052 tons entered Belgian ports in 1938.

Government. Executive power is exercised by the King through a ministry responsible to Parliament. There is a Senate of 167 members and a Chamber of Deputies of 202 members, all elected for four years. Deputies are elected directly by universal male and restricted female suffrage. Of the Senators, part are elected by direct suffrage and part are chosen indirectly by the provincial councils. Premier at the beginning of 1939, Paul Henri Spaak (Socialist), heading a Catholic-Liberal-Socialist coalition ministry. For 1939 developments, see History.

HISTORY

The dread shadow of war loomed ever more threateningly over Belgium throughout 1939, greatly impairing the national economy and forcing both people and parties to sink their political differences and present a united front to internal and external dangers.

Political Developments. The heated controversy among the government parties over social and financial policy (see 1938 YEAR BOOK, p. 87-88) weakened the Spaak Government and contributed to its collapse early in 1939. Premier Spaak's downfall, however, came over his appointment of Dr. Adrian Maertens to a seat in the Flemish Academy of Medicine on February 1. Dr. Maertens was a Fleming who had been convicted of treasonable acts during the World War. His appointment, approved by a margin of only two votes in Parliament, precipitated violent protest demonstrations in Brussels during which the Premier himself was roughly handled by enraged war veterans. Shortly afterward an ultimatum presented by the Liberals forced the resignation of the cabinet (February 9). On the same date Parliament adjourned *sine die*.

After ex-Foreign Minister Henri Jaspar (Catholic), the King's first choice, had failed to form a new government, Senator Hubert Pierlot (Catholic) announced a Catholic-Socialist coalition cabinet, including non-party men, on February 21. It lasted only six days before a Catholic-Socialist clash over financial measures caused its resignation—held in abeyance pending the formation of a new ministry. The King was unable to find any leader capable of forming a stable cabinet and accordingly, at the request of the Pierlot Cabinet, dissolved Parliament on March 6 and called new elections for April 2. At the same time he addressed a letter to Premier Pierlot bluntly accusing the political parties of shirking their responsibilities, disregarding constitutional principles, and failing to respect the separation of governmental powers.

Elections. The Maertens incident had revived the old quarrel between Flemings and Walloons and the political campaign at first promised to widen the breach between the Flemish- and French-speaking sections of the country. However the German annexation of Bohemia and Moravia on March 15, coupled with a violent Nazi-directed agitation in Eupen and Malmédy for the return of these frontier Belgian districts to the Reich, aroused fear among the Belgians that they might suffer the fate of Czechoslovakia. The Flemish-Walloon issue was dropped with the resignation of Dr. Maertens from the Academy of Medicine and the elections proved a successful test of national unity.

The standing of the parties in the new Chamber of Deputies, with the former standing in parentheses, follows: Catholics, 73 (64); Socialists, 64 (70); Liberals, 33 (23); Flemish Nationalists, 17 (16); Communists, 9 (9); Rexists, 4 (20); independents, 2 (2). In the Senate the comparative standings, after the direct and indirect elections, were: Catholics, 62 (57); Socialists, 61 (66); Liberals, 25 (19); Flemish Nationalists, 12 (9); Rexists, 4 (12); Communists, 3 (4). With the exception of the slight gains made by the Flemish Nationalists, the elections thus showed a decided swing from the extremist to the old, middle-of-the-road parties. A most significant aspect of the election was the virtual elimination of the Rexists (Fascists) under Leon Degrelle, a disciple of Adolf Hitler's, whose candidates had registered startling gains in the 1936 elections. The Nazis in Eupen and Malmédy failed to elect a deputy, although polling nearly half of the vote in those districts, and the newly organized Walloon party made a poor showing.

Cabinet Reconstructed. Although the Catholics and Liberals together now held a small majority in the Chamber, King Leopold asked Premier Pierlot to reconstruct his cabinet to include the Socialists. The Socialist party, however, voted 310,000 to 248,000 against participation in the government. Consequently Pierlot on April 18 formed a government consisting of 6 Catholics, 4 Liberals, and 3 non-party members. In his ministerial declaration, Premier Pierlot committed his government to reconciliation of Flemings and Walloons and maintenance of the belga at its existing level. Emergency powers for strengthening the national defenses and national economy were granted the government by the Chamber on April 26.

The election and its aftermath served to check the monetary and financial crisis that developed as a result of political events during the first quarter of the year. This was marked by an important flight of capital, severe pressure on the belga (which forced the National Bank to pay out some 2,000,000,000 francs of its gold stock and more than 1,000,000,000 francs of its foreign-exchange holdings to prevent depreciation), and the revival of demands for further devaluation.

In the interval before the outbreak of the European war on September 1, the Pierlot Government was engaged in strengthening Belgium's armed forces and defense works along the German border. The Senate on April 29 rejected, 146 to 11, a Flemish Nationalist proposal for intensive fortification of the Franco-Belgian frontier. At Socialist insistence the government also undertook to curb German propaganda in Eupen, Malmédy, and the Flemish districts.

Albert Canal Dedicated. An outstanding event of the year, from the viewpoint of both national defense and economic development was the dedication of the giant 80-mile Albert Canal on July 30 when King Leopold unveiled a statue of his father at the head of the canal in the outskirts of Liège. The project for linking Antwerp and Liège with a canal enabling 2000-ton seagoing ships to take iron ore and other materials directly to the Liège steel district was started by King Albert in 1930. Its completion, scheduled for July, 1939, was postponed several months by a washout in June. The new waterway gave Antwerp a great advantage in its competition with Rotterdam for the shipping trade of southeastern Belgium, Alsace-Lorraine, and northeastern France. It was also designed to present a formidable obstacle to German invasion through the Netherlands. The banks were heavily fortified and a system of defensive flooding made it possible for the Belgians to inundate large areas adjoining the canal within a few hours.

Foreign Policy. The Brussels Government continued throughout 1939 its efforts of previous years toward European economic appeasement and peace (see 1938 YEAR BOOK, p. 88). On May 23 Queen Wilhelmina arrived in Brussels to return King Leopold's official visit to The Hague in 1938. In a statement on foreign policy before the Chamber on June 9 Premier Pierlot said that Belgium had no intention of concluding a military alliance with Holland or leaving the League of Nations, but that the government reserved the right to abandon its neutrality policy whenever national interest demanded it. He asserted that the country would not resort to war unless attacked or unless its vital interests in either Europe or Africa were threatened.

Oslo Powers Conference. Before the German-Polish controversy plunged Europe into war, the Belgian Government on August 21 urgently invited the Netherlands, Finland, Luxembourg, Norway, Sweden, and Denmark to discuss their mutual problems of preserving neutrality and maintaining their food and raw material supplies. Representatives of the seven states met in Brussels beginning August 23. That evening King Leopold broadcast by radio an appeal for the preservation of peace drafted by the Foreign Ministers of the participating powers. The conference disbanded on August 24, leaving a permanent committee in session in Brussels to work out joint economic measures for preserving their neutrality. Up to the end of 1939, tangible results of this effort at neutral collaboration were not apparent.

Belgian-Dutch Collaboration. However Belgian collaboration with the Netherlands became increasingly close and the idea of a defensive Belgian-Dutch alliance, uniting their economic and military forces, gained wide support. On August 29 King Leopold and Queen Wilhelmina in joint messages to the German, Polish, British, French, and Italian governments offered to mediate the issues threatening Europe's peace. The offer was not accepted.

Once the great powers had declared war, the Brussels Government, fearing that Germany would repeat its World War tactic and strike at France through Belgium to outflank the Maginot Line, immediately mobilized nearly half a million troops and made every preparation to resist invasion. A neutrality proclamation was issued September 5. German, British, and French planes that occasionally flew over Belgian territory were fired upon by anti-aircraft guns or attacked by Belgian military planes.

Although the belligerents at the outset of the war all gave Belgium formal assurances that they would respect its neutrality, the danger of a German invasion mounted as the war progressed. There were heavy concentrations of German troops along the Belgian-Dutch frontiers coincident with accusations in the Nazi press that the two countries were unneutral in failing to resist more effectively the British blockade. Fear of imminent attack was believed to have inspired the second formal offer of their good offices in bringing the war to an end, issued on November 7 by King Leopold and Queen Wilhelmina after Leopold had arrived suddenly and unexpectedly at The Hague. On his return to Belgium the next day King Leopold called an emergency cabinet meeting, reportedly to consider a defensive military alliance with the Netherlands.

The rejection of this second mediation offer was followed on November 12 by a surprise conference of the Belgian and Dutch Foreign Ministers at Breda on the Netherlands side of the frontier. On November 21 King Leopold and Foreign Minister Spaak paid another visit to the Dutch capital. Two days later the two governments made separate protests against the extension of the Anglo-French blockade to include German goods exported through neutral countries. Some confirmation of a Belgian-Dutch defensive accord was seen in Foreign Minister Spaak's statement before the Chamber of Deputies on December 19 that "Belgium would never be indifferent should the independence of the Netherlands be threatened." Meanwhile King Leopold, in a radio address of October 26 to the United States, appealed for

American support and encouragement "in the attitude we have adopted for the good of peace in the service of civilization."

Economic Effect of War. Belgian trade and industry, which had shown an upward trend during July and August, were disorganized by the establishment of the Franco-British blockade and the mobilization of nearly 500,000 men. The German submarine, mine, and air warfare upon Allied and neutral shipping around the British Isles inflicted another severe blow upon Belgium's vital foreign trade. Stocks of foodstuffs, raw materials and other commodities were reduced and prices rose. Despite the large number of men called to the colors, there was a substantial increase in general unemployment.

To meet this emergency the government issued a series of decrees curbing price rises and profiteering, conserving food and raw material supplies through an import- and export-licensing system, and requiring extension of the cultivation of wheat, rye, sugar beets, and potatoes. Negotiations were also initiated with Great Britain, France, Germany, and the United States in an effort to assure continuance of as large a volume of foreign trade as possible. But the end of the year found the Belgian people suffering definite war privations. To make matters worse the Belgian Government was compelled to contribute heavily to the support of more than 25,000 Jewish refugees from Germany and Austria, three-fourths of whom were without means of support. In mid-December the government reached an agreement with Britain and France permitting food imports in quantities normally imported before the war without submission to the Allied blockade regulations.

See FRANCE, GERMANY, GREAT BRITAIN, and NETHERLANDS, *THE*, under *History*; FAIRS AND EXPOSITIONS.

BENEFACTIONS. Philanthropic giving increased about 25 per cent in 1939 over the previous year in the largest cities of the United States, according to a study conducted by the John Price Jones Corporation of New York. (The cities included in the study are New York, Chicago, Philadelphia, Boston, Washington, and Baltimore.) The increase is accounted for by a single gift—the presentation by Samuel H. Kress to the National Gallery of Art at Washington of a collection of paintings valued at \$25,000,000. If the Kress gift were deducted, the total would show a decline from 1938.

Of the various fields of philanthropy, foreign relief (see WAR RELIEF) showed the largest gain in the six cities, with publicly announced gifts of \$4,074,573 in 1939, as compared with \$588,595 in 1938. Gifts for education totaled \$20,594,224; health activities, \$3,903,653; recreation, \$253,102; religious activity, \$1,404,357. Gifts to the fine arts, apart from the Kress collection, showed an increase in 1939.

The accompanying table lists individual gifts and bequests of \$250,000 or more, as announced in United States newspapers and periodicals in 1939 and compiled in *Giving Today* (issued by the John Price Jones Corporation). The table excludes grants from the Rockefeller Foundation, the Carnegie Corporation, and the General Education Board, which are reported in the articles on those organizations. See also ART MUSEUMS; COMMUNITY CHESTS AND COUNCILS; EDUCATION; LIBRARY PROGRESS; RELIGIOUS ORGANIZATIONS; and articles on other philanthropic groups, as the RED CROSS.

National Gallery of Art: Gift of 375 paintings and 18 pieces of sculpture appraised at \$25,000,000 from Samuel H. Kress.

Northwestern University: Gift of \$6,735,000 from the Walter P. Murphy Foundation for the establishment of an institute of technology.

George F. Harding Art Collection: A collection bequeathed to the people of Chicago by George F. Harding, valued at \$5,000,000 and including, in addition, the medieval castle in which it is housed.

Guggenheim Foundation: Bequest of \$5,000,000 from Murry Guggenheim.

John Sealy Hospital: Bequest of \$4,000,000 from Mrs. Jennie Sealy Smith, Galveston, Texas, representing the balance of her will.

University of Chicago: Bequest valued at \$3,500,000 from Albert D. Lasker of Chicago.

University of Texas: Bequest of \$2,500,000, the residue of the estate of Will C. Hogg of Houston, for a foundation to bring distinguished lecturers to the University.

University of Chicago: Bequest of \$2,000,000 for medical education and research from Orson C. Wells.

Yale University: Bequest of \$1,800,000 from Edward Cobb.

Johns Hopkins University: \$1,500,000 estate left by John Martin Vincent, retired Professor of History.

J. W. Van Dyke Scholarship Foundation: An educational fund for children of employees of the Atlantic Refining Co., set up by a bequest of \$1,500,000 from John Wesley Van Dyke of Philadelphia.

Northwestern and Chicago Universities: Gifts of \$1,500,000 and \$1,000,000 respectively announced by the trustees of the estate of Clara A. Abbott, Evanston, Ill.

Rensselaer Polytechnic Institute: Three professorships established in recognition of gifts from the late Mrs. Russell Sage (\$1,250,000), the late Mrs. Robert W. Hunt (\$200,000), and Mrs. R. J. C. Walker (\$220,000).

Yale University: Bequest of \$1,250,000 from Hugh Campbell of St. Louis, who died in 1931 (will upheld in Circuit Court, June 20, 1939).

Emory University: Gift of \$1,000,000 from Samuel C. Dobbs of Atlanta.

Jewish Education Committee of New York: Gift of \$1,000,000 from the Friedsam Foundation, for religious instruction among Jewish youth.

Odd Fellows' home for Orphans and Aged Members at Elkins: Gift valued at \$1,000,000 from Miss Laura Amos and her two brothers of Farmington, W. Va.

Portland, Oregon, Public Schools: Gift of \$1,000,000 from Samuel Bissinger for handicapped children.

Presbyterian Church in the United States: Bequest of \$1,012,573 from Charles K. Smith of Philadelphia, released by the death of his son. The Woodmere Art Gallery received \$286,586 by the will.

Wilmington Hospital: A \$1,000,000 fund for a hospital for crippled children from the Nemour Foundation established by Alfred I. du Pont.

Yale University: \$1,000,000 trust fund established by Mrs. Ellen Battell Stoeckel for the study of music, art, and literature.

Harvard Law School: Bequest of \$700,000 from Augustus G. Cobb of New York, who died in 1930 and willed the income from his estate to his brother for life.

Johns Hopkins University: Gift of \$650,000 in the will of Alfred Jenkins Shriver of Baltimore, for a lecture hall.

Yale University: Bequest of \$525,000 from Frank Miner Patterson of New York, for needy and deserving students.

Cleveland Museum of Art: Bequest of \$500,000 from Mrs. Julia Morgan Mariatt of Cleveland.

New England Deaconess Association and Deaconess Hospital (Spokane): Bequest of \$500,000 and \$300,000 respectively from Theodore Chamberlin.

Western College for Women, Oxford, Ohio: \$478,500 received when the will of Edward Hidden of St. Louis was upheld in the Circuit Court. By the same will Yale University received \$159,500.

Hahnemann Medical College and Hospital: Gift of \$450,000 from Mrs. Emilie Foster Klahr in memory of her husband.

American Academy in Rome: Bequest of \$400,000 from the estate of Charles F. McKim left in trust to his daughter in 1909.

Boston Museum of Fine Arts: Gift of a collection valued at \$400,000 from Mr. and Mrs. Maxim Karolik of Newport, R. I.

Centre College of Kentucky: Bequest of \$400,000 from Guy Easton Wiseman, Danville, Ky.

Metropolitan Museum, N. Y.: Bequest of \$400,000 from Mrs. Edith Perry Chapman of Elmira, N. Y.

Wellesley College: Bequest of \$380,000 from Alice Cheney Baltzell of Dover, Mass.

Ball State Teachers College, Muncie, Ind.: Gift of \$375,000 from the Ball families for a men's residence hall.

Alfred P. Sloan Foundation: Grants of \$367,520 to 10 institutions, to be devoted mainly to popular economic education.

Memorial Art Gallery, Rochester, N. Y.: Bequest of \$365,000 from Hannah G. Gould of Rochester.

Worcester Polytechnic Institute: Gift of \$350,000 from the George I. Alden Trust for a student activities building.

University of Rochester: Bequest of \$319,000 from Francis R. Welles for a woman's dormitory.

Art Associates (sponsoring the Masterpieces of Art at the N. Y. World's Fair): Gift of \$300,000 from Mrs. George de Cuevas.

New England province of the Society of Jesus: Gift of 400 acres of land and buildings valued at \$300,000 in Lenox from Edward Cranwell of New York for the establishment of Cranwell Academy, a Jesuit preparatory school.

Queeny Foundation: A foundation established by the children of John Francis Queeny with the gift of Monsanto Chemical stock valued at \$300,000.

Princeton University: Bequest of \$275,588 from Mrs. Mirah R. Stewart, to be used in a Henry Clay Stewart Endowment Fund for young men from the District of Columbia.

Tusculum College: Gift of \$275,000 from Cyrus McCormick, San Bernardino, Calif.

Johns Hopkins Hospital: Bequest of \$263,000 from Harriet S. Lederer of Baltimore.

Rhode Island Hospital: Bequest of \$250,000 from Col. Joseph Samuels to expand the dental clinic he had previously given.

Roosevelt Hospital, N. Y.: Gift of \$250,000 made by Edward S. Harkness on condition that the Hospital raise the \$2,967,000 needed.

University of Oregon: Bequest of \$250,000 from Mildred Anna Williams of New York, who also left \$220,000 to the Community Trust.

BEREA COLLEGE. A nonsectarian coeducational institution in Berea, Ky., founded in 1855 and designed to serve the educational needs of the mountain people of the Southern Appalachian region. The enrollment for the autumn of 1939 was 1791, distributed as follows: College of arts and sciences, 813; secondary school and below, 925; nurses 53. The enrollment in the summer session of 1939 was 266. The faculty numbered 119. The endowment amounted to \$10,176,265 and the income for the year ending June 15, 1939 was \$584,147. The library contained about 81,000 volumes. President, Francis S. Hutchins, LL.D.

BERGDOLL CASE. Grover Cleveland Bergdoll, a wealthy Philadelphian of German extraction and sympathies, evaded the military draft in 1918; was caught in 1920, convicted by a military court as a deserter, and sentenced to prison for five years; escaping after his sentence, he took refuge in Germany.

On May 25, 1939, Bergdoll, facing steps on the part of the Government to carry out the confiscation of assets that he had in the United States, arrived at New York by the liner *Bremen*, to surrender and face charges. He was tried at Governors Island on a second charge, relating to the desertion involved in his escape of 1920, and sentenced to an additional three years of prison. The Government thereafter offered to return to him 80 per cent, or about \$300,000, of seized property.

Bergdoll maintained that he had never been formally enlisted as a soldier and that he had evaded service because of conscientious objections. According to his testimony, corroborated by that of other witnesses, including his German wife, he had made several trips to the United States during the years when he was supposed to be living in Germany.

BERMUDA. A British crown colony in the North Atlantic, 677 miles southeast of New York. It comprises some 360 small islands of which 20 are inhabited. Area, 19.3 square miles; civil population (Mar. 26, 1939 census), 30,814 (11,481

white, 19,333 colored). Chief towns: Hamilton (capital), 3259 inhabitants; St. George, 1000. During 1938 there were 769 living births (24.4 per 1000) and 332 deaths (11.4 per 1000). Pupils registered in the schools in 1938 totaled 4723, and the average attendance was 85 per cent. Bermuda is the headquarters for the West Indies and Atlantic Squadron of the British Navy.

Production and Trade. Agriculture, with the exception of the tourist trade, is the chief industry. There are about 1000 acres of farming land under arable cultivation and most of it bears from two to three crops a year. The main crops consist of potatoes, onions, lily bulbs, cut flowers, and green vegetables. Bananas and arrowroot also are grown. During 1938, a total of 82,062 tourists visited Bermuda. In the same year the shipping that entered and cleared the colony aggregated 6,441,284 tons. Pan American Airways and Imperial Airways carried 5515 passengers during 1938 in the Bermuda-United States service. In 1938, imports were valued at £1,906,688; domestic exports, £51,003; re-exports, £94,940. There were (in 1938) 102 miles of roads.

Government. For 1938, revenue totaled £460,002; expenditure, £452,072. On Dec. 31, 1938 the public debt totaled £75,000 against which the sinking fund was £50,212. The colony is administered by a governor, assisted by an executive council of 7 members. Legislation is enacted by a legislature composed of the governor, a legislative council of 9 members (3 official and 6 nominated unofficial), and an elected house of assembly of 36 members (4 elected from each of the 9 parishes). Each voter must own freehold property of \$300 in value. Governor and Commander-in-Chief, Maj.-Gen. Sir D. J. C. K. Bernard (assumed office, Oct. 9, 1939).

History. On Jan. 21, 1939, the Imperial Airways flying-boat *Cavalier*, in service between New York and Bermuda, was lost at sea after making a forced landing. Three of the 13 people on board lost their lives. Because of the seriousness of the political situation in Europe the Acting Governor assented (Aug. 24, 1937) to the Emergency Powers Act which had been rushed through the legislature. He said that a state of national emergency existed and thus invoked the full powers of the act to govern by regulations which included conscription for the defense of the islands.

BESSARABIA. A province of Rumania (since Apr. 11, 1918), formerly a government of Russia. Area, 17,146 square miles; population (July 1, 1937 estimate), 3,110,654. Capital, Chisinau (Kishenev), 117,101 inhabitants in 1937.

BIBLE SOCIETY, AMERICAN. Organized in 1816, this society has steadily carried forward its specific purpose of "circulating the Holy Scriptures without note or comment" and without discrimination as to class, color, or creed. Bibles, Testaments, and Portions are sold without profit and below cost or donated free when circumstances justify. During the 123 years of its existence, the society has issued 290,663,685 volumes and participated in the translation, publication, and distribution of the Scriptures in nearly 300 languages, dialects, and versions.

The work in the United States is carried on through 11 home agencies and some 100 auxiliary, State, and local Bible societies. Latin America and the Near East and Far East are covered by 12 additional agencies, while correspondents help carry on the work in other countries, especially in Europe and Africa. During 1938 the society

issued 6,970,757 volumes in 174 languages, including 6337 volumes for the Blind. The number issued in the United States was 3,370,563, and in foreign lands, 3,600,194. Engaged in this distribution were 3425 agency secretaries, sub-agents, colporteurs, correspondents, and volunteers.

The budget of the society for 1939 was \$958,931. The officers were John T. Manson, president; the Rev. Eric M. North, D.D., and the Rev. Frederick W. Cropp, D.D., general secretaries; the Rev. Francis Carr Stifler, D.D., recording and editorial secretary; Mr. Rome A. Betts, associate secretary, Rev. James Oscar Boyd, assistant secretary, and Gilbert Darlington, treasurer. Headquarters of the society are in the Bible House, Park Avenue & 57th Street, New York City.

BIOLOGICAL CHEMISTRY. The selection of papers from which this review has been written has again this year been a difficult task. The year has witnessed no slackening of the pace of publication of experimental data, and the field has become so fertile that in limited space a complete survey is impossible. It can be stated, conservatively, that the subject continues to expand and many important developments have been reported. Especially is this true in the field of the vitamins.

Stiller, Keresztesy, and Stevens have completed the determination of the structure of Vitamin B₆ and have shown it to be 2-methyl-3-hydroxy-4,5-di-(hydroxymethyl)-pyridine. This structure has also been confirmed by Kuhn. The Merck investigators have also synthesized this compound by a series of reactions starting with the condensation of ethoxyacetyl acetone and cyanoacetamide. The substituted pyridone so obtained was then nitrated and the nitro-derivative treated with phosphorus pentachloride. Reduction of this product gave 2-methyl-3-amino-4-ethoxymethyl-5-cyano-6-chloropyridine. Treatment of this compound with hydrogen in the presence of platinum produced a substance which on diazotization with nitrous acid gave the corresponding 5-hydroxymethyl pyridine. When this compound was hydrolyzed with concentrated hydrobromic acid a dibromide was obtained which on treatment with silver oxide in the presence of silver chloride gave the hydrochloride of Vitamin B₆, a compound identical in all its properties with the hydrochloride of the natural vitamin.

It is to be recalled that this vitamin is that factor of the Vitamin B complex which prevents or cures acrodermatitis. Lack of it has also been found to produce microcytic hypochromic anemia. Birch has suggested that the physiological function of Vitamin B₆ is connected with utilization of the unsaturated acids. It has also been reported that if this vitamin be added to the usual Vitamin B₁ or Vitamin B₂ supplement it not only produces a cure of the dermatitis but also stimulates growth.

On page 90 of THE NEW INTERNATIONAL YEAR BOOK for 1937 this reviewer reported that increasing attention had been given to the anti-hemorrhagic vitamin designated as Vitamin K. This new substance which last year was in the process of gradual evolution now finds itself the center of very exciting and highly competitive investigations. First isolated by Doisy from alfalfa it can now be stated with certainty that it is a light yellow oil which changes into a crystalline condition

on crystallization from cold acetone or alcohol. On the basis of its degradation products Doisy has shown that its structure is 2-methyl-3-phytyl-1,4-naphthoquinone. Similar conclusions have also been reached by Fieser and his students, and by Almquist and Close. On the basis that this natural vitamin is a naphthoquinone, several laboratories announced almost simultaneously the synthesis of substituted quinones having anti-hemorrhagic activity. In fact the chemical properties and absorption spectra of these synthetic model compounds and the marked anti-hemorrhagic activity of one of them in particular (2,3-dimethyl-1,4-naphthoquinone) gave strong support to the view that the natural vitamin was a substituted naphthoquinone. The names of Doisy, MacCorquodale, Fieser, Almquist, Close, and Fernholz are associated with this work.

Confirmation that the structure of this vitamin is as proposed above has been submitted in the form of its synthesis both by Doisy and by Fieser. Starting with the monosodium salt of 2-methyl-1,4-naphthohydroquinone the vitamin was prepared by the condensation of this metallic derivative with phytyl bromide. It was isolated in the form of its diacetyl dihydro-derivative and the synthetic compound so obtained was degraded by the same procedure as used for the natural vitamin. By using a large excess of methyl naphthohydroquinone to accelerate the bimolecular condensation reaction and by operating at a temperature (75°C) where cyclization is slow it is possible to produce considerable amounts of the phytyl substituted hydroquinone. In concluding the review on the work of this particular vitamin it should be pointed out that most of the investigators have assumed that in the isolation of this compound from natural sources such as alfalfa meal, there has been no change in the structure during the isolation process. This may or may not be true. It will be recalled that during investigations on Vitamin E it was first believed that this compound was a quinone derivative. Further work, however, showed it to be a chromone type of compound. Experience gained from this work would suggest that here also in the case of Vitamin K₁ there are interesting possibilities of such a type of structure.

Doisy has also announced the isolation of a second vitamin designated by him as Vitamin K₂. Whereas Vitamin K₁ at room temperature, is a light yellow oil, Vitamin K₂ as isolated from sardine meal is a light yellow crystalline solid of a melting point 51-52°. Various preparations of this compound have shown uniformly a potency of approximately 600 units per milligram. It will be recalled that the potency of Vitamin K₁ is 1000 units per milligram. Doisy is of the belief that this second vitamin is also a quinone since it forms a diacetate of the dihydro-derivative. The melting point of this diacetate is 60° and evidence has been submitted to show that in reality it is a 2,3-disubstituted naphthoquinone, with six double bonds in the side chain.

Before concluding this phase of the review of the year's work the results of certain other investigations should be noted. An anti-gray hair vitamin, a new factor of the Vitamin B complex is claimed to have been isolated by Lunde and Kringstad. In the past several authors have claimed the existence of a rat-growth filtrate, the lack of which causes the black fur of the rat to turn gray. The above authors believe, however, that the anti-gray hair factor, called by them B₁₁,

is distinct from the "filtrate"-growth factor called B_{12} . This new B_{12} factor, for example, is soluble in phenol and is more heat labile than the other factors belonging to the "heat stable" group of the Vitamin B complex. They report that it is found in brewer's yeast and especially in the livers of mammals. In this same connection, Emerson and Evans report that in an attempt to purify the "filtrate factor" they have obtained evidence that this factor must consist of at least two entities. One of which can be extracted from acid solution by ether, while the other factor remains in the residue. They are of the opinion that their present work indicates that the "anti-graying" activity belongs with the ether-soluble component. Jukes has also reported certain facts concerning this vitamin which are of interest. He finds that its activity is destroyed in alkaline solution at 100° , but that it is stable in alkali at room temperature. He also finds that in acid solution its activity is completely destroyed with potassium permanganate. In the opinion of this reviewer these facts would suggest that perhaps we are dealing with a compound which is an α - β -unsaturated ketone. There are investigators who are of the belief that this factor is identical with that previously called the "chick anti-dermatitis" factor. This may or may not be true. At any rate, the "chick anti-dermatitis" factor appears to be very similar to pantothenic acid, a vitamin now being studied by Williams, and whose molecule is known at the present time to contain one carboxyl group, two hydroxyl groups and probably a substituted amide group, since β -alanine is one of its cleavage products.

Other facts concerning the behavior of this acid have been reported. Williams finds, for instance, that it appears to be synthesized by yeast only when β -alanine is present in the culture medium. According to the experiments of Reichstein obtained from rats which have been fed on a diet deficient in this filtrate factor, it would appear that β -alanine is the essential part of the whole molecule of pantothenic acid, since rats react in a wholly similar manner to both β -alanine and to pantothenic acid. This view is supported by the interesting fact that a product has been synthesized by Subbarow and Rane which is able to replace pantothenic acid in an otherwise chemically defined medium. The compound is made by the condensation of β -alanine ethyl ester with the acid chloride of α , δ -diacetoxy valeric acid. The only difference in its behavior which was noted was that the synthetic product was needed in somewhat larger amounts.

In 1938 this reviewer reported that a very outstanding advance had been made in chemotherapy in the discovery of the utilization of sulfanilamide in the treatment of a variety of bacterial infections. The work, this year, has consisted mainly in the preparation of derivatives of this highly important substance, and in the investigation of their physiological activity from this point of view. Of interest in this connection are the results of Adams *et alia* who have prepared a variety of p -acylamidobenzene-sulfonamides. Although all show less anti-streptococcal activity than sulfanilamide itself, practically all of them are much less toxic. The anti-meningococcal activity of many of them has also been studied, and results indicate that in many cases it is equivalent to that of sulfanilamide.

Crossley and co-workers have made certain pharmacological studies on N^1 - N^4 -diacylsulfanila-

uide and N^1 -acylsulfanilamides. They report that in the case of N^1 -dodecanoylsulfanilamide results have been obtained which show that the compound is effective in mice, not only against infections by beta-hemolytic streptococci, but also in arresting the spread of tuberculosis infections.

The physiological activity of certain derivatives of 4-4' diamino diphenyl sulfone has been investigated. Raiziss and co-workers have found that diamino diphenyl sulfone itself is superior to sulfanilamide in its therapeutic effect. The aminohydroxysulfones and their acetyl derivatives are about equal to sulfanilamide in this property.

A marked advance has been made during the year in the discovery that compounds of the above type are effective in the treatment of various types of pneumonia. Especially is this true in the case of sulfapyridine. The mortality figure in adults has been greatly reduced. Many cures have been reported by the use of this compound. It has been found to be especially good when used in conjunction with the various sera. It has been reported that it is effective in a large number of cases of malaria. Other compounds are of interest in this connection. Sulfanilyl-sulfanilamide has been used effectively in at least one severe case of lobar pneumonia and septicemia, a disease which carries a mortality rate of 98 per cent. This compound does not influence, however, the clinical course of group IV pneumonia cases. It is potent, however, in the treatment of gonorrhea in the male. One investigator reports 94 per cent clinical cures in an average of ten days, and according to him the compound is 50 per cent more effective and 50 per cent less toxic than sulfanilamide itself. It also has been found that it is effective in the treatment of scarlet fever. The duration of fever was not only shortened, but the incidence of complications, etc., was decreased. It did not shorten, however, the duration of the rash. Finally it has been found that many types of gonorrhea resistant to sulfanilamide itself will respond promptly to sulfanilyl-sulfanilamide.

Other new types of compounds have been studied and have been found effective in the treatment of pneumonia. The mortality figure has been greatly reduced by the use of hydroxyethyl apocupreine. It has also been shown that this compound has no disturbing effect on the vision. In concluding this phase of this review it should be noted that compounds formed by substitution of the amide group (e.g. p -aminobenzene sulfonamidopyridine) are very effective in the treatment of experimental streptococcal, pneumococcal, and gonococcal infections. It has also been observed clinically that the acetyl and formyl derivatives of bis- p -aminophenyl sulfone are likewise effective against these infections.

Progress continues to be made in our knowledge of the proteins. On the theoretical side Neurath has developed a method for the estimation of the relative and absolute dimensions of protein molecules. The data indicate that most proteins are asymmetric in shape. He finds that when proteins are grouped on the basis of their molecular dimensions a certain regularity exists independent of the molecular weight. Comparison of the dimensions of proteins with their respective dissociation and aggregation products indicates that cleavage occurs only in directions parallel to either the major or minor molecular axis. A similar relationship holds for the absolute dimensions of the anti-pneumococcus serum globulins. These proteins seem to differ chiefly in respect

to the length of the molecule if the species from rabbit, man, and horse are compared with each other.

Work on the isolation of new crystalline proteins continues. Kunitz reports that he has isolated from beef pancreas a crystalline protein which acts as a powerful digestive enzyme for yeast nucleic acid. It is interesting to note that the digestion of the acid is accompanied by little, if any, release of inorganic phosphorus. Balls and Linerweaver have published a description of a method for the isolation of crystalline papain from papaya latex. They find that the enzyme is activated by cyanide compounds and by sulfhydryl compounds. It will digest hemoglobin with a velocity comparable to the pancreatic proteinases. It clots milk and hydrolyses hippuric acid amide. It is stable in dilute alkali up to a pH of 10.5 but it is unstable in dilute acids below 4.5. Alder, v. Euler, and Günther report that they have a flavoprotein in heart muscle which has all the properties of diaphorase.

The year has witnessed a notable advance beyond that achieved 30 years ago by the German scientist, Emil Fischer, in the synthesis of polypeptides of high molecular weight. Pacsu has reported that the hexapeptide ester of glycine undergoes condensation into the 96 and higher (3×2^n) peptide esters. It is of interest to note that this type of condensation is different from that exhibited by dipeptide esters, for if they were the same one would have expected that "cyclol 6" would have been formed. The experiments were carried out by heating the pure hexapeptide ester at a constant temperature of 102°. The results show that instead of cyclization the hexapeptide ester undergoes a type of condensation characteristic of the tripeptide ester. The high molecular weight polypeptide ester mixture so obtained is a colorless material of amorphous appearance. Its properties are similar to those of denatured proteins, and like many of the latter substances, the mixture is soluble in a concentrated solution of urea. It also gives a biuret reaction.

During the past year interest in the field of the carbohydrates seems to have increased. Hudson has continued his oxidation studies of the sugars with periodic acid. He and his co-workers report that oxidation of α , α -trehalose with periodic acid in aqueous solution, and subsequent oxidation of the product so formed with bromine water in a solution kept neutral with strontium carbonate, produces a 55 per cent yield of the crystalline strontium salt of oxybis (hydroxy-methyl diglycolate). The structure of this salt together with the two glyceric acid moieties in the molecule prove that each of the two glucose molecules of the trehalose molecule possesses the pyranose structure.

Pacsu and his students have continued their work on the ketone sugars. They have shown that Hudson's rules of isorotation hold closely in the *l*-sorbitose series provided certain constants are applied separately to the alpha and beta derivatives. The rotation of the alpha and beta isomers can be calculated by introduction of a factor *F* in the equation. It also has been found that the reaction between α -acetochlorosorbitose and methyl alcohol gives rise to an ortho ester, and only to a small amount of the true β -alkyl sorbitoside tetraacetate. Periodic acid oxidation has shown that both α -methyl and β -ethyl sorbitoside have the pyranoid ring structure. These investigators have also reported the synthesis of a new

dissaccharide, 1- β -glucosido-fructose. Since this synthetic sugar is entirely different from turanose this work, together with work previously published, shows beyond reasonable doubt that turanose must be 3- α -glucosido-fructose. Melezitose, therefore, is the corresponding sucrose derivative. The preparation of crystalline d-fructose dimethyl acetal in good yields and of β -methyl mannofuranoside and mannose dimethyl acetal has also been announced, and a new mechanism for the reaction of sugar acetals with alcoholic mercuric chloride has also been suggested.

Notable advances continue to be made in the field of sterols and hormones. Fernholz and Stavely for the first time have been able to prepare a dibromide of stigmaterol in which the two bromine atoms are in the 22 and 23 positions of the molecule. Marker has continued his studies on urane and its derivatives. Uranedione 11,20 and uranetriene 3,11,20 have been prepared. Catalytic reduction of the trione produced a uranediol, the ketone group at the C 20 position being completely reduced to the hydrocarbon. These investigators have also continued their analyses of pregnancy urine, and among the interesting facts obtained it can be noted that mare's pregnancy urine has been found to differ from other urine chiefly in the proportion of the three pregnanediols present, allopregnanediol-3 β , 20 α , being present in considerable amounts.

Wallis and his students have continued their studies on molecular rearrangements in the sterols and have established beyond doubt the structure of the isomeric ethers of cholesterol. From *i*-cholestanone, a ketone prepared from *i*-cholesterol itself, they have prepared a new dicarboxylic acid. This acid has been shown to be an isomer of a new acid obtained from β -3 chlorocholestanone-6. A third isomeric acid has also been prepared from α -3 chlorocholestanone-6. The existence of these isomers can only be explained on the basis of a cyclopropane bridge in ring A of the sterol molecule. These investigators have also continued their studies in the sitosterol complex. Experiments have been described which have a direct bearing on the structure of α_1 -sitosterol, and which strongly suggest that this sterol has two double bonds in positions 5-6 and 8-14 in the sterol molecule. They report that only one of the double bonds can be hydrogenated under ordinary conditions, and evidence is submitted which shows that α_1 -dihydrositosterol so obtained is an α -stenol. The second double bond can be isomerized by dry hydrogen chloride into a position which is easy to hydrogenate. This α_1 -isodihydrositosterol is a β -stenol. The isolation of a new sterol, α_1 -sitosterol, has been reported by these investigators. This sterol in all probability is an isomer of stigmaterol and titration with perbenzoic acid shows that two double bonds are present in the molecule. A further study of its structure is being made. Ladenburg, Fernholz, and Wallis have reported the results of their study on the separation of sterol esters by means of the chromatographic adsorption method. The sterol esters used were those of azobenzene monocarboxylic acid, and mixtures of sterols containing a different number of double bonds have been found, in accordance with the theory, to be easy to separate, the more double bonds the sterol has the stronger is its adsorption. The use of highly colored esters made the development of the chromatogram very easy to follow.

Much work continues to be published in the

field of the hormones. Mamoli has been able to convert (by the use of enzymes) certain pregnenolones into desoxycorticosterone. Butenandt has developed new methods for the transformation of dehydroandrosterone into progesterone. Serini by use of the acetylene reaction reports that he has finally been successful in preparing desoxycorticosterone from dehydroandrosterone. By means of yeast Wettstein has converted oestrone into oestradiol. Ehrhart has described experiments which show that in the presence of lead tetraacetate progesterone is oxidized to desoxycorticosterone. Bachman, Cole, and Wilds have announced the total synthesis of equilenin. To this reviewer, this is of great interest since it is the first time that the steroid skeleton has been synthesized, and the method of synthesis proves beyond all doubt that the second methyl group in steroids is at position 13.

Of unusual interest have been the recent reports of several investigators that patients with Addison's disease who were undergoing treatment with synthetic desoxycorticosterone develop cardiac insufficiency and die. It would thus appear that clinical tests have thrown great doubt on the value of this compound for medicinal use. After all signs of adrenalin insufficiency have gone, and even after the blood pressure has returned to normal, patients suddenly complain of rapidly progressing weakness, and, in some of the cases reported, have died within a short time.

Great progress has been made in the preparation of simple compounds having hormone activity. Dodds and co-workers have found that many derivatives of stilbene and diphenylethane containing phenolic hydroxyl groups are highly physiologically active. Diethylstilboesterol and its hydrogenated products may be mentioned in this connection. Diethyl stilboesterol itself shows marked oestrogenic activity. In several cases, however, in which it was used, unpleasant secondary effects, such as nausea or vomiting were produced. It has also been reported by Greene *et alia* that this compound when injected into a young white rat has marked effect on its sexual development. It has also been reported that this substance causes a decrease in weight of the thymus. This is similar to the effect of oestrone. Mühlbock, however, reports certain differences between the effects of oestrogenic hormones and diethyl stilboesterol. When this latter substance is smeared on the comb of the chicken no antagonistic action has been observed; the oestrogenic hormones, on the other hand, do produce these effects. It should be pointed out, however, that such differences, may be due to the fact that in the one case the substance is not resorbed.

Dodds has reported that the hydrogenation product of diethylstilboesterol is also very potent. This phenol produces an oestrus-response in rats when administered in doses of 0.20 per cent. Doses of 0.10 gave 20 per cent response.

In reviewing the work of the year in endocrinology, the experiments of Swingle and his students, in the opinion of this reviewer, are the most worthy of note. These investigators have continued their work on the extraction and purification of renin, which, it is to be recalled, is the pressor substance found in the kidney cortex. A fractional precipitation method employing salt and ammonium sulfate has been described. The final product obtained by them is a non-toxic pressor protein and is apparently a globulin. The protein retains its peculiar properties unimpaired

for long periods if kept frozen or if kept in the dry state as a powder under vacuum. This pressor principle is non-dialysable and is positive for all other standard protein tests. A unit has been established. This renin unit has been defined as the minimum amount necessary, when given intravenously over a period of 2 to 5 seconds, to raise the mean arterial pressure of anesthetized dogs an average of 40 mm. mercury above the starting pressure level. It is interesting to know that Swingle's preparation is non-toxic even when injected in doses of 35 mg.

Interesting experiments have been reported by Schoenheimer and co-workers in the field of protein metabolism. Experiments have been devised which offer proof of the ability of rats to utilize small amounts of ammonia for amino acid and creatin formation. They have also studied the biological hippuric acid formation in rats. When glycine preparations containing labeled nitrogen were used it was found that the glycine given with benzoic acid either by mouth or injections is utilized by the hippuric acid formation. However, only part of the administered glycine, even when given in excess, is used for this reaction; the major part is supplied by the animal tissues. Schoenheimer has also found that when a healthy non-growing rat is given the ordinary stock diet, and kept in nitrogen equilibrium, the nitrogen of at least one dietary amino acid, tyrosine, is only partly excreted in the urine, while most of the remainder is deposited in the tissue proteins. An equivalent of protein nitrogen is excreted. Only part of the deposited nitrogen remains attached to the original carbon chain of the tyrosine molecule. A considerable portion of the rest is used for the formation of other nitrogenous compounds, even of such amino acid molecules as were present in abundant amounts in the diet.

Again this reviewer must report that progress in cancer research is slow, although the attack continues to be vigorous. Of outstanding merit is the work of Kogl whose recorded observations suggest that the proteins of malignant tissues are partially racemized. From normal tissues Kogl has been able to isolate after short acid hydrolysis relative good yields of the usual *l*(+)-glutamic acid, whereas the products isolated from ovarian tumors and other mammary carcinomas gave rotatory values which show that they contain anywhere from 15 to 25 per cent of *d*(-)-glutamic acid. This, indeed, is most interesting and opens up a new field of study on the chemistry of malignant cells.

EVERETT S. WALLIS.

BIOLOGICAL SURVEY, BUREAU OF. In the U.S. Department of the Interior, the agency of the Federal Government concerned with the welfare of all forms of the country's resources in vertebrate wildlife, excepting fishes and marine mammals. To study the relations of birds to agriculture, the organization was established in 1885 under the Department of Agriculture, where it grew from sectional to bureau status. On July 1, 1939, in accordance with President Roosevelt's Reorganization Plan No. II, the Biological Survey was transferred to the Department of the Interior, which more than any other branch of the Federal government is concerned with the conservation of the country's natural resources. The Bureau is organized into nine divisions: wildlife research, land acquisition, wildlife refuges, Federal aid in wildlife restoration, game

management, construction and Civilian Conservation Corps operations, predator and rodent control, public relations, and administration.

Outstanding events of the fiscal year 1939 included the beginning of operations under the Federal Aid to Wildlife Restoration Act, which became effective on July 1, 1938. Under this Act Congress annually appropriates moneys to aid the States in conducting projects designed to benefit wildlife. Appropriations may not exceed the annual revenue from the 10 per cent excise tax on sporting arms and ammunition, which totaled almost \$3,000,000 last year. The initial appropriation to the Bureau was \$1,000,000; and for the fiscal year 1940, it was increased to \$1,500,000. The Federal Government pays 75 per cent of the cost of approved projects, while the State pays 25 per cent. At the close of the first year, 42 States had passed the necessary assenting legislation, 1 had a bill pending, and 5 were ineligible. Approvable projects had been submitted by 37 States.

Significant in its promise of future improvement in wildlife management is the establishment on June 3, 1939, of the Patuxent Research Refuge, Md., near the Nation's capital. On this study area, qualified biologists will investigate game and fur-animal management techniques and will train younger Bureau scientists in this work.

During the year 51 national wildlife refuges, with nearly 2,000,000 acres, were added to the Nation-wide network of sanctuaries. The Bureau now administers 266 refuges with an acreage of 13,620,128.

Saving important wildlife areas from needless drainage constituted an important phase of the Bureau's conservation program. Studies were continued in efforts to determine practical means for accomplishing mosquito control without resorting to destructive drainage of valuable wildlife areas.

Other highlights of the Bureau's work included the following: The annual midwinter migratory waterfowl inventory revealed an increase in almost all species of these birds, the total population being estimated at between 55,000,000 and 60,000,000. Nearly 500,000 game and other birds were banded, bringing the total banded since 1920 to more than 3,250,000. Then land-grant colleges maintained co-operative research units and trained graduate students in wildlife management. The second Nation-wide big-game inventory indicated that there are nearly 6,000,000 big-game animals in the country today. Two important studies on the food habits of North American game ducks were published.

Work continued on studies of fur animals in general. During the past year arrangements were completed for including in the decennial census, for the first time, questions pertaining to fur-animal production. Research on reproduction in minks and muskrats yielded important embryological information and facts of practical value, particularly in mink breeding. Wildlife-disease investigators engaged in a large-scale vaccination on fur farms and a study of the relation of duck foods to botulism.

Pest-control activities included studies to suppress water-chestnut, a plant that impedes navigation and lessens the value of an area to waterfowl and fishes. Some 104,000 predatory animals were taken in co-operative campaigns to protect domestic livestock, poultry, and game, while almost 35,500,000 rodent-infested acres were treated

to protect crops, range vegetation, and irrigation and soil-conservation structures.

The Civilian Conservation Corps established 34 camps on 33 wildlife refuges, where the personnel create marshes by impounding water, plant vegetation valuable to wildlife for food and cover, erect fences, and otherwise improve the areas.

Last year more than 1,000,000 migratory waterfowl hunting stamps were sold. This is a good indication of the number of waterfowl hunters. Enforcing Federal game laws are 44 U.S. game management agents and 22 U.S. deputy agents operating in 43 patrol districts.

BIRMINGHAM-SOUTHERN COLLEGE. A coeducational institution for higher learning in Birmingham, Ala., founded in 1856. The enrollment for the autumn of 1939 was 870 full-time students and 165 part-time students, and for the summer session 379. There are 62 faculty members. The endowment amounts to \$615,519, and the income for the year is \$261,364. There are 47,000 volumes in the library. A new Physical Education Building was to be built at a cost of \$100,000. President, Raymond Ross Paty, A.B., A.M., I.L.D.

BIROBJAN, *bě-rō-bī-jān'*. See JEWISH AUTONOMOUS PROVINCE.

BIRTH CONTROL. Birth control in the United States won increasing acceptance during 1939 as a tax-supported public health measure. From clinics financed by private charity, the trend of the movement is toward inclusion in health and welfare departments as an essential part of maternal and child health service. Forty per cent of the medically directed birth control centers of the United States in January, 1940, were supported in whole or in part by public funds, as compared with 18 per cent in January, 1937.

Two State Boards of Health now include contraception in their services. Following the adoption of birth control as a State public-health measure in North Carolina in 1937, South Carolina launched a similar program in 1939. In Minnesota, contraception is part of the medical budget of eight county welfare boards.

Throughout the United States at the end of the year, 162 birth control centers were located in health department quarters. Ninety-six additional centers in hospitals further reflected the trend toward public support. A total of 223 centers were supported in whole or in part by public funds.

Since the establishment of the first medically directed birth control center in the United States in 1923, the number has grown to 553 centers in 42 States, the District of Columbia, and territories. The greater part of these have been established in the last five years, only 150 centers being reported in January, 1935.

Through the doors of the centers passed in 1939 an estimated 75,000 women, who sought and received needed medical service, and some 165,000 others returned for further guidance and aid. Most patients at these centers can pay little or nothing. In addition, more than 15,000 mothers were reached through special rural service in 11 States. Indirectly, through referral to private physicians and through co-operating agencies, the Birth Control Federation of America

made reliable contraceptive advice available to many thousands more.

National Organizations Merge. The movement gained strength by the merger in January, 1939, of two national organizations, the American Birth Control League, of which Dr. Richard N. Pierson was president, with the Birth Control Clinical Research Bureau, directed by Mrs. Margaret Sanger, forming the Birth Control Federation of America, with headquarters at 501 Madison Avenue, New York. Its total membership is 22,000. State member leagues are directing birth control programs in 30 States and the District of Columbia. Three new State groups were organized during 1939 in California, Maryland, and Tennessee.

The officers of the Federation for 1940 are, Honorary Chairman, Margaret Sanger; President, Richard N. Pierson, M.D.; Vice Presidents, Robert L. Dickinson, M.D., Henry Pratt Fairchild, Ph.D., Frederick C. Holden, M.D., Clarence Cook Little, Sc.D., C.-E. A. Winslow, Dr.P.H.; Secretary, Mrs. Mary Woodard Reinhardt; Treasurer, Gilbert Colgate; General Director, Woodbridge E. Morris, M.D. A board of directors of 75 members includes a representative of each affiliated state league.

The Federation's budget for 1939 was \$150,000 derived mainly from contributions, which are tax-exempt. Its program includes organization of State and local leagues and establishment of birth control centers under medical direction; public education to demonstrate the health, economic and eugenic values of scientific birth control; medical education through medical colleges and medical societies and through publications for physicians. This program is carried out through field service and advice to member leagues and centers in problems of organization, public education, clinic administration, and finance.

Public Education. During the year millions of the general public read articles favorable to birth control in newspapers and periodicals. Several large-circulation magazines treated the subject for the first time and received from their subscribers many more letters favoring birth control than opposing it.

Exhibits and films on birth control were shown at some 300 gatherings of the general public and 102 meetings of physicians, including the American Congress on Obstetrics and Gynecology, American Public Health Association, and National Conference of Social Work. Attendance at exhibits conducted by State birth control leagues at State fairs in Minnesota, Michigan, and Illinois demonstrated the interest of the general public in planned parenthood.

Meetings. Principal meetings included the Annual Meeting held in New York City in January, during which the Federation was formed. A feature of the program was a symposium on population problems, which emphasized that the spread of birth control knowledge is essential to a democratic population policy for the United States.

At the National Conference of Social Work, which met in Buffalo, New York, in June, the Federation conducted three sessions on: Birth Control as a Public Health Measure; A Population Policy for the United States; and The Birth Control Clinic as a Community Resource.

The Southern Conference on Tomorrow's Children, held in Atlanta, in November, brought

birth control to the fore dramatically as a means of alleviating some of the South's more distressing ills. It was sponsored by a committee of more than 100 leaders in medicine, social welfare, economics, and community life, who represented 11 Southern States, and by the Birth Control Federation of America. The conference resolved to meet again in November, 1940, and also that conferences of a similar nature be held in each Southern State in the near future.

Legislation. The Federal laws, as construed in recent court decisions, do not prohibit the mailing of contraceptive supplies and information to physicians, or to other persons upon a physician's direction, for medical use. In only one State, Massachusetts, has the statute been construed as prohibiting the dispensing or giving of contraceptives in medical practice. In a case to test the Connecticut law, a lower court in 1939 upheld the right of physicians to give contraceptive advice. Appeal was made to the State Supreme Court, which will hand down a decision early in 1940.

State legislation during 1939 continued to center on placing prescription and sale of contraceptives in the hands of doctors and druggists. Federal legislation in effect Jan. 1, 1940, will require that the formulae of contraceptive jellies, creams, etc., in common with other proprietary articles, be printed on the package in which they are sold.

In Puerto Rico, U.S. District Judge Robert A. Cooper handed down in January, 1939, a decision that contraceptive advice under medical direction is legal. The way was thus cleared for the operation of birth control clinics under the act passed by the Insular Legislature in 1937.

The International Situation. Some of the world's leading biologists called birth control essential to the genetic improvement of mankind in a "Eugenics Manifesto," signed at the Seventh International Conference of Genetics in Edinburgh, Scotland, August, 1939.

In Great Britain, the National Birth Control Association in May, 1939, officially changed its name to the Family Planning Association, which its board believes, "describes more accurately our functions and the increasing scope of our activities." Birth control has been a public health measure there since 1930, when the British Ministry of Health issued the first of a series of memoranda, urging local maternity and child welfare authorities to establish contraceptive clinics.

Stringent laws against birth control and pressure for higher birth rates continued in Germany, Italy, and France. Fathers of large families in Germany and Italy are accorded tax exemptions and family grants, while bachelors pay higher taxes than married men. The recently drafted Code of the French Family provides family grants and government bounties for every child born.

Japan's birth rate has dropped to the lowest level in 10 years, owing to the Sino-Japanese war. The Information Bureau of the War Office has issued a pamphlet denouncing birth control and late marriage and stressing the need for increasing population, as a means of conducting a long-range war successfully. In China, despite the war, two new birth control clinics were opened during the year.

Making birth control knowledge available to all classes is a part of Sweden's democratic population policy. Births are encouraged not through

cash subsidies, but through measures for family security, including free maternity care, nursery schools, and state-subsidized housing.

Russia's population has increased 15.9 per cent since 1926, according to an announcement of the State Planning Commission in June, 1939. The birth rate has risen considerably since Russia abandoned its policy of legalized abortion in 1936. The *Medical Worker* of Moscow, in an article of January, 1939, criticized inferior contraceptive materials manufactured in the Soviet Union and demanded wider education in birth control "as one of the basic measures in the struggle against illegal abortion."

BODANZKY, bō-dāhnz'ky, ARTUR. An American orchestral conductor, died in New York, Nov. 23, 1939. Born in Vienna, Dec. 16, 1877, he was educated at the high school and at the Konservatorium there, where he studied the violin, but after hearing Gustav Mahler conduct *Lohengrin*, he decided to become a conductor. His first position was at Budweis in Bohemia in 1900; two years later he became Mahler's assistant at the Imperial Opera House in Vienna. In 1904 he directed the first Paris performance of *Die Fledermaus*. Subsequently he conducted at Berlin and Prague, and in 1909 he became director of the Ducal Opera at Mannheim. In 1914 he was invited to conduct *Parsifal* at Covent Garden, and in the following year he was invited to join the Metropolitan Opera Co., as principal conductor of the German wing.

His New York debut was made on Nov. 17, 1915 as conductor of *Götterdämmerung*. He became one of the outstanding conductors in the history of the Metropolitan, and was its senior conductor and the foremost conductor of Wagner in the United States. In 1929, after 14 years with the Metropolitan, Mr. Bodanzky resigned, but he resumed his post on November 30 with a brilliant performance of *Der Rosenkavalier*. His association with the Metropolitan continued until his death.

During the World War, Mr. Bodanzky became a citizen of the United States, and due to the disfavor in which German music was held, he turned to the study of Italian and French music. In 1916 he became conductor of the American Society of Friends of Music and remained with that organization until its disbandment. From 1919 to 1921 he led the concerts of the National Symphony Orchestra with conspicuous success. After the amalgamation of the latter organization with the Philharmonic Society (1921), he directed several Philharmonic concerts as guest-conductor.

Bodanzky revised the scores of Weber's *Oberon* and *Freischütz* and Beethoven's *Fidelio*, setting all the spoken dialogues to music. He also made an

excellent German translation of the libretto of Mozart's *Don Giovanni* (1911).

BOILERS. See POWER PLANTS.

BOLIVIA. A republic of South America. Sucre is the seat of the Supreme Court and nominally the capital, but La Paz, the largest city, is the actual seat of the government.

Area and Population. Taking into account the Chaco boundary settlement of 1938 (see 1938 YEAR BOOK, p. 131 f.), Bolivia has an area estimated at 537,792 square miles. The population on Dec. 31, 1937, was estimated at 3,282,755, divided racially as follows: White, 13.08 per cent; mestizo (mixed), 27.51; Indian, 52.34; others, 7.07. Estimated 1936 populations of the chief cities were: La Paz, 200,000; Cochabamba, 52,323; Oruro, 44,826; Potosí, 35,900; Santa Cruz, 31,300; Sucre, 27,508. Spanish is the language of the educated classes. The Indians speak mainly Quechua and Aymara.

Education and Religion. The illiteracy rate, which was 83.5 per cent for that part of the population seven years and over in 1900, remains high. The school enrollment in 1936 was: Elementary, 73,854; secondary, 5522; special schools, 4615; universities, 1482. Roman Catholicism is recognized as the state religion. Public exercise of other forms of worship is guaranteed.

Production. Mining is the chief industry, with tin accounting for some 70 per cent of the value of all exports. Provisional figures for mineral exports in 1938 in metric tons, with the value in pound sterling in parentheses, were: Tin, 25,893 (£4,851,850); silver, 199 (£518,406); wolfram, 1517 (£388,166); antimony, 9448 (£240,261); lead, 13,225 (£202,402); zinc, 10,704 (£150,697); copper, 2883 (£116,539). The output of crude petroleum was about 14,000 metric tons. Agriculture and stock raising are the other chief occupations. Wheat, quinoa, corn, rice, barley, sugarcane, cotton, coca leaves, tobacco, and coffee are the principal crops. Manufacturing is confined largely to alcohol and beverages, foodstuffs, textiles, and clothing.

Foreign Trade. Imports in 1938 totaled 70,558,889 bolivianos (59,234,452 in 1937) and exports 94,829,659 (124,598,852). (Conversions to dollars may be made at the rate of \$0.365 to the boliviano for both 1937 and 1938.) The United States supplied 25.5 per cent of the imports (27.7 in 1937); Germany, 17.9 (13.3); Great Britain, 7.0 (7.9); Japan, 7.0 (4.8). Of the 1938 exports, Britain took 62.5 per cent (59.9 in 1937); Belgium, 21.7 (23.4); United States, 4.6 (7.3). Metals, coca, quinine, and hides are the chief exports, and textiles, wheat, flour, sugar, live animals, machinery, etc., the main imports.

Finance. According to the Central Bank, governmental receipts in 1938 totaled 335,008,024 bolivianos (ordinary, 259,842,743; extraordinary, 75,183,281) and expenditures 330,027,334 bolivianos (ordinary, 263,875,619; extraordinary, 66,151,715). Budget estimates for 1939 placed receipts and expenditures at 300,669,856 bolivianos each. The internal public debt on Dec. 31, 1937 was 377,731,997 bolivianos, while the external debt totaled \$91,568,639 U.S. currency and 838,589 pounds sterling, including accrued interest payments due. No interest or amortization was paid on the foreign debt in 1938. For exchange rate of boliviano, see *History*. The 1940 budget estimates balanced at 627,000,000 bolivianos.

Transportation. In 1938 Bolivia had 1402 miles of railway line in operation, 50 miles under construction, and 498 miles under survey. Combined operating statistics of the nine principal lines in 1938 were: Freight, 1,205,149 metric tons; passengers, 1,204,361; revenues, 70,596,379 bolivianos; expenses, 60,583,108 bolivianos. For new railways under construction in 1939, see *History*. Highways in 1939 aggregated 5788 miles, all dirt surfaced. A new 45-mile road connecting La Paz with Lake Titicaca was opened June 10, 1939. Navigable rivers, 5600 miles. Five steamers ply the waters of Lake Titicaca (12,500 feet high). Air lines link the principal cities and connect with the Pan American Airways and Junkers (German) air networks. Statistics of the domestic Lloyd Aero Boliviano system in 1938 were: Miles flown, 497,651; passengers, 20,907; mail, 79,759 lb.; baggage, 567,139 lb.; freight, 2,375,147 lb.

Government. A new Constitution was promulgated Oct. 30, 1938 (see 1938 YEAR BOOK, p. 96, for main provisions). President at the beginning of 1939, Lieut.-Col. Germán Busch, who became provisional President by a military coup d'état on July 17, 1937, and was sworn in as constitutional President May 29, 1938, following his election by a Constitutional Assembly. Of 103 Deputies and 18 Senators elected to the Constitutional Assembly, 114 were members of the United Socialist Front supporting the Busch regime. The opposition parties all boycotted the election.

HISTORY

The Busch Dictatorship. The constitutional regime established by President Busch in 1938 (see 1938 YEAR BOOK, p. 96) proved of short duration. The Constitutional Assembly had adjourned on Oct. 30, 1938, and was to reassemble as the regular Congress on Aug. 6, 1939. President Busch had given his pledge to forswear "totalitarian ambitions" and follow democratic principles during the intervening period. On February 24 he suspended the state of siege proclaimed after the abortive revolt plot of November, 1938, and amnestied most of the participants. He also sought to calm the rising political unrest by authorizing the election on May 4 of an additional Senator from each of the nine Departments.

The election call spurred the opposition parties (Liberals, Republicans, and Socialist Republicans) to form a united front, renew their agitation against military control of the government and demand non-interference with the voting. Political agitation was stimulated by the increasingly acute economic and financial crisis that was Bolivia's heritage from the disastrous Chaco War of 1932-35. Fearing that his power was endangered, President Busch moved to eliminate threats from both within and without his regime. Two leading personalities within his government—Minister of Government Gabriel Gosalvez and Gen. Carlos Quintanilla, commander-in-chief of the army—were sent to Europe, Gosalvez as Ambassador to the Holy See and Quintanilla on a trip to Germany and Italy. Busch then visited army garrisons throughout the country to secure the support of the officers for his next move.

This came on April 24 in the form of a manifesto in which the President assumed all political and administrative powers, dissolved the Constitutional Assembly, suspended the Constitution, and announced the introduction of "iron discipline and stern readjustment of political and civic morality." His objective, he declared, was to end the rule of

financial privilege and extremist tendencies which had produced "the worst chaos in the history of Bolivia." Once these conditions were ended, he promised to hold elections for a new Congress. While the new regime resembled in many respects the traditional Latin American military dictatorship, it attempted to extend its control over the nation's economic as well as political life.

On April 27 Busch decreed heavy penalties for speculation in foreign exchange, arbitrary increase of prices of prime necessities, and of rent, and crimes against the public treasury and the safety of the State. Among crimes of the latter category were listed strikes, propaganda against the government and nation, and advocacy of political doctrines. The same decree gave the state absolute control of education and labor relations. The governmental services and cabinet were reorganized. Dionisio Foianini entered the cabinet as Minister of Mines and Petroleum.

Exploitation of Minerals. Foianini, instigator of the expropriation by the Bolivian Government in 1937 of Standard Oil properties representing an investment of \$17,000,000, was said to have persuaded Busch that the only way out of Bolivia's financial and economic dilemma was through state exploitation of the republic's oil and other mineral wealth. The way was cleared in part for the carrying out of this programme by the Bolivian Supreme Court's decision of Mar. 9, 1939, rejecting the Standard Oil Company's appeal against the 1937 expropriation decree. The agreements made with Argentina and Brazil in 1938 for the development of Bolivian oil resources (see 1938 YEAR BOOK, p. 97-98) were supplemented by an agreement with Paraguay signed Apr. 21, 1939.

This provided for the construction of a 350-mile oil pipe-line from the Camiri oil district in the eastern foothills of the Andes to the Paraguay River opposite Concepción and for the construction of an oil refinery at Villa Hayes opposite Asunción. Paraguay granted Bolivia a right of way 325 feet wide across the Chaco for the pipe-line and two free zones of 5000 acres each for the terminus of the pipe-line and the refinery, respectively. The refinery was to be completed in 18 months and the Chaco pipe-line within five years. In order to supply Bolivian oil to the Villa Hayes refinery before the Chaco pipe-line was completed, another 35-mile pipe-line was to be built to connect the Bolivian oil fields with the Argentine railway terminus at Tobatirenda near Yacuiba. From there oil could be taken by railway tank cars to Formosa on the Paraguay River and then by barge to Villa Hayes.

The agreement gave Bolivia a monopoly for the refining and supplying of all Paraguay's needs of petroleum products for 30 years and the right to export surplus petroleum without payment of Paraguayan customs duties or taxes of any kind. At the end of 30 years the refinery was to be taken over by the Paraguayan Government at cost less depreciation, but the Bolivian Petroleum Board was to retain ownership of the Chaco pipe-line. Half of the administrative staff and three-quarters of the workers in the Bolivian petroleum enterprises in Paraguay were to be Paraguayan citizens. The cost of the two pipe-lines and refinery was estimated at \$15,000,000.

German Barter Deal. Bolivia sought to obtain the completed installation of the refinery and pipe-lines as part of a barter deal with Germany in which Bolivian oil and other minerals would pay for German machinery, equipment and tech-

nical assistance. Minister Foianini announced early in May that the Reich had granted a credit of 4,000,000 marks for the purchase of equipment for the National Petroleum Board. On August 4 a Bolivian-German accord for the exchange of Bolivian minerals for German manufactures was signed in La Paz. After the announcement in August of the discovery of important new wells in the Eastern Bolivian fields, the La Paz Government on September 18 authorized issuance of a loan of 10,000,000 bolivianos by the Central Bank to carry on the work of the Petroleum Board. Meanwhile the outbreak of the European War ended for the time being hope of assistance from Germany.

Progress on Railways. Steady progress was made, however, in constructing the railway network to permit joint Bolivian-Argentine and Bolivian-Brazilian exploitation of the Bolivian oil deposits (see 1938 YEAR BOOK, p. 97). Extension of the Northwestern Railway of Brazil from Porto Esperança to Corumbá on the Bolivian frontier was undertaken. On June 16 bids for construction of the first section (El Carmen-Roboré) of the line linking Corumbá with Santa Cruz de la Sierra, chief city of eastern Bolivia, were opened in La Paz. A decree of June 10 provided for financing the Bolivian share of this project by taxes on beer, alcohol, brandy, and wine. The Brazilian Government appropriated about \$1,500,000 for its share of the cost by the decree-law of Sept. 26, 1939.

Meanwhile the Bolivian Government proceeded with construction of the Sucre-Camiri railway connecting the high Bolivian plateau and its railway network with the eastern lowlands and the refinery constructed in the oil zone by the Standard Oil Company. Engineering studies were made for the railway to be built with Argentine assistance connecting the Argentine railway terminus at Tobatirenda with Camiri and Santa Cruz. Surveys were also in progress for the two other lines called for by the Bolivian-Brazilian treaty of Feb. 25, 1938—the Cochabamba-Santa Cruz railway and the line from Santa Cruz to Puerto Grether on the Ichilo River.

Exchange Expropriation. The most controversial measure introduced by the dictatorship was the decree of June 7, which practically paralyzed the mining industry. It provided that all foreign exchange acquired by exporters of minerals be deposited in the Central Bank and that foreign reserves of the mining companies must be returned to Bolivia within 120 days. It gave the state a monopoly of the purchase and resale of minerals from third parties, nationalized the privately owned Mining Bank, and levied a 30 per cent tax on gross sales of mineral ores by the mining companies. Another decree established closer government control of the mining industry by setting up a national association of medium-sized miners.

These decrees were accompanied by popular demonstrations and speeches by Busch proclaiming the economic emancipation of the nation. They were considered in mining circles as the first step toward nationalization of the mining industry. Bonds of some of the leading Bolivian mining companies slumped as much as 40 per cent. The mine owners, representing for the most part foreign interests, greatly curtailed their operations and made repeated pleas for modification of the decrees. These were summarily rejected by the government. On July 4 Mauricio Hochschild, Jewish head of an important mining and tin-

buying firm, was arrested with a number of his associates for organizing a protest against the decrees.

A series of other decrees sought to relieve the exchange shortage, curb price increases, and strengthen government control of the economic system. On August 3 the Central Bank was completely nationalized, the government taking over all the shares and 20 per cent of the legal and dividend reserves accumulated up to June 30. The Bank was made the sole export agent for Bolivian products to Germany under the commercial accord with the Reich. On August 31 another decree provided for the purchase by the government of all gold mined in the country.

Death of President Busch. These measures, combined with Busch's German connections and various governmental tendencies, increased criticism of the regime as an imitator of European totalitarianism. Bolivia's adhesion to the anti-Comintern pact was predicted. There was growing suspicion abroad and dissension at home. In the middle of May the President exiled a number of opposition leaders to Coati Island in Lake Titicaca and other isolated parts of the republic. Others were forced to leave the country. Nevertheless there were sporadic reports of anti-government conspiracies.

Difficulties also developed within the government. A scheme for the sale of immigration permits to numerous Jewish refugees, uncovered late in May, led to the arrest of several high Bolivian consular officials and the resignation of Foreign Minister Eduardo Diez de Medina. Finance Minister Santiago Schulze resigned when the President rescinded measures he had authorized favorable to the wealthy Patiño mining interests. The new Foreign Minister, Alberto Ostria Gutiérrez, withdrew from the cabinet on August 3 in protest against the nationalization of the Central Bank, and Señor Foianini was appointed to succeed him. With the development of the European crisis, the economic situation seemed to be going from bad to worse.

On August 23, while attending a birthday party at his home, President Busch (q.v.) was killed by a bullet through the temple. The Minister of Propaganda announced that he had committed suicide as a result of overwork. There were widespread rumors that the President had been assassinated and an official inquiry was ordered, which confirmed that death was self-inflicted.

The Provisional Regime. Immediately after Busch's death, General Quintanilla, who had returned from his European trip, assumed the Presidency "by vote of the generals and officers of the La Paz garrison." He announced that the army would exercise governmental powers until elections could be held to restore constitutional government and "normalize the national situation." A new cabinet was sworn in on August 26. Quintanilla stated that he would continue Busch's social program, but took steps to end the dictatorship. On September 22 the censorship was abolished and on October 6 the 1938 Constitution was restored. General elections for a President, Vice President and a complete Congress were convoked for Mar. 7, 1940.

The first candidate for the Presidency to announce himself was Lieut. Gen. Bernardino Bilbao Rioja, commander-in-chief of the army. On October 27 he was expelled from Bolivia by order of Provisional President Quintanilla and the cabinet on the ground that he was conspiring to seize

power through a military coup d'état. Bilbao's expulsion was the signal for an abortive uprising in the Military College at La Paz, led by his brother, Col. Sinforiano Bilbao. On December 12 Gen. Enrique Peñaranda, a Chaco War veteran, resigned as Minister of Defense and accepted the presidential nomination offered him by the Socialist, Republican Socialist, and Liberal parties.

Meanwhile the outbreak of the European war had caused a temporary cessation of tin shipments and aggravated every aspect of the economic crisis. Early in September the government suspended all transactions in foreign exchange to conserve its meagre supply. Merchants raising prices were threatened with severe punishment. On October 1 the government substantially modified the exchange-control legislation of June 7 and July 7 in line with the complaints of the mine owners. This action and the establishment of the Anglo-French convoy system permitted the regular resumption of tin and other mineral exports before the end of October, relieved the foreign exchange shortage, and checked the rapid depreciation of the Bolivian currency. The government's receipts of foreign exchange increased from £72,000 (sterling) in August to £390,000 in October.

A decree of October 21 provided for a 30 to 40 per cent increase in wages and salaries of workers in industry, commerce, mining, and domestic service.

For obituaries of ex-Presidents Eliodoro Villazón and Dr. Juan Bautista Saavedra, who died during 1939, see *NECROLOGY*. Gen. Hans Kundt (q.v.), German commander of the Bolivian army during the first part of the Chaco War, died in Italy.

Foreign Relations. Bolivia's foreign relations during 1939 were marked by growing collaboration with all of her neighbor republics, particularly in economic matters. The Chaco Peace Conference at Buenos Aires (see 1938 *YEAR BOOK*, p. 131 f.) was formally disbanded on January 24. The mixed Bolivian-Paraguay commission organized to mark the boundary fixed by the arbitral award of Oct. 10, 1938, commenced its labors early in May.

The cordial relations established between the two former belligerents were manifested by the Bolivian-Paraguayan treaty of April 21 (see above), the exchange of commercial missions by the two countries, and the presence of a special delegation from Bolivia at the inauguration of President Estigarribia of Paraguay (q.v.). En route to Asunción from the Panama Conference, the Paraguayan Foreign Minister stopped over in La Paz, October 18-22, and concluded four protocols designed to promote economic and cultural relations. They included an agreement on details of the proposed petroleum refinery on the Paraguay River and for establishment of direct Asunción-La Paz air services.

The Bolivian Legations in the Chilean and Mexican capitals were raised to Embassies by reciprocal agreement with those governments. The reiteration of Bolivia's desire for a Pacific outlet made by Foreign Minister Díez de Medina at the Pan American Conference in Lima caused further discussion in Chile and Bolivia in 1939. Bolivian students protested when the new Chilean Ambassador, Benjamin Cohen, in a speech at La Paz characterized the Bolivian port aspirations as "sentimental." Some Chileans, however, endorsed the proposal for cession of Arica to Bolivia, while

the Chilean Senate studied a plan to make Arica a free port.

BOOK PUBLISHING. Book production in the United States showed a decline in 1939—the first since 1933—to judge by number of titles published. Titles issued during the year may be classified as follows: Total: 10,640 in 1939; 11,067 in 1938; 427 or 3.85 per cent decrease. New Books: 9015 in 1939; 9464 in 1938; decrease 449. New Editions: 1625 in 1939; 1603 in 1938; increase 22. Religion: 697 in 1939; 821 in 1938; decrease 124. Fiction: 1547 in 1939; 1663 in 1938; decrease 116. Poetry, Drama: 653 in 1939; 744 in 1938; decrease 91. Juveniles: 949 in 1939; 1041 in 1938; decrease 92. History: 804 in 1939; 857 in 1938; decrease 53.

Classifications showing an increase included Medicine, General Literature, Sociology and Economics, Law; among those showing a decrease were Biography, and Geography and Travel. It might be noted that the decline in fiction titles has been going on for several years. There were 233 crime novels published, 151 by American authors, 82 by English authors, 64 by women.

In 1939, there were 247 firms which published more than five books, as compared with 243 in 1938; and 39 firms published more than half of all books. The Macmillan Company (New York) led with 492 titles. Important new publishing enterprises were in the cheap book field: Pocket-Books with 33 reprints, and Penguin Books in the United States with 109 new and reprint titles.

Characteristic of reading habits in the United States in the year was the popularity of new books dealing with the underdog, or the seamy side of life, or on the muckraking order, like the best-selling Steinbeck's *The Grapes of Wrath*. Notable also was the comparative scarcity of books by European writers, because of war conditions, which added to the literary emphasis on the American scene. The most important non-fiction book was Sandburg's four volume *Lincoln, the War Years*, which with the earlier *Lincoln; The Prairie Years*, in two volumes, would seem to be the definitive life of Lincoln for this generation. (See also *LITERATURE, ENGLISH AND AMERICAN*.)

A new 69-cent edition of Margaret Mitchell's *Gone With the Wind* was published at the time of the release of the motion picture based on the book, bringing total printings of this phenomenal best seller to over 2,500,000.

Best sellers of 1939 in order, as reported by *The Publisher's Weekly*, were:

Fiction. *The Grapes of Wrath*, by John Steinbeck (300,000 copies); *All This and Heaven, Too*, by Rachel Field; *Rebecca*, by Daphne du Maurier; *Wickford Point*, by John P. Marquand; *Escape*, by Ethel Vance; *Disputed Passage*, by Lloyd C. Douglas; *The Yearling*, by Marjorie Kinnan Rawlings; *The Tree of Liberty*, by Elizabeth Page; *The Nazarene*, by Sholem Asch; *Kitty Foye*, by Christopher Morley.

Non-Fiction. *Days of Our Years*, by Pierre Van Paassen (230,000 copies); *Reaching for the Stars*, by Nora Waln; *Inside Asia*, by John Gunther; *Autobiography with Letters*, by William

Lyon Phelps; *Country Lawyer*, by Bellamy Part-ridge; *Wind, Sand and Stars*, by Antoine de Saint Exupéry; *Mein Kampf*, by Adolf Hitler; *A Peculiar Treasure*, by Edna Ferber; *Not Peace But a Sword*, by Vincent Sheean; *Listen! the Wind*, by Anne Morrow Lindbergh.

BOSTON. See WATERWORKS AND WATER PURIFICATION.

BOSTON UNIVERSITY. A non-sectarian institution of higher education in Boston, Mass., founded in 1839 and chartered as Boston University in 1869. The enrollment for the autumn session of 1939 was 11,820, distributed as follows: College of Liberal Arts, 1076; College of Business Administration, 3303; College of Practical Arts and Letters, 587; College of Music, 212; Sargent College of Physical Education, 265; School of Theology, 262; School of Law, 357; School of Medicine, 209; School of Education, 2525; School of Religious and Social Work, 155; Graduate School, 558. The enrollment for the 1939 Summer Sessions was 2020. The University faculty numbers 627. Total income for the year 1938-39, \$2,078,748. The endowment amounted to \$5,142,598. Total volumes in the University libraries, 187,500. The Charles Hayden Memorial, a new million dollar building for the College of Business Administration, was dedicated and put into use at the opening of the fall semester, 1939. President, Daniel L. Marsh, Ph.D.

BOTANY. The interrelations of the main divisions of the study of plant life are well illustrated by many contributions to botanical science during the past year. This is especially evident in taxonomic surveys, involving cytology, genetics, ecology, as well as anatomical and morphological features. Thus, Babcock and Stebbins (*Carnegie Inst. Wash. Pub.* 504) have treated the North American indigenous species of *Crepis* from the standpoint of their morphology, cytogenetics, ecology, and geographical distribution. All of the species occur in the western half of North America except one, *Crepis nana*, which is also found in Labrador and Newfoundland. Two of the species, with 14 as the diploid number of chromosomes, are arctic-alpine forms. One species, *C. runcinata*, is distinctive in its chromosome number of 22, and also in its habitat, being a plant of wet meadows, while the others are typical of arid, well-drained mountain slopes. This species does not hybridize with the others, and has several distinct subspecies or varieties. The remaining nine species show varying chromosome numbers and evidence of hybridization. Several of them contain apomictic races, in which the seed formation occurs with, however, the omission of fertilization.

Mensinkai (*Jour. Genetics* 39:1) contributed cytogenetic studies in the genus *Allium*. He examined 17 species and found that 11 were diploids, 4 tetraploids, and 2 hexaploids. The chromosome number of 15 species was determined for the first time. Within the genus, evolution is taking place in change in number, change in chromosome structure, and change in the genotype. Meurman and Therman (*Cytologia* 10:1) have studied the

morphology of the chromosomes in species and hybrids of the genus *Clematis*. Of the 25 species studied, 23 were diploids, with 16 as the number of chromosomes. One species was a tetraploid and one a hexaploid. Among the horticultural forms and varieties of this genus, various types of chromosome combinations were found.

Taxonomy. Along more purely taxonomic lines, several papers have appeared. Seim (*Rhodo* 41:317) has described 31 North American species of *Crotalaria*. This genus is widespread, with its main center in tropical Africa, where approximately 300 species, out of a total of 400 recorded, are found. Krukoff (*Brittonia* 3:205) has described 25 American species of the genus *Erythrina*. These plants are of some interest because of the possibility of the occurrence of Curare alkaloids in their tissues. By far the larger number of species are Central and South American. Cutler (*Ann. Mo. Bot. Gard.* 26:373) has studied the North American species of the genus *Ephedra*, 15 being recognized. This genus is one of three of the unusual family Gnetaceae. Various species are found in the desert regions of North and South America, southern Africa, and parts of Asia. The drug, ephedrine, for centuries has been secured from Asiatic species. Jones (*Jour. Arnold Arbor.* 20:1) has given a synopsis of the North American species of *Sorbus*, 11 being recognized.

Cytology and Genetics. Goodspeed and Avery (*Jour. Genetics* 38:381) have studied the trisomic types of *Nicotiana sylvestris*. The first trisomic was described in *Datura* about 20 years ago. It is a plant in which three chromosomes of 1 type, instead of 2, are found; otherwise the plant is a diploid. The authors grew approximately 9000 plants during the past 10 years, and found 164 primary trisomics of 11 different types. Each of the primary trisomics differs in a large number of characters—cytological, anatomical, and physiological. Certain characters are minute and inconspicuous, while others are large and striking. Upcott (*Jour. Genetics* 39:79) has investigated the nature of tetraploidy in *Primula kewensis*. The plant is interesting, since it is the first hybrid whose ability to breed true was shown to be the result of the doubling of its chromosome complement. Muntzing (*Hereditas* 25:387) described the methods of production of rye-wheat amphidiploids and some of their properties. Different strains vary greatly in vigor, fertility, and the regularity of their nuclear division. Gustafsson (*Hereditas* 25:33) has studied some of the European blackberries from the standpoint of the differences in their polyploidy. Various combinations, such as triploid, tetraploid, or pentaploid, were found. Some American forms were studied, and diploid, triploid, pentaploid, hexaploid, and octaploid forms were noted. Harvey (*Genetics* 24:437) studied the inheritance of a physiologic character, investigating the heredity differences in the plant nutrition of corn hybrids and also strains of two species of tomatoes. Whaley (*Jour. Hered.* 30:335) investigated the inheritance of leaf and flower characters in *Tropaeolum* hybrids. He found that the expression of acutely lobed, roundly lobed, and orbicular leaf shapes is controlled by two genes. Leaf color is also controlled by two complementary genes, the presence of both resulting in dark green leaves, the absence of either, in a medium green, and the absence of both, a light green. The intensity of the yellow color, due to yellow plastids, is dependent upon the cumulative action of two

or more genes. Red anthocyanin may accompany the yellow pigments, its presence and intensity depending upon several genes. The number of petals is inherited on a simple basis with the normal five-petaled type being dominant to the simple double type. Wetmore and Delisle (*Amer. Jour. Bot.* 26: 1) studied the genetics and cytology of *Aster novae-angliae* and *A. multiflorus* and their reciprocal hybrids. Under natural conditions, they found a wide range of forms which were evidently hybrids between these two species. Purvis (*Ann. Bot. N.S.* 3: 719) studied hybrids between spring and winter Petkus rye. Spring rye differs from the winter in a shorter time required for flowering, and tillers less. Winter rye may be made to take on the appearance and habits of spring rye through vernalisation. When winter rye is crossed with spring rye, the first generation shows the spring habit dominant, while in the second generation, "spring" and "winter" plants occur in approximately the ratio of 3:1. The early and late flowering dates are not inherited in such a simple fashion, but the evidence indicates clearly that date of flowering is inherited independently of the spring and winter habit.

Use of Colchicine in Cytology and Genetics. Colchicine is finding a wide application in producing changes in the chromosome make-up of plants. Levan (*Hereditas* 25: 9, 109) has studied the effect of colchicine on meiosis in *Allium*, recording a number of conspicuous effects on the spindle mechanism and chromosomes. He has also used the material on diploid *Petunia* to produce tetraploid and octoploid forms. Two methods of treatment were employed, one, soaking the seed in a water solution of colchicine, and the other, treating seedlings in colchicine dissolved in agar. Tetraploids were produced in greater abundance than octoploids. O'Mara (*Jour. Hered.* 30: 35) made some observations on the immediate effects of colchicine, finding that the treated chromosomes are more accurately measurable than the untreated. Sears (*Jour. Hered.* 30: 38) has made a study of various amphidiploids in species of *Aegilops* which are induced by colchicine. Smith (*Jour. Hered.* 30: 291) reported on the induction of polyploidy in *Nicotiana* hybrids; sterile crosses were affected in such a way as to become fertile through the influence of colchicine on the chromosome number. Warmke and Blakeslee (*Jour. Hered.* 30: 419), by colchicine treatment, brought about both simple and multiple polyploidy in *Nicotiana*.

Growth Substances. Many investigators have made contributions on the influence of various growth substances on plant life. Great interest has been aroused in the study of the influence of vitamin B₁. Its value in stimulating root growth has found a practical application in hastening root development in cuttings or divisions of plants. Went and White (*Bot. Gaz.* 100: 465) carried out experiments on the transport of auxin in the plant tissues. Lindner (*Bot. Gaz.* 100: 500) studied the effects of certain growth substances on the development of buds and roots in horse-radish. Mitchell and Stuart (*Bot. Gaz.* 100: 627) studied the growth and metabolism of soybean cuttings, roots having been formed through the stimulation of growth substances. Nixon and Gardner (*Bot. Gaz.* 100: 868) reported on the effect of certain growth substances on inflorescences of dates. Gardner and Marth (*Bot. Gaz.* 101: 226) investigated the effectiveness of certain growth sub-

stances on the parthenocarp in holly. Gustafson (*Amer. Jour. Bot.* 26: 135) studied the distribution of auxin in fruits and its significance in fruit development. Van Overbeek (*Bot. Gaz.* 101: 450) obtained evidence for auxin production in isolated roots growing in vitro. Robbins and Schmidt (*Amer. Jour. Bot.* 26: 149) carried out further experiments on the growth of excised roots in pure culture. Addicott (*Bot. Gaz.* 100: 836) investigated the relation of vitamin B₁ to the meristematic activity of isolated pea roots, and Cooper (*Bot. Gaz.* 100: 844) determined the influence of vitamins on the germination of pollen grains and fungous spores. Brannon and Bartsch (*Amer. Jour. Bot.* 26: 271) studied growth and cell division in green algae as influenced by growth substances. Goodwin (*Amer. Jour. Bot.* 26: 74) made a comparison of techniques in the determination of three-indole acetic acid. Thimann and Schneider (*Amer. Jour. Bot.* 26: 328) made a comparison between the relative activities of different auxins. Bausor (*Amer. Jour. Bot.* 26: 415) described a new growth substance β -naphthoxyacetic acid. Addicott and Devirian (*Amer. Jour. Bot.* 26: 667) found that nicotinic acid is a second growth factor for excised pea roots. Kaiser and Albaum (*Amer. Jour. Bot.* 26: 749) studied the relation of growth substances to root and shoot growth of an early and late variety of oats.

Mineral Nutrients. Hurd-Karrer (*Plant Physiol.* 14: 9) investigated the antagonism of phosphorus, potassium, and calcium, essential to plants, toward the chemically related toxic elements, arsenic, rubidium, and strontium. Raleigh (*Plant Physiol.* 14: 823) demonstrated the necessity of silicon for the growth of the beet plant. Arnon and Stout (*Plant Physiol.* 14: 371) studied the necessity of minute quantities of copper for plants. Stout and Arnon (*Amer. Jour. Bot.* 26: 144) also described experimental methods for the study of the role of copper, manganese, and zinc in the nutrition of higher plants. Beath, Gilbert, and Eppson (*Amer. Jour. Bot.* 26: 257, 296) gathered together very interesting data on the use of indicator plants in locating seleniferous areas in western United States.

Photoperiodism. Grainger (*Ann. Appl. Biol.* 26: 684) studied the anatomical, floristic, and phenological aspects of the time of flowering of plants, and his studies have a direct bearing upon the general problem of photoperiodism. He found that the emergence of flowers in various plants may be greatly influenced by temperature and other conditions which occur much earlier in the history of the plant. Hamner and Long (*Bot. Gaz.* 101: 81) studied the localization of the photoperiodic perception in *Helianthus tuberosus*. Parker and Borthwick (*Bot. Gaz.* 101: 145) studied the effect of variation in temperature during photoperiodic induction, and also the effect of the photoperiod on the development and metabolism of the soybean (*Bot. Gaz.* 100: 651). Long (*Bot. Gaz.* 101: 168) determined the influence of various environmental factors on photoperiodic induction.

Ecology. Pool (*Bull. Torrey Bot. Club* 66: 457) has recorded some of the more important effects of drought on vegetation in parts of Nebraska. The period of dry years from 1933 to 1938 has seen very drastic effects on the trees, shrubs, and annual plants. Various factors entered into the resistance of the plants to drought. It may be noted that the Hackberry has with-

stood the drought conditions best of any of the trees, Honey Locust and Red Cedar also being successful. The grass in the lawns and parks has largely been replaced by a weedy annual flora. Robertson (*Ecol. Monog.* 9:431) has made a study of the true-prairie vegetation after three years of extreme drought, recording remarkable changes. Ramaley (*Ecol. Monog.* 9:1) has given a detailed report on the sand-hill vegetation of northeastern Colorado, describing the various types of soil and plant communities, and their relation to various ecologic factors. Tansley, *The British Islands and Their Vegetation* (930 p., University Press; Macmillan Co.) has given a comprehensive account of the British vegetation from an ecological standpoint. He discusses the history, distribution, nature, and classification of the vegetation of the British Islands from the standpoint of environment. The flora of characteristic areas, such as woodland and grassland, is fully described.

Poisonous Plants. Muenscher, *Poisonous Plants of The United States* (Macmillan Co.), has published extensive information on the subject. About 400 species of plants are included, of which about 100 are listed as causing dermatitis. A few species are reported to cause hydrocyanic acid poisoning, and some contain excess quantities of selenium in certain areas of the Rocky Mountain region of the United States.

BOWDOIN COLLEGE. An institution of higher education for men in Brunswick, Me., founded in 1794. The enrollment for the autumn session of 1939 was 649. There were 58 faculty members and four Teaching Fellows. The productive funds of the college amounted to \$8,341,186, and the income for 1937-38 was \$591,484. The library contained more than 178,000 volumes. President, Kenneth Charles Morton Sills, LL.D.

BOWLING. See SPORTS.

BOXING. See SPORTS.

BOYS' CLUBS OF AMERICA, INC. A national organization formed in 1906, with headquarters at 381 Fourth Ave., New York City. Membership in a Boys' Club is open to boys of all races and creeds from the age of 8 to 18. Through interesting boys in supervised leisure-time activity, Boys' Clubs have an opportunity to do character formation work of distinct value. They specialize in service to the underprivileged boy. Latest statistics give a federation of 351 Boys' Clubs in 194 cities in 37 States, with an enrollment of 300,000 boys. The Boys' Club Federation of Canada, with 21 Boys' Clubs, is affiliated with Boys' Clubs of America.

The officers in 1939 were: President, William Edwin Hall; chairman of the Board, Herbert Clark Hoover; secretary, William Ziegler, Jr.; treasurer, Albert H. Wiggin, and executive director, Sanford Bates.

BOY SCOUTS OF AMERICA. An organization incorporated in 1910, and chartered by Congress in 1916, to develop the character of boys and train them for the duties of adult life by influence brought to bear in their work and play. Each boy,

on joining the organization, takes the Scout Promise to keep himself "physically strong, mentally awake, and morally straight." The movement is nonsectarian and without military or political connection.

The membership as of Sept. 30, 1939, numbered 1,340,950; 857,453 were Scouts, 146,451 Cubs, and 303,872 Adult Leaders. There were 12 regional districts subdivided into 535 Local Councils.

The official magazine for boys is *Boys' Life*, and for Scout Leaders *Scouting*. The National Officers in 1938 were: President, Walter W. Head; Treasurer, Lewis Gawtry; National Scout Commissioner, Daniel Carter Beard; Chief Scout Executive, James E. West; Deputy Chief Scout Executive, George J. Fisher. Headquarters of the National Council are at 2 Park Avenue, New York City.

BRAZIL. A republic of South America, comprising 20 States, the Federal District, and one Territory. Capital, Rio de Janeiro.

Area and Population. Area, 3,286,170 square miles; population, estimated at 44,115,825 on Dec. 31, 1938 (30,635,605 at 1920 census). During the period 1820-1937 a total of 4,603,414 immigrants settled in Brazil, of whom 32.6 per cent were Italians, 30.3 Portuguese, 12.9 Spanish, 4.9 German, and 3.9 per cent Japanese. There are strong infusions of Negro and Indian blood in the northern States. Estimated populations of the chief cities in 1937 were: Rio de Janeiro, 1,801,784; São Paulo, 1,217,330; Recife (Pernambuco), 510,102; São Salvador (Bahia), 363,726 (1935); Porto Alegre, 352,068; Belem (Para), 303,740. Portuguese is the official and principal language, but Italian and German are widely used.

Defense. Military training is compulsory for all males from 21 to 45 years of age, the first year in the ranks and the rest in the reserve. The army's peace strength in 1938 was 6548 officers and 72,525 men; air force, 3500. The navy consists of 2 battleships and 3 cruisers, all laid down in 1907 but extensively refitted; 8 or more destroyers, 4 submarines, and 2 river monitors.

Education and Religion. About 70 per cent of the adult inhabitants are illiterate. The total school enrollment in 1935 was 2,574,802. Under the decree of Nov. 18, 1938, a National Commission of Primary Education was established to organize a nation-wide campaign against illiteracy, and in general to reorganize the primary education system. Roman Catholicism is the predominant religion.

Production. Agriculture, stock-raising, and manufacturing are the chief occupations. Brazil ranks first in the world in production of coffee, second in cacao, and third in sugar and tobacco. Coffee accounted for 45 per cent of the value of all exports in 1938. Production of the chief crops (in metric tons) was: Coffee, 140,000 in 1938-39; cacao, 128,000 in 1937-38; sugar, 120,000 in 1938-39; tobacco, 93,400 in 1936-37; wheat, 150,000 in 1936-37; corn, 6,625,500 in 1936-37; rice, 1,250,200 in 1936-37; cotton-seed, 948,000 in 1938-39; cotton, 407,000 in 1938-39. The 1937 wool clip was 18,000 metric tons. Production of inspected meat in 1936 was (in metric tons): Beef and veal, 775,500; mutton and goat, 9100; pork, 180,000.

Output of the leading mineral and metallurgical products in 1937 was (in metric tons): Coal, 763,000; salt, 707,000; manganese ore (metal content), 65,000 (exports in 1938); iron ore (metal content), 220,000; pig iron and ferroalloys, 98,000; steel ingots and castings, 76,000; gold, excluding alluvial, 4534 kilograms. Diamonds, monazite,

chrome and other minerals are produced. The forests yield hardwoods, rubber, carnauba wax, oil seeds. Cotton weaving is the chief manufacturing industry.

Foreign Trade. Imports in 1938 totaled 5,195,570,000 milreis (5,314,551,000 in 1937); exports, 5,096,890,000 (5,092,060,000). Values of leading 1938 exports were: Coffee, 2,296,110,000 milreis; raw cotton, 929,856,000 milreis; cacao, 212,996,000 milreis; hides and skins, 208,959,000 milreis; oranges, 112,472,000 milreis; carnauba wax, 101,016,000 milreis. Machinery and apparatus, wheat, iron and steel manufactures, vehicles and parts, coal and coke, automobiles and gasoline were leading imports, in order of importance. The United States in 1938 purchased 34.3 per cent of Brazil's exports (36.3 in 1937); Germany, 19.1 (17.1); Great Britain, 8.8 (9.5). Of the imports, Germany supplied 25 per cent (23.9 in 1937); United States, 24.2 (23.1); Argentina, 11.8 (13.9); Great Britain, 10.4 (12.1). See **IMPORTS AND EXPORTS**.

Finance. Current budgetary revenues in 1938 were 3,880,000,000 milreis and current expenditures 4,735,000,000 milreis. With the aid of credits of 1,542,000,000 milreis and other income, Federal accounts were balanced at 5,840,000,000 milreis. The 1939 budget estimates placed revenues at 4,071,000,000 and expenditures at 4,065,000,000 milreis, as compared with 1940 estimates of 4,209,000,000 and 4,422,000,000 milreis, respectively. The foreign debt on Dec. 31, 1938, was distributed as follows: £104,188,400; 273,634,212 French paper francs; 229,185,500 gold francs; \$168,771,745. The internal debt was: Funded, 4,247,786,000 milreis; floating, 2,830,364,000 milreis. The milreis exchanged at \$0.0623 in 1937 and \$0.0568 in 1938 at the free rate.

Transportation. At the beginning of 1939 Brazil had 21,313 miles of railways (317 miles electrified); 119,683 miles of highways (see **ROADS AND STREETS**); and air lines connecting the leading Brazilian cities with one another and with the chief centers of the Americas and Europe. Improvements and extensions of a number of Brazilian railways were under way in 1939 and work was commenced on the important line connecting the Brazilian railway network with Santa Cruz, metropolis of eastern Bolivia (see **BOLIVIA** under *History*). Highway projects under construction in 1939 included a new Santos-São Paulo road, the last stretch of the Rio de Janeiro-Porto Alegre road, and a highway network in Rio Grande do Sul opening up a rich agricultural region. Statistics of the military air-mail service for 1938 were: Lines, 14; length, 9269 miles; miles flown, 1,033,642; mail carried, 106,066 lb.

Government. Under the Constitution of Nov. 10, 1937, Brazil is an "authoritarian" state (see 1937 YEAR BOOK, p. 102) ruled by President Getúlio Vargas. Vargas became provisional President on Nov. 3, 1930, after leading a successful military revolt. Under the Constitution promulgated July 16, 1934, he was elected constitutional President the following day for a four-year term. The 1937 Constitution extended his term for six years from 1938. For developments in 1939, see *History*.

HISTORY

Brazilian internal affairs and external relations during 1939 pursued the trend recorded during the preceding year (see 1938 YEAR BOOK, p. 101 f.). President Vargas continued to rule

through a personal dictatorship without establishing the governmental institutions called for under the 1937 Constitution or holding the promised plebiscite to secure popular ratification of his regime. He nevertheless retained wide popular support by pushing ahead with a nationalistically inspired program of social welfare, economic development with the aid of foreign and Brazilian capital, and close co-operation with the United States—the policy vigorously espoused by Foreign Minister Oswaldo Aranha. He also strengthened the national defenses, took steps to end the Nazi agitation among the German minority, and sought by collaboration with the other American republics to cushion the shock of the European war to the national economy.

Political Developments. Brazil remained relatively free of the political agitation and disturbances of previous years. Plínio Salgado, leader of the outlawed pro-Fascist *Integralistas* who staged the abortive revolt of May 11, 1938, was arrested in his hideout in São Paulo on Jan. 26, 1939. On May 16 Salgado issued a manifesto asking his "million-odd former followers" to support the Vargas regime. Minister of Justice Francisco Campos then announced that Salgado was free, but on May 29 he was again arrested and on June 22 was deported on a German steamer bound for Lisbon. On June 13 Rio de Janeiro police balked a plot to free the Leftist leader, Luis Carlos Prestes, who was serving a 16-year prison term for his part in the 1935 Leftist revolt. On December 9 the police announced the arrest of 100 persons and the crushing of an alleged Communist plot to create unrest in the army and among government employees and other workers. A Department of Press and Propaganda was established December 27 to organize national propaganda and extend the censorship.

Brazilianization. The measures inaugurated in 1938 to counteract Nazi domination of the German population in southern Brazil, as well as Italian and Japanese nationalist propaganda among their Brazilian minorities, were extended during 1939. Steps were also taken to break up the concentrations of foreign immigrants in colonies where they remained out of contact with Brazilian customs, culture and political institutions. The artillery regiment stationed in 1938 at Blumenau, the principal German center in the State of Santa Catharina, was reinforced in 1939 by an infantry battalion composed of Portuguese-speaking recruits from northern Brazil. Conscripts called to the colors in southern Brazil were sent to Rio de Janeiro and other distant points for their year of military training.

The government sought to direct a stream of Portuguese and North American immigration into the largely German-populated districts of southern Brazil by free grants of land and relaxation of immigration restrictions. On May 3 the Brazilian military commander in Santa Catharina prohibited the use of German and other foreign languages in public meetings, church services, radio broadcasts and in the instruction of children. The 1938 decree requiring the use of Portuguese in all former foreign-language schools had already led to the closing of many German schools. On June 24 President Vargas lowered the immigration bars to permit immigration of 3000 German Catholics of Jewish descent from German concentration camps into southern Brazil.

A decree of June 28 authorized the expulsion at the President's discretion of any foreigner be-

littling Brazil and her institutions "through thoughts, actions or practice." A Japanese newspaper publisher at São Paulo was the first to be deported under this decree. On July 19 another decree provided that existing foreign-language periodicals could import paper duty free and that new publications could be established only if they were printed in both Portuguese and the foreign language. A decree of August 25 tightened government control over Brazilian-born children of foreigners and prohibited the grouping of foreigners of a single nationality in Brazilian colonies. On August 29 the government decreed that all schools must be directed by Brazilians, that military conscripts might speak only Portuguese, and that Brazilian-born children under 18 could not be sent abroad for their education unless accompanied by their parents or guardians.

These measures met with growing opposition among the German-speaking minority. Some 3000 Germans returned to the Reich before the outbreak of the European war rather than accept Brazilianization. A number of other pro-Nazi leaders were expelled. At the end of October it was reported that a series of clashes had taken place at Blumenau between civilians and soldiers.

Economic and Social Measures. A five-year plan for the development of basic industries, public works and national defense was launched on January 19. The total cost of the plan was estimated at three billion milreis (about \$150,000,000) and a special credit of 600,000,000 milreis (about \$30,000,000) covering 1939 was distributed as follows (in milreis): National Petroleum Council, 15,000,000; Ministry of War, 50,000,000; Navy, 30,000,000; Transportation and Public Works, 105,000,000; Agriculture, 30,000,000; Education and Health, 30,000,000; Justice and Internal Affairs, 15,000,000; Finances, 325,000,000.

An apparent step toward nationalization of insurance was seen in the decree-law of April 3 establishing the Brazilian Reinsurance Institute as a legal entity in charge of all underwriting in Brazil. All insurance issued by domestic and foreign companies operating in Brazil, in excess of a certain limit, was made subject to reinsurance by the Institute. Beginning July 1, 1940, all commercial and industrial enterprises having real or personal property of 500 contos or more were required to take out fire and transportation insurance in Brazil. The Institute was to be administered by a chairman and six members, of whom the chairman and three members were Presidential appointees.

On May Day President Vargas created a labor tribunal with jurisdiction over issues between workers and employers. On November 10, second anniversary of the dictatorial coup, the President created a national commission for the protection of parents with numerous children. The same day he appointed Federal delegates from all of the States to work out the programme for a national conference on the co-ordination and improvement of economic and administrative affairs, scheduled for 1940.

The discovery of oil in the State of Bahia in January spurred the nationalization of the petroleum industry. A National Petroleum Council, monopolizing the distribution of petroleum products, was created and a contract was signed with a United States firm for the first of several gasoline refining plants. Sizable oil supplies were purchased by the Petroleum Council from the Mexican Government for sale in competition with

established United States and British companies, and drilling machinery was brought from the United States to extend the search for oil in Brazil.

Most important were the steps taken for the development of Brazilian transportation systems and basic industries with capital and loans raised in the United States. United States Steel studied proposals for establishment of a \$30,000,000 steel industry in collaboration with the Brazilian Government and private Brazilian capital. On September 27 the government closed a deal with United States companies for 22,500 tons of rails costing \$1,900,000 and for 14 ships costing \$3,500,000. Both deals called for 35 per cent cash payment in dollars by the Bank of Brazil and 65 per cent credit by the Export-Import Bank of Washington at 5 per cent interest. More deals were under negotiation on a similar basis. United States business interests expressed willingness to advance long-term credits amounting to \$50,000,000 for Brazilian transportation and industrial enterprises.

Accords with United States. These private credits to the Brazilian Government were made possible as a result of a series of economic and financial accords signed by Foreign Minister Aranha and Secretary of State Hull at Washington on March 9. The accords were summarized by W. T. Stone of the Foreign Policy Association as follows:

1. The Export-Import Bank undertakes to establish acceptance credits for the Bank of Brazil to assist the Brazilian government in lifting restrictions on foreign exchange. These credits, amounting to \$19,200,000, will be repayable in installments over a period of two years. The Export-Import Bank further agrees to co-operate with American manufacturers and exporters in extending long-term credits to facilitate the purchase of American products needed by Brazil to develop its transportation facilities and industrial capacity.
2. The United States Treasury agrees (subject to the approval of Congress) to provide up to \$50,000,000 in gold to the Brazilian government for the establishment of a Central Reserve Bank, repayment to be made from Brazil's future gold production. President Roosevelt will present to Congress a request for the necessary authorization to carry out this loan.
3. The United States further agrees to maintain a financial attaché at its Embassy in Brazil, and to press for legislation authorizing the loan of government experts to assist Brazil in developing non-competitive agricultural products for which a market may exist in this country.
4. In return, the Brazilian government agrees to issue a decree freeing the foreign exchange market for commercial transactions, thus assuring funds for the payment of imports from the United States.
5. Brazil undertakes to resume interest and amortization payments on its dollar bond indebtedness, beginning July 1, 1939. The terms of a "transitional arrangement," covering payments on national, state and municipal dollar bonds amounting to \$357,000,000, will be discussed with the Foreign Bondholders Protective Council, Inc., of New York.
6. The Brazilian government proposes to guarantee American investors' treatment equal to that now or hereafter accorded its own nationals.

Most of these agreements were carried into effect before the end of the year. Contrary to expectations, Brazil made only a token payment on her dollar loans on July 1. Negotiations for the resumption of payments on the Brazilian foreign debts were opened with United States, British and French bondholders late in August but no agreement on terms was reached.

The Brazilian-United States economic accords were followed by events demonstrating closer collaboration in the military and political spheres. After Major Gen. Pedro Aurelio Góes Monteiro, Brazilian Chief of Staff, had accepted invitations to visit Germany and other European countries, a United States military mission headed by Brig.

Gen. George C. Marshall, Chief of Staff of the U.S. Army, arrived at Rio de Janeiro on May 25 to invite General Góes Monteiro to visit the United States. They were enthusiastically received and taken on a tour of inspection of defense establishments in Rio de Janeiro, São Paulo, Santos, Curitiba, Porto Alegre, Bello Horizonte, and Recife. Accompanied by a Brazilian mission under General Góes Monteiro, the North American mission sailed for the United States on the cruiser *Nashville*, June 7. The visitors were feted at Washington and taken on a two weeks' air tour of military and air bases throughout the United States. The Brazilian mission was returned to Rio de Janeiro by air in July. On August 29 General Góes Monteiro announced the indefinite postponement of his projected visit to Europe in view of the military crisis. Five "flying fortresses" of the U.S. Army Air Corps arrived at Rio de Janeiro on November 15 to take part in the 50th anniversary celebration of the republic.

Relations with Germany. These new Brazilian-United States ties were Washington's answer to increasing German commercial and political penetration in Brazil, based largely upon the German barter system. Despite the break in German-Brazilian diplomatic relations in 1938 (see 1938 YEAR BOOK, p. 103) further Brazilian orders for military equipment were placed in Germany early in 1939. In June the two governments appointed new Ambassadors to replace those recalled in 1938. The measures of the Vargas Government against Nazi activities in southern Brazil aroused anger in the Reich, but the Berlin authorities did not allow that to hinder their aggressive drive for Brazilian trade and for a share in the development of Brazilian resources and transportation facilities. But with the outbreak of the European war, the Germans were forced to suspend their air service to South America and their trade with Brazil was for the most part captured by the United States as a result of the Allied blockade.

Neutrality Policy. The Brazilian Government, while apparently sympathetic to the Allies, proclaimed a policy of strict neutrality toward the European conflict. The press, army officers, and even the general public in some of the southern districts were ordered to avoid partisan discussion of the war. Immediate steps were taken to curb profiteering and a National Economic Defense Council was established to protect the economic interests of the country. As in 1914-18, the European war proved a distinct stimulus to domestic manufacturing.

Brazil also joined actively in the measures taken at the Panama Conference of American Foreign Ministers and elsewhere to carry into effect the program of inter-American solidarity developed at the Lima Conference in 1938. In September an Argentine military mission was welcomed on a visit to Brazil and a co-ordinated naval patrol of territorial waters was organized by Argentina, Brazil, and Uruguay.

Other Inter-American Relations. A treaty designed to promote Brazilian-Paraguayan trade, through construction of a railway from Rio de Janeiro to Asunción and other measures, was signed June 25. A month later an important Brazilian-Uruguayan trade treaty providing for better exchange facilities and minimum tariffs was signed. About the same time an agreement was reached with Chile for the exchange of Brazilian sugar for Chilean nitrates. Also see ARGENTINA,

BOLIVIA, PARAGUAY, and URUGUAY under *History*; FAIRS AND EXPOSITIONS; INDUSTRIAL CHEMISTRY; MILITARY PROGRESS; PAN AMERICANISM; PAN AMERICAN UNION.

BREMEN. German liner. See EUROPEAN WAR under *The War at Sea*; SHIPPING.

BREMEN, STATE OF. See GERMANY.

BRETHREN, CHURCH OF THE (CONSERVATIVE DUNKERS). A church established in 1719 at Germantown, Pa., the largest branch of the denomination formerly known as the German Baptist Brethren or Dunkers. Headquarters, Elgin, Ill. Other churches of the group are the Brethren Church (Progressive Dunkers) and the Church of God (New Dunkers). See RELIGIOUS ORGANIZATIONS.

BREWER, GEORGE EMERSON. An American surgeon, died in New York, Dec. 24, 1939. Born in Westfield, N. Y., July 28, 1861, he was educated at Hamilton College (A.B., 1881; A.M., 1884; LL.D., 1916) and at Harvard University Medical School (M.D., 1885). He then worked in hospitals in Boston, Washington, and Baltimore, and in 1887 came to New York where he continued in practice until 1927 when he retired. Thereafter he did research work in anthropology and was a research associate in Somatic Anthropology at the American Museum of Natural History, New York.

In 1892 Dr. Brewer became associated with the College of Physicians and Surgeons, Columbia University, and was successively instructor in surgery (1900-03), clinical lecturer (1903-04), professor of clinical surgery (1904-13), professor of surgery (1913-17). He then resigned to do War Work and was appointed professor emeritus. He saw war service with the medical corps and directed U.S.A. Base Hospital No. 2 (No. 1 General Hospital, B.E.F.) at Étretat, France, and subsequently became chief surgical consultant to the 1st Corps of the 1st Army, A.E.F.

One of America's outstanding surgeons and a recognized authority on cancer, Dr. Brewer was consulting surgeon to many New York City hospitals, including New York City Hospital with which he was associated from 1889 and where he made extensive studies of wound infection and surgical technique; Roosevelt Hospital (1901-13), and Presbyterian Hospital after 1913.

A Fellow of the American College of Surgeons, he had served as president of its predecessor body in 1913, as a founder and first president of the Society of Clinical Surgery, and was president of the American Surgical Association in 1919, and also held membership in leading American and foreign medical organizations. In 1929 Columbia University gave him the degree of Sc.D. Dr. Brewer was the author of *Text Book on Surgery* and *Surgical Diagnosis*.

BRIDGES. Although no new records were established, the year 1939 was an active one in bridge engineering. Several important bridges were opened and a number of others were under construction. At the present time, with bridge activity largely confined to projects of the Highway Era, State highway departments have their own bridge departments and design all such bridges, excepting only those of notable size or unusual type. On these latter special problems, the several consulting offices in the country are usually called in and it is only such works that receive comment in the technical press. The great bulk of bridge building, the smaller bridges of current practice, are thus seldom noted. It is also

clear that subsidies by the Federal Government have constituted a decidedly major factor in the building of all types of highway bridges in recent years, particularly the larger ventures. There will undoubtedly be need for more bridges in the future, but it seems doubtful if the present activity will be maintained in the face of probable reduced Federal support.

Among the bridges opened during the year first honors undoubtedly go to the Bronx-Whitestone suspension, which, because of its strategic position as regards the New York World's Fair, was rushed to completion and opened on April 29. Its 2300 ft. span, without stiffening truss and with graceful towers, makes it one of the most slender and beautiful of recent suspensions. See ARCHITECTURE.

On September 23 the cantilever span over the Mississippi River at La Crosse, Wis., was dedicated. On October 6 the Main Ave. Viaduct in Cleveland was opened—another high level crossing over Cuyahoga River, with a grid floor system, and especially notable because of a 271 ft. plate-girder span in its eastern approach, the longest span of this type in the United States. In November, a continuous truss bridge, with spans of 240, 420, and 240 ft., was opened by the Alabama Bridge Commission. It crosses the Tennessee River between Florence and Sheffield, Ala. Early in December another notable continuous truss span, two openings totaling 840 ft., crossing the Missouri River, was dedicated at Brownsville, Neb. This bridge is an important link on the main Chicago-Denver highway.

Also of interest to bridge builders have been the efforts of the Golden Gate Bridge officials at San Francisco to increase revenue by encouraging greater traffic through decreased tolls. These have been cut from 50 to 40 cents and may be reduced to 35. Traffic has increased 22 and revenue 19 per cent—in part due to closing a competing ferry—but revenue still falls behind the total required to meet expenses.

As the year came to a close a new highway bridge over the Ohio River at Owensboro, Ky., was rapidly nearing completion. With main spans of 278, 750, 629, and 343 ft. and costing \$2,300,000, this bridge is typical of the scale and scope of the many major constructions of the present day.

Pontoon Bridges. Although long used for temporary crossings, particularly in military operations, pontoon bridges have suddenly sprung into importance with the construction of two notable bridges of this type, one over Lake Washington in our own Northwest and the other over the Golden Horn at Istanbul, Turkey. These are unique pioneer works of their kind and their life history will be followed with interest.

Contract was awarded at about $3\frac{1}{4}$ million dollars for the 6551 ft. crossing over Lake Washington early in the year. Approaches will cost another $1\frac{1}{2}$ million. Rapid progress has been made and over two-thirds of the 25 pontoons forming the crossing have been placed in position and anchored. A unique draw span of 200 ft. is provided. The pontoons are of reinforced concrete, 59 ft. wide, built in cellular form with 8 in. walls and varying in length from 117 to 378 ft. It is to be completed by July 1, 1940, again demonstrating the remarkable speed of modern American construction.

The Golden Horn pontoon is a much smaller experiment, 1500 ft. long, but provides a 52 ft. roadway with two 15 ft. sidewalks. The 24 pon-

toons are of steel box construction, each 30 by 82 ft., and a movable section of 4 pontoons is provided in the center. It is interesting to note that the Persian host crossed the Bosphorus some two thousand years ago to attack Greece over a platform suspended by ropes between two lines of anchored boats.

In both cases deep water—100 to 200 ft.—over a deep layer of unsatisfactory mud bottom, made the construction of piers almost impossible or, at least, prohibitive in cost, and thus dictated the use of pontoon construction. The relatively short span at the Golden Horn, however, would normally indicate the possibility of using a suspension type.

Suspension Bridges. The largest span of this type now under construction is the Tacoma Narrows bridge with a span of 2800 ft. The cables of this bridge are only 17 in. in diameter and the construction is so light that the problem of transverse deflection due to wind and of undulations in the floor under a quartering wind become of major importance. Difficulties of this type have been experienced in some of the more recent light highway constructions and recall the very often fatal experiences of earlier pioneer suspension bridge builders. Apparently the cable can be stiffened in its action by reducing the sag, and dampening devices have been used to prevent, or minimize, undulations of the floor. The trend is toward the omission of stiffening trusses, which are not needed for load distribution under highway use in the longer spans, and this omission has materially reduced the stiffness of such bridges under heavy wind loads.

One of the largest suspension bridges outside the United States was completed in May in Southern Rhodesia. Crossing the Zambesi River, the Beit bridge has a span of 1050 ft.

An interesting failure on November 12 of a small span (450 ft.) suspension, built in 1926 over the Rio Grande between Hidalgo and Reynosa, Mex., called attention to the probable corrosion, possibly due to electrolysis, of bridge cables deep in the anchorage masonry where it would not be noted in an ordinary inspection. A temporary wood pontoon bridge was rapidly put in place to supply this rather isolated crossing pending the erection of a new structure.

Cantilevers. Steel erection began in May for a new bridge over the Mississippi River just above Baton Rouge, La. (See FOUNDATIONS, 1938 YEAR BOOK.) This combined railroad and highway bridge will have two channel spans of 588 ft. each with a central anchor span of 650 ft. Another Mississippi River bridge of the same type is under construction at Greenville, Miss. This structure, with a main span of 740 ft. and two side spans of 640 ft. each, will cost about $4\frac{1}{2}$ million dollars.

Another interesting cantilever is the 600 ft. main span with long approaches (see FOUNDATIONS) which will cross Narraganset Bay at Jamestown, R. I. Although this bridge displaces but one of two important ferries, it is estimated that the expected volume of traffic on this main route will carry the cost of the work.

Concrete Arches. The collapse on August 31 of the timber lattice arch, which was to have formed the centering for a single span reinforced concrete arch over the Angerman River between the villages of Lunde and Sando in Sweden, resulted in a loss of 18 lives and brought to a temporary end, at least, the construction of what was to have been the longest concrete arch span in the world—866 ft. When we recall the present record

spans—Plougastel, Brest, France, 590 and Traneberg, Stockholm, 593 ft.—the daring of this project is obvious.

A recently completed twin-cell reinforced concrete arch across the Farsund in Finland, while not a record span, is well up among the greatest spans of this type in the world, 426 ft.

Girders. Note has been made of the 271 ft. record plate girder at Cleveland. An unusual bridge of this type has been under construction in the Appalachian Scenic Highway near Tallulah Falls near Clarkesville, Ga. It is an extremely high structure with hollow, concrete piers and with a continuous girder of 220 ft. center span.

Recent reports indicate that the famous Hawkesbury Bridge, built by American engineers in New South Wales, Australia, in 1889, and remarkable at the time for the great depth of its foundations, must shortly be replaced. The six 410 ft. truss spans are no longer adequate for modern loads and some of the piers have cracked, apparently because of ineffective design or poor maintenance of the expansion bearings at the ends of the trusses.

JAMES K. FINCH.

BRIDGES CASE. Federal proceedings for determining whether to deport Harry B. Bridges were held at San Francisco (July 10 to September 14) before James M. Landis, serving as special examiner for the Department of Labor. The case had both political and social significance: it brought to a focus the sentiment and exertions for and against the expulsion from the United States of one of the most successful and powerful leaders of labor in the country, a man regarded by his opponents as one of the land's most subversive radicals, but whom the C.I.O. had taken into its organization with his thousands of followers among the waterfront employees of the Pacific coast.

Bridges, a native of Australia, entered the United States in 1920. He was reported to have applied for naturalization in 1920 and again in 1928, but to have failed to complete naturalization under each application. In 1934, the year of a violent strike of waterfront and maritime labor in the ports of the Pacific coast, Bridges was denounced as a Communist, and there began an effort to have him deported as a subversive alien, under Federal law. In September, 1937, an Immigration Inspector at Seattle asked for a warrant as a step toward such deportation. The Dies Committee (q.v.) called upon Secretary of Labor Perkins, without success, in the summer of 1938, to proceed for the deportation of Bridges. Action against Bridges was deferred until after the Supreme Court's (q.v.) ruling of Apr. 17, 1939, in the Strecker case, putting on the Government the burden of proving that a person whom the Government would deport was still an actual member of the Communist Party.

The hearings that began under these circumstances on July 10 were those of a unit of the administrative, not of the judicial, branch of the Government; they did not strictly follow the courts' procedure. Normally hearings for deportation were conducted by the Bureau of Immigration in private; in Bridges' case they were held on Angel Island, in the San Francisco area, reachable only by a Government boat, to which reporters but not the public in general had passes. The opportunity for such popular demonstrations as had marked the Sacco-Vanzetti and Mooney

cases was comparatively slight. Witnesses for either side offered great abundance of testimony, totaling over 1,500,000 words. The main outline of the case, however, was simple; the chief points at issue were, whether Bridges had entertained with the Communist Party such relations as constituted affiliation, and whether the Communist Party was an organization advocating the overthrow of the U.S. Government by force. A former labor leader and Communist member named John L. Leech identified Bridges as the same person whom he had twice seen addressing Communist meetings under the name of Rossi; after admitting that he had later signed a statement denying that Bridges belonged to the Communist Party, Leech revoked this denial, explaining that a delegation of three other Communists had called upon him to write the denial and that fear of consequences had forced him to do so. Bridges' counsel produced a purported signed affidavit of Leech containing such a denial, and Leech in turn denied that this was the paper that he had signed. Much expert and other testimony followed, as to whether the document were genuine, whose hand had interpolated some passages, and whether Leech had been bribed. His testimony, corroborated in part by his wife's, ranked first among the accounts of a dozen or more witnesses as to Bridges' having been a Communist. Witnesses for Bridges were brought forward to impair in various ways the credibility of those against him and particularly to establish the view that efforts had been made by an agent of the American Legion to hire accusers. Bridges, on his own account, acknowledged that he had at times sought the aid of the Communist organization for his plans concerning the International Longshoremen's and Warehousemen's Union, but denied that he had ever himself joined the party. Either side brought up men of academic rank to testify that the Communists did or did not intend a violent end to the United States Government.

A report from Examiner Landis was rendered on December 29; it was not made public, and was reported to run to 75,000 words. An accompanying published letter from Landis said that evidence "did not permit the conclusion" that Bridges was a member of the Communist party or affiliated with it.

BRIGHAM YOUNG UNIVERSITY. A coeducational institution at Provo, Utah, founded in 1875 and maintained under the auspices of the Church of Jesus Christ of Latter-day Saints. In the 1939 summer session 608 students were enrolled; in the autumn session enrollment was 2379. The faculty numbered 159 members. The budget for the year was \$428,000, the endowment, \$277,199, and the income (1938-39) \$505,795. During 1939 the construction of a Chapel Building was begun at a cost of \$250,000. President, Franklin Stewart Harris, Ph.D.

BRISTOL, REAR ADMIRAL MARK LAMBERT, U.S.N., RET. An American naval officer, died in Washington, May 13, 1939. Born in Glassboro, N. J., Apr. 17, 1868, he was graduated from the U.S. Naval Academy in 1887. In 1904 he was in charge of the torpedo branch of the Ordnance Department and during 1907-08 commanded the *Connecticut* on a round-the-world cruise. He saw service on the China Station during 1912-13, was then promoted to captain, and placed in charge of the organization and development of the aeronautical division of the U.S. Navy. At this time he was a member of the first National Advisory

Committee for Aeronautics. After the entrance of the United States in the World War he was placed in command of the *North Carolina*, conveying troops to Europe, and in July, 1918 was placed in command of the *Oklahoma*, Battleship Division 6 in Europe. In October, 1918 he was given command of the U.S. Naval Base at Plymouth, England, and was a member of the International Armistice Commission. Relieved of this command in January, 1919 he was made commander of the U.S. Naval Detachment in the Eastern Mediterranean.

On Aug. 12, 1919, Bristol was named U.S. High Commissioner to Turkey, but before embarking on these duties he acted as a member of the international committee of inquiry into the Greek occupation of Smyrna. His work in Turkey, where he was ambassador in all but name, won him high praise from the State and Navy Departments, and in 1921 he was promoted to the permanent rank of rear admiral. In 1927 Admiral Bristol was named the commander of the Asiatic Fleet with the rank of Admiral, and in 1930 he was made chairman of the General Board. His retirement took effect on May 1, 1932. Thereafter, he was Washington representative of the estate of Edward B. McLean.

Admiral Bristol was one of the American delegates to the Lausanne Conference (1922-23), and in December, 1938 was elected president of the American Peace Society.

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE. An association founded in York, England, in 1831, and incorporated by Royal Charter in 1928, for the purpose of fostering the interests of workers in all branches of science, and to give a stronger impulse to scientific research, both theoretical and practical.

The 109th annual meeting, shortened three days by the outbreak of War, was held in Dundee, Scotland, Aug. 30 to Sept. 1, 1939, under the presidency of Sir Albert Seward, who opened the session with an address entitled "The Western Isles Through the Mists of the Ages."

Because of the shortened meeting all the addresses delivered by the sectional presidents were not given, but were taken as read. Those that were delivered were published in the new quarterly series No. 1 of *The Advancement of Science* for October, 1939. The addresses were: "Perspectives in Evolution" by Prof. James Ritchie (zoology); "The Scope and Limitations of Physical Anthropology" by Prof. W. E. Le Gros Clark (anthropology); "The Interpretation of Plant Structure" by Prof. D. Thoday (botany).

Sir Richard Gregory was elected president to succeed Sir Albert Seward, and Newcastle-on-Tyne was selected as the site of the 1940 meeting. The secretary was O. J. R. Howarth, and the headquarters of the Association were at Burlington House, London, England.

BRITISH CAMEROONS. See CAMEROONS, BRITISH.

BRITISH COLUMBIA. The far-western province of Canada. Area, 366,255 square miles; population (1939 estimate), 774,000 compared with (1931 census) 694,263. Chief towns (1931 census figures in parentheses): Victoria, capital (39,082), Vancouver (246,593), New Westminster (17,524), North Vancouver (8510), Trail (7573), Nanaimo (6745), Prince Rupert (6350), Kamloops (6167). During 1937 there were 11,279

births, 7973 deaths, and 6191 marriages. Education (1936-37): 141,382 students in elementary and secondary schools, and 4236 students in schools for higher education.

Production. The gross value of agricultural production for 1938 was \$42,764,000. Crops produced in 1939 included oats (6,039,000 bu.), wheat (1,759,000 bu.), barley (762,000 bu.), rye (120,000 bu.), flaxseed (4000 bu.), hay and clover (314,000 tons), apples (1,941,900 bbl.). Livestock in the province (1939): 314,700 cattle, 168,900 sheep, 68,300 horses, 49,800 swine. Fur production (1936-37): 215,966 pelts valued at \$1,411,668. The output of the forests (1937) was equivalent to 689,747 M cu. ft. valued at \$37,789,995. Fisheries (1938) accounted for 228,143 tons of fish (exclusive of whales and seals) valued at \$18,672,000.

Mineral production for 1938 was valued at \$64,549,130 of which gold (605,617 fine oz.) accounted for \$21,302,578; lead (413,706,307 lb.), \$13,834,339; zinc (229,363,564 lb.), \$9,199,443; copper (65,759,265 lb.), \$6,557,514; silver (11,186,563 fine oz.), \$4,863,582; coal (1,440,287 tons), \$5,237,077. During 1937 the 1713 factories (including those in the Yukon), with 42,576 employees, produced goods valued at \$99,359,051 net.

Government. For the fiscal year ended Mar. 31, 1938, revenue totaled \$31,036,942; expenditure, \$27,672,043. On Mar. 31, 1938, the gross public debt was \$188,946,554 against which the sinking funds amounted to \$36,406,319. The King is represented by a lieutenant-governor (appointed by the Governor General in Council), aided by a ministry of 9 members which is responsible to the legislature and resigns when it fails to hold the confidence of that body. There are 48 members (31 Liberals, 8 Conservatives, 7 Co-operative Commonwealth Federationists, and 2 others elected on June 1, 1937) in the legislature, elected for a 5-year term by adult suffrage. Six senators (appointed for life) and 16 elected commoners represent the province in the Dominion parliament at Ottawa. Lieut.-Gov., Eric W. Hamber (appointed May 1, 1936); Premier, T. D. Pattullo (Liberal).

BRITISH EAST AFRICA. See KENYA, NYASALAND, TANGANYIKA, UGANDA, and ZANZIBAR.

BRITISH EMPIRE. The world's largest empire, comprising an area of 13,353,952 square miles and a population of about 500,775,000. It consists of:

1. The United Kingdom of Great Britain and Northern Ireland. See GREAT BRITAIN; IRELAND, NORTHERN.

2. Self-governing Dominions—AUSTRALIA, CANADA, NEWFOUNDLAND (temporarily administered as a crown colony), NEW ZEALAND, UNION OF SOUTH AFRICA.

3. IRELAND (EIRE), a sovereign, independent state, associated for certain purposes with the United Kingdom and the self-governing dominions, which are sometimes referred to collectively as the British Commonwealth of Nations.

4. INDIA and BURMA.

5. Self-governing colonies—CEYLON and SOUTHERN RHODESIA.

6. Crown colonies and protectorates—ADEN, ASHANTI, BAHAMAS, BARBADOS, BASUTOLAND, BECHUANALAND, BERMUDA, BRITISH GUIANA, BRITISH HONDURAS, BRITISH SOLOMON ISLANDS, BRITISH SOMALILAND, CYPRUS, FALKLAND ISLANDS, FIJI, GAMBIA, GILBERT AND ELLICE ISLANDS, GIBRALTAR, GOLD COAST, GRENADA, HONG

KONG, JAMAICA, KENYA, LEEWARD ISLANDS, MALTA, MAURITIUS, NIGERIA, NORTHERN RHODESIA, NYASALAND, ST. HELENA, ST. LUCIA, ST. VINCENT, SEYCHELLES, SIERRA LEONE, STRAITS SETTLEMENT, SWAZILAND, TRINIDAD AND TOBAGO, UGANDA, ZANZIBAR.

7. Protectorates of a special nature—FEDERATED MALAY STATES, UNFEDERATED MALAY STATES.

8. Mandates held by the United Kingdom—BRITISH CAMEROONS, PALESTINE, TANGANYIKA TERRITORY, TRANS-JORDAN, TOGOLAND (British sphere).

9. Mandates held by Dominions—NAURU (Australia), NEW GUINEA (Australia), SOUTH-WEST AFRICA (Union of South Africa), WESTERN SAMOA (New Zealand).

10. Dependencies of Dominions—LABRADOR (Newfoundland); PAPUA, NORFOLK ISLAND, AUSTRALIAN ANTARCTIC TERRITORY (Australia); UNION ISLANDS OF TOKELAU and ROSS DEPENDENCY (New Zealand).

11. Territories held under condominium—ANGLO-EGYPTIAN SUDAN (United Kingdom and Egypt), NEW HEBRIDES (United Kingdom and France).

See the separate articles on each of the above.

BRITISH EXPEDITIONARY FORCES (B.E.F.). See EUROPEAN WAR.

BRITISH GUIANA, gè-à'na. A British crown colony in northern South America, between Venezuela and Surinam (Netherlands Guiana). Area, 89,480 square miles; population (Jan. 1, 1938), 337,039 including 142,978 East Indians. During 1937 there were 11,227 births (33.3 per 1000), 7367 deaths (21.9 per 1000), and 1812 marriages (10.8 per 1000). Chief cities: Georgetown (capital), 67,448 inhabitants in 1937; New Amsterdam, 9514. Education (1937): 240 primary schools and 52,318 pupils; secondary schools had 1829 pupils enrolled.

Production and Trade. The chief products are sugar, rice, rum, coconuts, coffee, limes, timber, gold, diamonds, and bauxite. Deposits of vegetable pitch and manganese have been found. Livestock (1937): 129,540 cattle, 33,273 sheep, 26,667 swine, 12,497 goats, 7391 donkeys, and 3025 horses. In 1938, imports were valued at \$10,610,262 (flour, cotton goods, sulphate of ammonia, and wearing apparel were the main items); exports, \$13,065,606 of which sugar (183,479 tons) accounted for \$7,573,902; bauxite (376,368 tons), \$2,038,273; gold (39,728 oz.), \$1,030,778; diamonds (33,508 carats), \$377,131. The sugar quota for 1938-39 was set at 188,000 metric tons. There were, in 1938, 79 miles of railway (1,462,891 passengers and 110,977 tons of freight carried), 559 miles of roads, 514 miles of trails, 5300 miles of telephone lines, and 317 miles of telegraph lines.

Government. For 1938, revenue totaled £1,302,520; expenditure, £1,312,177; public debt (Dec. 31, 1937), £4,525,685 against which the sinking fund amounted to £499,083. The British Guiana (Constitution) Order in Council, 1928 (amended in 1935) provided for the government of the colony, and for the introduction of a legislative council of 30 members (the governor as president, 10 official, 5 nominated unofficial, and 14 elected) which was to be dissolved every 5 years, unless previously dissolved, and a general election held. There is an executive council of 10 members (the governor, 2 ex-officio, 4 official, and 5 unofficial; the last 9 must be members of the legislative council). Governor, Sir W. E. F. Jackson (assumed office Jan. 19, 1937).

History. On Feb. 16, 1939 strike disturbances occurred on a sugar estate and 4 persons were killed and 23 policemen were wounded. Work on a number of other estates ceased but after a conference an agreement for procedure in settling disputes was agreed upon by the Sugar Producers' Association and the trade union. Two waterfalls, each 200 ft. wide, one 1600 ft. high and the other 1200 ft. high, were discovered by Dr. Paul A. Zahl of New York City who explored the region around Mt. Roraima.

Trial settlements of 3000 to 5000 carefully selected young men and women with properly equipped technical organization and competent leadership were recommended by the British Guiana Refugee Commission which reported to the Advisory Committee on Political Refugees appointed by President Roosevelt of the United States. The Commission said that British Guiana is not suitable for immediate large-scale settlement. Industrial as well as agricultural development was suggested by the British government who adopted the Report (Cmd. 6014 and 6029; H.M. Stationery Office, London) and said that they were prepared to build the necessary roads and communications, and provide the administrative and other services. It was announced on Sept. 29, 1939, that Malcolm MacDonald, the British Colonial Secretary, had informed the British House of Commons that the outbreak of war had caused a postponement of plans by private organizations to form a corporation to introduce trial settlements of refugees in British Guiana.

BRITISH HONDURAS, hōn-dōō'ras. A Central American British crown colony. Area, 8598 square miles; population (Jan. 1, 1939), 57,767. Chief city: Belize (16,687 inhabitants in 1931). During 1938 there were 2052 births (3.55 per cent), 1178 deaths (2.03 per cent), and 447 marriages (0.77 per cent). In the same year the 111 schools (106 elementary and 5 secondary) had a total of 10,487 pupils enrolled.

Production and Trade. The chief products are mahogany, cedar, rosewood, logwood, chicle, hides and skins (mainly crocodile), cohune nuts, bananas, plantains, citrus fruits, coconuts and copra, maize, sugar, rum, rice, livestock, tortoise shell, shark products, lobsters, sponges, and fish. Forest products represented 80.5 per cent of the total exports by value. In 1938, imports were valued at \$4,004,091; exports, \$3,263,384. The U.S.A. supplied 30.78 per cent of the imports and received 72.84 per cent of the exports. Shipping of all kinds entered and cleared during 1938 totaled 519,480 tons.

Communications. Internal transportation is carried on by means of the numerous rivers except for traffic between the district of Cayo and the Peten district of Guatemala where mules are in use. There were, in 1938, 172 miles of good roads. An airplane service for passengers and freight to Honduras, Guatemala, and other southern points is maintained by the "Taca" Company.

Government. For the year ended Dec. 31, 1938, revenue (excluding \$482,503 paid from the Colonial Development and Loan funds) totaled £1,258,099; expenditure (excluding \$534,545 for Colonial Development grants and Loan works), \$1,337,868; public debt, \$3,337,210 against which the sinking fund for redemption of the funded portion of the debt amounted to \$464,588. According to the British Honduras Constitution Ordinance, 1935 (as amended by Ordinance No. 18 of 1935 and Ordinance No. 21 of 1938) the legislative

council consists of the governor as president, 5 official members, and 8 unofficial members (2 nominated by the governor and 6 elected for 5 constituencies). The executive council, in 1938, included the governor, 3 ex officio members and 5 nominated members (4 were non-officials). Governor and Commander-in-Chief, Sir Alan C. M. Burns (appointed May 18, 1934). See GUATEMALA under *History*.

BRITISH MALAYA. A geographical term for that part of the Malay archipelago extending from 6° 50' north latitude to Singapore. It includes the following political divisions: Straits Settlements (with Christmas and Cocos Islands), Federated Malay States, and Unfederated States. Strictly speaking, the term should include the British controlled states on the island of Borneo (British North Borneo, Brunei, and Sarawak), but the statistics for these political divisions are not included in this article. Total area, 51,977 square miles; population (Jan. 1, 1937), 5,138,000.

Production and Trade. Rubber, tin, copra, pineapples, coconut oil, palm oil, sugar, rice, areca nuts, timber, gold, and resin are the chief products. In 1938, imports were valued at \$554,993,000; exports, \$579,649,000 of which rubber (\$26,911 tons) accounted for \$272,980,376 and tin for \$96,339,078 (\$5 averaged \$0.5692 for 1938). Exports of ilmenite (recovered from the waste material after tin ore has been removed from its alluvium) increased from 50 tons in 1934 to 6461 tons in 1938. Fishing is an important industry. There were 7800 miles of roads in 1939. See FEDERATED MALAY STATES, STRAITS SETTLEMENTS, and UNFEDERATED MALAY STATES.

BRITISH NEW GUINEA. See PAPUA, TERRITORY OF.

BRITISH NORTH BORNEO. A British protected state of Borneo. Area, 29,500 square

miles; population (1938), 299,000. Chief towns: Sandakan (13,826 inhabitants in 1931), the capital, and Jesselton. Education (1937): 4736 students and 49 schools. The chief products are rubber, timber, sago, rice, coconuts, gums, coffee, dried fish, Manila hemp, and tobacco. In 1938, imports were valued at \$6,211,817; exports, \$9,525,132. Finance (1937): revenue, \$3,556,144; expenditure, \$1,797,510 (\$5 averaged \$0.5797 for 1937; \$0.5692 for 1938). The state is administered by the British North Borneo (Chartered) Company. Appointment of the governor (who is responsible to the Court of Directors in London) for British North Borneo is subject to the approval of the British Colonial Secretary. Governor, C. R. Smith (appointed July 17, 1937).

BRITISH SOMALILAND. See SOMALILAND, BRITISH.

BRITISH WEST AFRICA. The British territories in West Africa. See CAMEROONS, BRITISH; GAMBIA; GOLD COAST; NIGERIA; SIERRA LEONE.

BRITISH WEST INDIES. The possessions of Great Britain in the West Indies consisting of (1) Bahamas, (2) Barbados, (3) Jamaica with Turks Islands, (4) Leeward Islands, (5) Trinidad and Tobago, (6) Windward Islands. Consult the separate articles. A review of labor conditions, as well as recommendations for improving the general situation, are included in Major Orde Brown's report entitled *Labor Conditions in the West Indies* (Cmd. 6070; H.M. Stationery Office, London; 1939).

BROADCASTERS, NATIONAL ASSOCIATION OF. See RADIO PROGRAMS.

BROADCASTING STATIONS. A list of the larger broadcasting stations in the United States (i.e. those having 50 kilowatt power) is given in the accompanying table. For an account

of the number of stations licensed and other events of the year, see FEDERAL COMMUNICATIONS COMMISSION. It was expected that some 650 United States stations would receive new frequency assignments late in 1940 as a result of the North American regional broadcast agreement, which went into effect, Dec. 28, 1939. The agreement was concluded by Canada, Cuba, Haiti, Mexico, and the United States for the purpose of eliminating interference between stations. See RADIO; RADIO PROGRAMS.

BROOKINGS INSTITUTION. An organization devoted to public service through research and training in the social sciences. Established in Washington, D. C., in 1927, it maintains as operating units the Institute of Economics, the Institute for Government Research, and a division of training in which only those who have had at least two years of graduate work are accepted as research fellows.

In carrying out its purpose to aid constructively in the development of sound national policies without regard to the special interests of any group, whether political, social, or economic, the Institution conducted during 1939 several significant investigations. The resulting studies were published under the following titles: *Government and Economic Life*; *Reorganization of the National Government*; *British Wages Boards*; *Odd-Lot Trading on the New York Stock Exchange*.

The Institution is supported from endowment funds and annual grants. The officers of the board of trustees for 1939-40 were: Chairman, Dwight F. Davis; vice chairman, Dean G. Acheson; president, Harold G. Moulton; treasurer, Henry P. Seidemann; and secretary, Elizabeth H. Wilson. Headquarters are at 722 Jackson Place, Washington, D. C.

BROOKLYN COLLEGE. A coeducational institution of higher education in Brooklyn, N. Y., founded in 1930 as one of the four institutions of higher learning, supported by municipal taxes and administered by the Board of Higher Education. The others are Hunter College, Queens College, and the City College. The enrollment for the autumn of 1939 was 13,901, of whom 6691 were in the Day Session, 6112 in the Evening Session, 472 in the Division of Courses for Teachers, and 629 in the Graduate Division. The 1939 summer session had an attendance of 3709. The faculty numbered 536 including 20 additions. The amount of endowment and income for the year was \$2,315,407 including the city appropriation of \$1,971,356. There were 63,000 volumes and 480 periodicals in the library. Brooklyn College moved into its new quarters at Bedford Avenue and Avenue H in October, 1937. There are five buildings which will accommodate 7500 students in the day and 7500 in the evening. The cost is \$5,500,000 financed by a PWA loan and grant. The site of 42 acres cost \$1,600,000. The grounds are being landscaped by the WPA. President, Harry D. Gideonse.

BROOKLYN INSTITUTE OF ARTS AND SCIENCES. One of America's oldest and largest institutions for informal education, located in Brooklyn, N. Y. Its public activities are conducted at four centers: The Institute at the Academy of Music, the Central Museum, the Children's Museum, and the Botanic Garden. Founded in 1824, the Institute was incorporated in its present form in 1890. Total membership is about 8000 and is open to everyone.

The Institute at the Academy of Music presents

an annual program of concerts, lectures, forums, and classes of instruction in every major field of the arts and sciences. Approximate attendance at these events for the season 1938-39 was 250,000. The Institute's Museums possess collections in art, ethnology, and natural science. The Central Museum reference library contains more than 27,000 volumes as well as many pamphlets and complete sets of rare periodicals. It includes the Steward Culin Library on Ethnology and the Charles Edwin Wilbour Library on Egyptology. Attendance at both Museums for the year 1939 totaled 486,218. The Institute's Botanic Garden comprises more than 50 acres and plant houses containing tropical and sub-tropical species. The Botanic Garden reference library has over 25,000 volumes and pamphlets. Botanic Garden attendance for the year 1939 totaled 1,798,029.

In 1939 the permanent funds of the Institute amounted to \$4,394,316.53 and the funds to meet current expenses, to \$907,401.24. Under a general reorganization plan adopted in April, 1938, James G. McDonald was named president of the Institute. Other officers are: Edward C. Blum, chairman of the board of trustees; Julius Bloom, associate director of the Institute at the Academy of Music; Laurance P. Roberts, director of the Museums; Mrs. William Lloyd Garrison, 3d, curator-in-chief of the Children's Museum; C. Stuart Gager, director of the Botanic Garden. Executive offices are located in the Academy of Music, 30 Lafayette Avenue, Brooklyn.

BROWN, (MATTHEW) HEYWOOD (CAMPBELL). An American newspaper writer, died in New York, Dec. 18, 1939. Born in Brooklyn, N. Y., Dec. 7, 1888, he studied at Harvard University (1906-10) but did not graduate. He was the son of Heywood Cox Brown and Henrietta Brose Brown. His father, the owner of a printing business, was of English-Scotch descent. Heywood worked as a reporter on the *Morning Telegraph*, New York during 1908-09 and again during 1910-12. He then joined the staff of the *New York Tribune* as a reporter and subsequently as a sports writer, becoming known for his baseball writings. He served as a war correspondent in France in 1917. In 1921 he went with the *New York World*, where he became dramatic critic. During this period he began the column "It Seems to Me," and he remained with *The World* as a columnist until 1928, when in a disagreement with the newspaper over the Sacco-Vanzetti case, the connection was severed. He then joined the Scripps-Howard newspapers, contributing his column to the *New York Telegram* and later to the *World-Telegram*. On Dec. 14, 1939 he left that paper to join the *New York Evening Post*, and on December 15th his first and last column for that paper appeared. A gifted writer, his early columns tended to the whimsical, but after 1924 he broadened the scope of his writings.

His extra-curricular activities were often distressing to his publishers. In 1930 he ran unsuccessfully for Congress on the Socialist ticket; in 1931 he produced a musical comedy, *Shoot the Works* for unemployed actors; in 1933, with other reporters and writers, he organized the American Newspaper Guild and was its president thereafter. He was a founder of *The Connecticut Nutmeg*, which subsequently he took over as *Brown's Nutmeg*.

Besides lecturing on the drama at Columbia University in 1920 and at the Rand School in 1921, and contributing to magazines, Mr. Brown

was the author of *A.E.F.—with General Pershing and American Forces* (1918); *Seeing Things at Night* (1921); *Pieces of Hate* (1922); *The Boy Grew Older* (1922); *The Sun Field* (1932); *Sitting on the World* (1924); *Gandle Follows His Nose* (1926); *Anthony Comstock, Roundsmen of the Lord*, with Margaret Leech (1927), and *Christians Only*, with George Britt (1931).

Heywood Broun's death evoked public expressions of sorrow from many noted persons, including President Roosevelt, Governor Herbert H. Lehman, Mayor Fiorello H. La Guardia and John H. Lewis. He had been associated with Mr. Lewis in many of the latter's labor activities, supporting him with the Newspaper Guild.

Mr. Broun was married to Ruth Hale, president of the Lucy Stone League, in 1917; the marriage ended in divorce in 1933. A year later he was married to Connie Madison Dooley. In the spring of 1939 he became a convert to the Roman Catholic Church.

BROWN UNIVERSITY. An institution of higher education in Providence, R. I., founded in 1764. It is composed of the College, for undergraduate men; Pembroke College, for undergraduate women; and the Graduate School, for men and women. The College includes a division of engineering. The enrollment in the autumn of 1939 was 1416 undergraduate men, 497 undergraduate women, and 340 graduate students. The faculty consisted of 264 members. The endowment of the University was \$11,785,927 on June 30, 1939; the income for the past fiscal year, \$1,815,516. The library contained approximately 552,000 volumes. In the fall of 1939, four courses became the normal program of study in order to allow more coherent effort and less scattering of energy. Comprehensive examinations covering the field of concentration are required for the A.B. degree. A new Infirmary for men and a Health Center for women were opened during the year. Two dormitories were acquired for undergraduate men. An addition to the John Hay Library provides three additional reading rooms and stack space for 150,000 volumes. The circulation increased 30 per cent for the second successive year. A gift of \$200,000 is making possible the restoration of University Hall, the original College Edifice built in 1770. The publication of *Mathematical Reviews*, an international journal of abstracts sponsored by the American Mathematical Society and the Mathematical Association of America, was inaugurated in 1939. A new photographic laboratory will serve subscribers at nominal cost and add to the resources of the distinguished Mathematics library. President, Henry Merritt Wriston, Ph.D., Litt.D., LL.D. See **ARCHAEOLOGY**.

BRUNEI, brōō-nī'. A native state under British protection, in northern Borneo. Area, 2226 square miles; population (Jan. 1, 1938), 35,963. During 1937 there were 1472 births and 772 deaths. Education (1937): 1565 pupils in 25 primary schools. Capital, Brunei (10,453 inhabitants in 1931). The chief products are crude oil, rubber, cutch, jelutong, natural gas, and sago. In 1937, imports were valued at \$2,516,154; exports, \$5,553,428; revenue, \$1,049,293; expenditure, \$565,149 (\$5 averaged \$0.5797 for 1937). Brunei is ruled by a sultan, subject to the advice of the British Resident (under the High Commissioner at Singapore) who has charge of the administration of government. Ruler, Ahmed Tajudin Akharui Khair Wadin (succeeded September, 1924);

British Resident, J. Graham Black (assumed office, January, 1937).

BRUNSWICK. See table of German states in the article on **GERMANY**.

BRYN MAWR COLLEGE. An institution for the higher education of women in Bryn Mawr, Pa., founded in 1885. The enrollment for the autumn of 1939 totaled 635. The teaching staff numbered 100. The productive funds of the college amounted to \$6,639,267, and the receipts for the year 1938-39 were \$923,896. The Library contained 163,500 volumes. President, Marion Edwards Park, Ph.D., LL.D.

BUCKNELL UNIVERSITY. A coeducational Baptist institution of higher learning in Lewisburg, Pa., founded in 1846 under the name of the University of Lewisburg but renamed in 1886 in honor of its benefactor, William Bucknell. In the autumn of 1939 the enrollment was 1276, of whom 815 were men and 461 women. At the junior branch in Wilkes-Barre, Pa., there were 212 students. There were 566 students enrolled in the summer session of 1939. The faculty numbered 95. The productive funds amounted to \$1,387,523.14; the income for the year was \$872,017.82, and the benefactions received were \$363,480.13. The library contained 94,500 volumes. Construction was completed on a \$275,000 addition to the Engineering Building. President, Arnaud C. Marts.

BUDGET. See **PUBLIC FINANCE**.

BUFFALO, THE UNIVERSITY OF. A coeducational institution of higher learning in Buffalo, N. Y., founded in 1846. The enrollment in the various schools for the autumn of 1939 was: Full-time students, 1744; part-time students, 2914. The enrollment for the 1939 Summer Session was 842. The faculty numbered 603. The endowment fund totaled \$5,654,951, and the income for the year (1938-39) was \$1,035,812. The libraries contained 152,477 volumes and 100,099 pamphlets. Chancellor Samuel P. Capen, Ph.D., Sc.D., L.H.D., Litt.D., LL.D.

BUILDING. The year 1939 closed with private building and engineering work going at a fairly satisfactory rate, but public construction was very markedly on the down grade, according

* F. W. Dodge Corporation figures for 37 states east of the Rocky Mountains.

to the F. W. Dodge Corporation, New York. General business and industrial activity, on the up-grade since June, 1939, were given an added stimulus by the outbreak of war in Europe and revision of United States neutrality legislation. The war's effect on private construction so long

as the United States remains neutral is apt to be indirect. From information covering 37 eastern states of the United States, non-residential construction contracts based on 10 months data was estimated at \$958,000,000 or 11 per cent less than in 1938; while the total residential contracts amounted to \$1,340,000,000 or 36 per cent more than in 1938. The value of new contracts for both residential and non-residential building in 1938 and 1939 is shown month by month in the foregoing table.

The cumulative valuation of building permits, compiled by Dun & Bradstreet, Inc., of 215 cities during 11 months of 1939 amounted to \$1,164,144,313, representing a 10 per cent rise from the \$1,057,961,233 for the same period last year. All sections, except the Middle Atlantic States, showed gains over last year; these ranged from 10.4 per cent in the Pacific group to 51.6 per cent for the East Central group.

BUILDING PERMIT VALUES OF 215 CITIES IN THE UNITED STATES

(Compiled by Dun & Bradstreet, Inc.)

| Geographical Groups | Eleven Months | | % Change |
|---------------------|-----------------|-----------------|----------|
| | 1939 | 1938 | |
| New England . . . | \$71,230,418 | \$54,782,879 | +30.0 |
| Mid. Atlantic . . . | 333,913,123 | 429,292,103 | -22.2 |
| South Atlantic . . | 128,610,423 | 96,570,735 | +33.2 |
| East Central . . . | 237,489,504 | 156,665,804 | +51.6 |
| South Central . . . | 125,841,565 | 97,556,967 | +29.0 |
| West Central . . . | 65,659,341 | 44,853,060 | +46.4 |
| Mountain | 24,793,733 | 18,332,458 | +35.2 |
| Pacific | 176,606,206 | 159,907,227 | +10.4 |
| Total U S | \$1,164,144,313 | \$1,057,961,233 | +10.0 |
| New York City . . . | \$221,679,158 | \$343,039,249 | -35.4 |
| Outside N Y C . . . | \$942,465,155 | \$714,921,984 | +31.8 |

At the end of 1939's building season the Federal Housing Administration (FHA) reported that approximately 150,000 non-farm dwelling units were built in the past year, a gain of 30 per cent over 1938 and the highest for any year since 1929. The construction of new single-family homes possibly will equal or surpass the number built in 1929. Insurance of new home mortgages by the FHA will show a gain of about 40 per cent over 1938 and will total the largest volume in its five-year history. An average of between 2500 and 3000 small homes have been started under FHA inspection each week from May to October or during the building season of 1939. By the end of the year more than 2,000,000 people were living in houses built or financed under the FHA's home-ownership program, and almost 100,000 more in large scale housing projects built for rent under the FHA program.

Urban residential construction in the United States, according to the Federal Home Loan Bank Board, reached a nine-year peak in 1939, the first billion-dollar year since 1930, and only unexpected adverse influences resulting from the European war can prevent expanding activity in 1940. In spite of uncertainties arising out of the war, the outlook for construction of new homes and the improvement of existing ones appears good. The volume of applications on homes to be built under FHA inspection in 1939 ran well ahead of the previous year. Renewed public confidence in the values of home ownership, as the result of the lower interest rates and long-term amortized loans—direct reduction loans which provide for the liquidation of mortgages in a definite, specified period—was cited as as-

surging an increasing volume of building in the near future.

Analyzing certain building trends in the United States during 1939, the national secretary of the American Institute of Architects states: "One of the outstanding factors was the continued decline in population in the large civic centers and the steadily increasing development of the suburban areas. Attention is called to the apparently rising tendency to raze business properties which are no longer paying investments to provide parking spaces and the tearing down of many residential properties to reduce taxes. The destruction of large structures formerly well tenanted and returning substantial incomes, means a reduction in municipal tax returns, and presents a serious problem for city governments. Capital investments in new construction during 1939, other than housing, lagged behind normal. Industrial building, which has slumped for several years, showed increasing activity toward the end of 1939. Building materials may be expected to advance in price with an increase in demand, but as long as there is a sufficient supply of building mechanics to meet the demand it is not likely that wages will advance materially." See also ARCHITECTURE; BUSINESS REVIEW; HOUSING.

CHAS. H. HUGHES.

BULGARIA. A Balkan monarchy. Capital, Sofia. King in 1939, Boris III, who succeeded to the throne Oct. 3, 1918.

Area and Population. Area, 39,825 square miles; estimated population on Dec. 31, 1938, 6,371,000 (1934 census, 6,077,939). The estimated population of Sofia in 1937 was 350,000 (with suburbs); of other cities in 1936: Plovdiv (Philippopolis), 125,000; Varna, 75,000; Ruse (Rus-chuk), 51,000; Burgas, 30,000. Living births in 1938 numbered 141,967 (22.4 per 1000); deaths, 85,167 (13.4 per 1000); marriages, 53,043 (8.4 per 1000).

National Defense. The army has a peacetime strength of about 60,000 officers and men and a wartime strength of about 500,000. The military restrictions imposed on Bulgaria by the Treaty of Neuilly in 1919 were removed July 31, 1938. In 1939 Bulgaria was weak in airplanes and modern armaments but was rearming rapidly. See *History*.

Education and Religion. According to the 1934 census, 20.4 per cent of the male and 42.8 per cent of the female population were illiterate. There were 7782 schools of all kinds with 1,086,849 students in 1937-38, including 5325 elementary schools, with 659,633 pupils, and 2 universities, with 7914 students. The religious affiliations of the population at the 1934 census were: Orthodox (State) Church of Bulgaria, 5,128,890; Moslems, 821,298; Jews, 48,398; Roman Catholics, 45,704.

Production. Agriculture and fishing support about 80 per cent of the population. Production of the chief cereals in 1939 was (in metric tons): Wheat, 1,936,500; barley, 333,800; rye, 245,700; oats, 127,900; corn (1938), 532,300. Production of other crops in 1938 was (metric tons): Rice, 19,100; potatoes, 63,500; beet sugar (1938-39), 21,000; tobacco, 17,200; cotton-seed, 15,800; rape-seed, 20,600; cotton, 6900. The 1938 wool clip was 9600 metric tons; raw silk, 182 metric tons. Other production in 1938 was (in metric tons): Cement, 194,000; lignite, 1,941,000; coal, 145,000; salt, 77,000; iron ore, 11,000. There is little manufacturing.

Foreign Trade. Imports in 1938 totaled 4,934,193,000 leva (4,985,914,000 in 1937); exports, 5,578,341,000 leva (5,019,499,000). The 1938 imports from Germany were 2,563,326,000 leva; Italy, 370,135,000; United Kingdom, 348,325,000; Czecho-Slovakia, 291,529,000; Poland, 275,578,000. Exports to Germany were 3,284,107,000 leva (2,364,580,000 in 1937); to Italy, 422,439,000; Poland, 318,208,000; United Kingdom, 267,051,000; Czecho-Slovakia, 255,085,000. See **IMPORTS AND EXPORTS**.

Finance. Final budget returns for 1938 showed total receipts of 7,721,600,000 leva, including loans of 43,100,000, and total expenditures of 7,207,000,000. Estimates for 1939 balanced at 7,829,300,000 leva with the aid of loans of 290,200,000 leva. The public debt on Dec. 31, 1938, was 21,778,900,000 leva (internal, 8,815,500,000; external, 12,963,400,000). The lev exchanged at \$0.0124 in 1938.

Transportation. The railways, all state-owned, had 2109 miles of standard and narrow-gauge line in 1938. The railway budget for that year was: Receipts, 2,162,788,136 leva; expenditures, 2,133,054,698 leva. Highways extended 16,354 miles in 1939 (see **ROADS AND STREETS**). The tonnage of vessels entering the ports with cargo in 1938 was 1,572,000 (1,440,000 in 1937). Air lines connect Sofia with the leading European cities.

Government. The Constitution of 1879 remained suspended from the Georgiev coup d'état of May 19, 1934, through 1939. All political parties were dissolved in 1934 and the formation of new ones was prohibited. King Boris ruled as virtual dictator after overthrowing Premier Georgiev's dictatorship on Jan. 22, 1935. The new Parliament elected in March, 1938, was deprived of practically all legislative powers. As the former political parties were not permitted to present candidates or otherwise participate in the campaign, the deputies were elected on a personal basis and government manipulation of the electoral machinery produced a pro-government majority of 104 out of 160 deputies (see 1938 **YEAR BOOK**, p. 111). For 1939 developments, see *History*.

HISTORY

Internal Developments. King Boris and his supporters continued to hold the balance of power in Bulgaria throughout 1939. The European war strengthened the King's position and enabled him to tighten his grip on Parliament in elections at the end of the year. In addition to rebuffing the drive of opposition parliamentarians to regain their former legislative powers, the King, working through the Cabinet led by Premier George Kiosseivanov, successfully combatted hostile extremists of both the Left and Right.

Communist and other ultra-radical political activities were harshly repressed. Many alleged Communists were arrested for shouting "seditious slogans" during the May Day labor demonstrations in Sofia. Another periodic round-up of Communists was announced on December 1. The various Fascist movements, mostly modeled on German Nazism, likewise felt the government's heavy hand. Some 30 leading members of the disbanded Tsankov party were arrested on February 28 for illegal political activity. On April 11 the government dissolved another Nazi organization, supported from Germany. Two other groups espousing Nazi principles—the Ratnizi party and the National Legion—were banned as criminal organizations on Sep-

tember 27 following anti-Jewish rioting in Sofia.

The Kiosseivanov Cabinet, containing only two members of Parliament, found itself in constant friction with the anti-government deputies. On April 13 the Opposition walked out of Parliament in a body when the Premier refused to discuss foreign policy. With the outbreak of war, King Boris sought to obtain wider support for his government. The Kiosseivanov Cabinet resigned on October 19, giving the King an opportunity to consult leaders of all the former political groups on Bulgarian domestic and foreign policy. On October 23 Boris asked Kiosseivanov to form another Ministry. It contained six holdovers from the previous Ministry but only one member of Parliament and none of the political leaders consulted by the King.

The following day, on the eve of another session, the government dissolved Parliament and called new elections, beginning December 24 and continuing on Jan. 14, 21 and 28, 1940. The government captured 23 out of 27 seats filled in the voting on December 24 and an overwhelming government majority was forecast for the new Parliament. It was indicated that as soon as Parliament assembled, Premier Kiosseivanov would ask for long-term emergency powers similar to those granted Premier Daladier in France.

Foreign Policy. The rapprochement of Bulgaria and Yugoslavia beginning in 1933 and the subsequent trend toward better relations with the other members of the Balkan Entente—Greece, Rumania and Turkey—was reversed in 1939 as a result of German and Soviet expansionist policies which revived Bulgarian hopes of regaining territories lost to the neighboring countries in the Balkan and World Wars. Premier Kiosseivanov set forth Bulgaria's specific territorial claims for the first time in a speech of Apr. 20, 1939, as follows: 2970 square miles from Southern Dobruja in Rumania, 2363 square miles in Eastern Greece whose cession would give Bulgaria access to the Aegean Sea, and 900 square miles from Yugoslavia (see map in 1938 **YEAR BOOK**, p. 288, for an approximation of these territories).

German Pressure. The Sofia Government was under constant political pressure from Bulgarian nationalist sentiment to obtain revision of its boundaries at any cost. While announcing on April 20 a policy of non-alliance and neutrality, the Kiosseivanov Government followed a mildly pro-German foreign policy throughout the first three quarters of 1939. This policy was inspired partly by Nazi promises of assistance in pressing Bulgarian territorial claims against Rumania and Greece (but not against Yugoslavia) and partly by the threat of German military and economic reprisals if Bulgarian politico-economic co-operation was not forthcoming.

Bulgarian revisionist claims were vigorously supported by the German press during a state visit by Premier Kiosseivanov to Berlin early in July. It was reported that the Reich sought to draw Bulgaria, Hungary and Yugoslavia into a "little axis" based upon territorial aggrandizement at the expense of Rumania and Greece, with German aid. Yugoslavia's refusal to accept the bait and Bulgaria's growing fear of economic and political vassalage to the Reich nullified this plan. On the return trip from Berlin, Premier Kiosseivanov stopped in Yugoslavia for conferences with Premier Cvetkovitch and the Chief Regent, Prince Paul. The two Premiers issued a formal statement asserting that "a policy of

independence and neutrality best answers the interests of Bulgaria and Yugoslavia and of peace in the Balkans."

Sofia's fear of the Reich was reflected in the severe measures taken against Nazi political activities within Bulgaria and in efforts to restrict the virtual German monopoly of Bulgarian foreign trade. Hitler's representatives in Sofia brought extreme pressure upon the government to sell the bulk of the country's export surplus to the Reich. Bulgarian agricultural and mineral products were paid for in "ASKI" marks, good only in Germany. The result was that Bulgaria was flooded with German manufactures, many of which it did not want. In a letter to the *New York Times* of Dec. 3, 1939, a leading Bulgarian complained that the intensive exports forced upon his country by Germany were destroying its economy and that notwithstanding these exports, the Reich still owed Bulgaria six billion leva "which she has no intention of paying." On the other hand, continued shipments of German arms to Bulgaria aroused the suspicions and fears of Bulgaria's neighbors.

Relations with Other Powers. To create a counterweight to Germany's growing influence, the Sofia Government concluded a cultural and economic treaty with Italy on November 5. For the same reason it encouraged Anglo-French efforts to woo Bulgaria away from the Reich by extending commercial preferences and credits. But an Anglo-French offer to guarantee Bulgaria's independence was rejected. The British and French actively supported efforts by Turkey, Yugoslavia, Greece, and Rumania to induce Bulgaria to join the Balkan Entente (q.v.). Bulgaria, however, demanded the Dobruja from Rumania and Thrace from Greece as the price of its adherence. This price Rumania and Greece were unwilling to pay, and the negotiations were in consequence deadlocked at the year end.

Meanwhile Bulgar-Rumanian relations were worsened by sporadic frontier clashes and by a Bulgarian agitation against alleged Rumanian attacks upon Bulgars in the Dobruja. As a warning to Bulgaria not to resort to armed force Greece, Turkey, and Rumania in September mobilized troops along the Bulgarian frontiers and strengthened their fortifications.

Soviet Role in Bulgaria. At the beginning of the last quarter of 1939, Bulgarian hopes for aid in regaining the lost territories switched from Germany to the Soviet Union. The Soviet Government made overtures toward Bulgaria by sending the Vice Commissar of Foreign Affairs to Sofia in May. In August the first official Bulgarian delegation to visit the Soviet Union since the World War, consisting of a large group of deputies, went to Moscow. There they received the personal assurance of Premier Molotov that the Soviet Union approved Bulgaria's territorial claims upon Rumania. Sofia was one of the few European capitals that greeted the Soviet-German rapprochement with satisfaction. In September Bulgarian missions were sent to the Soviet capital to negotiate agreements for closer commercial and air communications. Meanwhile assurance of Soviet friendship encouraged the Bulgarians to adopt a more independent attitude in trade negotiations with Germany.

Bulgaria's first reaction to the Soviet expansionist policy inaugurated in September was one of relief and hope. Historically Russia had been the friend of Bulgaria and the deep-seated Pan-

Slav sentiment among the Bulgarian peasants and some intellectuals furthered the belief that Russia planned to seize Bessarabia from Rumania and at the same time aid Bulgaria to take the Dobruja.

The expectation that Russian help would not come so high as that offered by Germany soon faded. It was reported late in October that Moscow had refused to support Bulgarian claims on Rumania unless some pro-Soviet ministers were admitted to the Kiosseivanov Cabinet. A new Soviet Minister arrived in Sofia on October 31. The activities of the Soviet Legation, equipped with the largest staff of any foreign diplomatic delegation in Sofia, aroused the fear of the Bulgarian Court circles and the ruling groups that Moscow planned to communize Bulgaria from within and use the country as a base for Soviet domination of the Balkans. Soviet policy in the Baltic States and the aggression upon Finland supported this belief.

In consequence the Bulgarian Government, in November, adopted toward Russia much the same policy as toward Germany. The campaign for territorial revisions by armed force was dropped temporarily and Sofia supported the Balkan Entente's efforts to maintain the neutrality of all the Balkan states in the European war. Sofia students omitted the customary vociferous demonstration against the Treaty of Neuilly upon the 20th anniversary of that treaty (November 27). On November 10 a Bulgar-Turk agreement for partial demobilization and withdrawal of troops from their mutual frontier was announced. Bulgaria, which had been supporting an army of 200,000 men on a war footing at a cost of 1,000,000 leva daily, was reported to have reduced this force to about 120,000 men.

At the same time Bulgaria followed an ostensibly friendly policy toward Russia in order to avoid any pretext for a Soviet invasion. In mid-November *Izvestia*, official organ of the Soviet Government, was placed on sale in Sofia for the first time. On December 24 the Bulgarian Finance Minister and a delegation of financiers and economists went to Moscow to continue the negotiations for a trade and maritime treaty. Repressive measures against Bulgarian Communists were not relaxed, however. And unofficially Bulgarian sentiment revealed itself as increasingly favorable to the Anglo-French cause. Thus Bulgaria at the year end was still sitting on the diplomatic fence, waiting for future developments to determine its course in the European conflict.

BURMA. A British dependency, formerly one of the British provinces of India. Total area, 261,610 square miles comprising Burma proper, with Chin Hills and Kachin Hills Tracts (192,158 sq. mi.), Shan States (62,335 sq. mi.), and unadmin-

istered territory (7117 sq. mi.). Total population (Dec. 31, 1937 estimate), 15,797,000 compared with (1931 census) 14,667,146 (84.3 per cent Buddhists, 5.2 per cent Animists, 4 per cent Mohammedans, 3.9 per cent Hindus, and 2.3 per cent Christians). Chief cities (1931 populations): Rangoon (capital), 400,415; Mandalay, 147,932. Education (1937-38): 7639 recognized schools and colleges (568,037 students) and 18,436 unrecognized schools (212,975 students).

Production and Trade. Rice, sesamum, maize, jowar (Indian millet), cotton, beans, groundnuts, and grain are the main agricultural products. The area sown in 1936-37 totaled 18,165,172 acres. Irrigated lands totaled 1,477,994 acres. Forest reserves covered 31,339 square miles and the output of teak therefrom in 1936-37, by lessees, amounted to 345,793 tons. Rice (rough) produced from 12,522,900 acres in 1938-39 totaled 8,173,100 metric tons. Burma is rich in minerals, the most important being (1938 production figures, in metric tons) petroleum (1,049,000), lead (88,000), zinc (55,700), tungsten (1900), tin (4100), silver (184), rubies, jadestone, wolfram, gold, and copper. A total of 87,652 were employed during 1939 in the 986 factories of all kinds. In 1938, imports were valued at Rs206,700,000; exports, Rs470,600,000 (rupee averaged \$0.3659 for 1938).

Communications. In 1938 there were 13,421 miles of roads, 2060 miles of railways, and some 60 miles of navigable canals. The great river Irrawaddy (navigable for 900 miles from the sea) and its tributaries (the Chindwin, Shweli, and Myitnge) form an important artery of commerce. A highway links the railhead at Lashio of the Burma railways with the new Chinese highway which runs through Yunnan province to the Chinese capital of Chungking. This provides a new supply route (Rangoon to southwestern China) in place of the blockaded Chinese Pacific ports and the route through French Indo-China over which the transport of munitions was prohibited. Owing to a lack of traffic, the Irrawaddy Flotilla and Airways Ltd., suspended all their seaplane services (Rangoon-Yenangyuang and Rangoon-Moulmein-Tavoy).

Finance. For the year ended Mar. 31, 1938, revenue totaled Rs158,400,000; expenditure, Rs145,400,000. Estimates for 1938-39 indicated revenue of Rs158,083,000 and expenditure of Rs154,229,000. Burma's debt to India was calculated to be Rs507,981,000 on Mar. 31, 1937. The annuity required to redeem the principal and interest of this debt in 43 years from 1939-40 amounts to Rs22,456,000 after taking into account the payments made by Burma to India in 1937-38 and 1938-39. In addition, Burma has to pay annually $7\frac{1}{2}$ per cent of the liability of India in respect to central government pensions in force at the date of separation.

Government. The Government of India Act, 1935, provided for the separation of Burma from India on April 1, 1937. Executive power is vested in a governor (appointed by the Crown) who is advised by a council of ministers of not more than 10 members. There is a legislature, having power over Burma's internal affairs, consisting of a senate of 36 members (18 elected by the house of representatives and 18 chosen by the governor) and a house of representatives of 132 members elected by popular suffrage. Large areas in the northern and eastern hill districts were excluded from the legislature's control and placed under the jurisdiction of the governor. Governor, Sir

Archibald D. Cochrane (assumed office on May 8, 1936; reappointment, effective Apr. 1, 1937).

History. Unrest of sections of the population which was marked by rioting (see 1938 YEAR BOOK, pp. 112-113), strikes, and civil disobedience campaigns during 1938, continued into 1939. In Mandalay, on Feb. 10, 1939, in defiance of an order prohibiting a demonstration, 20,000 persons formed into an unruly procession and clashed with the military police who were trying to restore order with the result that 24 people were killed and several were injured. The British Under-secretary of State for India and Burma, in a speech delivered at London on February 16, said that it was hard to name any one predominating cause of the disturbances in Burma and, among other things, added that the situation where a "vast amount of land was in the hands not only of absentee, but alien (Indian) landowners, could not in these days of economic and nationalist thought fail to give rise to common difficulties." A new coalition cabinet headed by U Pu succeeded that of Dr. Ba Maw at the end of February. Hindu-Moslem riots broke out in Rangoon early in March and a number of persons were killed or injured. Soldiers and military police patrolled the street to restore order.

The committee set up by the Burma government to inquire into the causes of the 1938 riots, in a report issued during April, 1939, found that while the re-publication of an offensive attack on Buddhism started the outbreaks, the underlying causes were social, economic, and political. It emphasized the misbehavior of a large minority of Buddhist monks who played a leading part in the disturbances. Some of the recommendations of the committee were: That the whole question of the Indians in Burma should be re-examined; the recommendations of the land and agricultural committee should be taken to heart by the government with the object of restoring the former prosperity and contentment of the peasantry; the state of the police to be examined by a competent commission; stricter control of the vernacular press (the committee noted the astonishing credulity of the masses who swallowed the most fantastic tales of Indian attacks on Buddhist temples and the poisoning of groceries by Indian shopkeepers). The committee urged "the need to establish and define once and for all the relations of the monks and the state," and pointed out that the rule of law must be recognized as a necessary condition of progress if Burmese Buddhism is to retain its influence for good, because, Burma "has now become a democracy in which superstition is no substitute for thought and ideals must be enforced by reason."

The movement for greater self-government was further stimulated in 1939 by the outbreak of the European War and the Indian National Congress's demand for independence (see INDIA under *History*). A group of Burmese political leaders, in a letter to the British Governor, asserted that Burma deserved and was capable of assimilating "a larger measure of reform than India." The Governor replied on November 7 that Burma's problems were different from those of India, but that the British Government did not consider them to be insurmountable obstacles to Burma's ultimate attainment of "her due place in the British Commonwealth of Nations."

This statement was attacked as vague and unsatisfactory by the Burmese press and some political leaders, who pointed out that it did not

go as far as the British promise of dominion status to India after the European war. After further consultations, the Governor stated officially on November 24 that the British Government recognized that the natural outcome of Burma's constitutional progress would be the attainment of dominion status.

Relations between China and Burma assumed importance during 1939 as a result of the opening of the Chinese military supply highway connecting the Burmese border with Chungking. The Chinese Minister of Communications conferred with Burmese officials in Rangoon in May and in December the visit was returned by the defense secretary and the director general for posts and telegraphs for Burma, both Britons. In addition, an unofficial Burmese goodwill mission comprising delegates of leading Burmese civic organizations, arrived in Chungking by air on December 12.

BURYAT-MONGOLIAN REPUBLIC.
See RUSSIAN SOVIET FEDERATED SOCIALIST REPUBLIC.

BUSCH BECERRA, GERMÁN. President of Bolivia, died at La Paz, Aug. 23, 1939. Born at San Javier, Santa Cruz, Mar. 23, 1904, he was educated at the Colegio Nacional "6 de Agosto" of the Department of Beni and at the Military College of La Paz (1922-26). Entering the army, he was promoted to lieutenant in 1931, captain in 1932, and major in 1933, becoming aide to the commander-in-chief of the Bolivian forces in the Chaco. In 1934 he became chief of the General Staff of the First Army Corps.

One of the heroes of the Chaco War, Colonel Busch led a bloodless coup d'état against the Sorzano Government on May 17, 1936 and placed in the presidency, Col. David Toro, another of the Bolivian heroes of the Chaco War. A year later—July 14, 1937—Toro was ousted and Busch chosen as his successor. He announced that his Government would follow a "middle of the road" policy, and on August 1 he restored the 1880 Constitution and called for elections to the National Assembly. On May 27, 1938 the newly elected Assembly elected him constitutional president for a six-year term. Although he attempted his reforms of the government through constitutional methods, he gradually veered to a dictatorship of the "right" and in April, 1938 he outlawed "all Communist, Anarchist, and Bolshevik activity," and on April 24, he suspended the Constitution, assumed a "totality of power," and became the dictator of Bolivia. On Aug. 23, 1939, it was announced that he had committed suicide.

During his regime, he undertook the reform of the economic and financial fields by a three-point program, which called for the revision of the rates of exchange, the establishment of an Agricultural Bank, and the balancing of the budget; the cancellation of the Standard Oil Petroleum concession was approved and the Treaty of Peace, Friendship, and Boundaries, which ended the Chaco dispute, was signed on July 21, 1938; treaties were signed with Argentina, Brazil, Chile, and Peru. See BOLIVIA under History.

BUSES. See AUTOMOBILES.

BUSINESS REVIEW. Business activity in the United States during 1939 passed through three distinct phases. First, there was a decline from the high level of production of December, 1938, which continued until the late spring. The adjusted index of industrial production of the Federal Reserve Board, which was 104 in December, dropped to 92 in April and May. The recession,

which resulted in part from the concentration of public works and other Government spending activities late in 1938, was intensified in its later phases by a protracted coal strike. Business conditions entered upon a new phase beginning with June, when the recovery that started in the middle of the year before was resumed as the high level of retail trade and building activity led to an expansion of orders for primary industries. This gradual recovery, which brought the adjusted index of industrial production back to 103 in August, was followed by a spectacular upturn immediately following the outbreak of the war in Europe. The last three months of 1939 was the most prosperous quarter on record, in terms of the adjusted index of industrial production of the Federal Reserve Board, except for the second and third quarters of 1929.

The beginning of the war in Europe did not stimulate American business directly to any significant extent. Export trade was affected relatively little. Rather, the war stimulated industrial activity indirectly because it led to a widespread forward buying movement on the part of manufacturers, distributors, and consumers generally. Remembering the sharp price advances and the interruptions in delivery which accompanied the World War, a rush to buy goods developed during September which did not abate materially until near the end of the year. Industry thus built up large backlogs of unfilled orders which caused most lines of manufacturing to operate around capacity levels right through the final months of the year, when usually there is a seasonal recession in activity. Hence, the adjusted index of industrial production in December reached 128, which surpassed the previous monthly peak of 125 reached in June, 1929, for the first time.

The primary stimulus to business thus became forward buying, and government spending to promote recovery became a less important factor. In fact, some curtailment in relief outlays occurred during the latter part of the year, in contrast with the expansion of Federal pump-priming expenditures late in 1938, and the upturn in residential construction, while it continued through the year, assumed a much slower pace.

The course of business activity during 1939, with comparisons with previous years, was reflected in the adjusted index of industrial production of the Federal Reserve Board as follows:

INDEX OF INDUSTRIAL PRODUCTION FEDERAL RESERVE BOARD

[Adjusted for seasonal variations; monthly average 1923-25 = 100]

| Months | 1934 | 1935 | 1936 | 1937 | 1938 | 1939 |
|-----------|------|------|------|------|------|------|
| January | 78 | 90 | 97 | 114 | 80 | 101 |
| February | 81 | 89 | 94 | 116 | 79 | 99 |
| March | 84 | 88 | 93 | 118 | 79 | 98 |
| April | 86 | 86 | 101 | 118 | 77 | 92 |
| May | 86 | 85 | 101 | 118 | 76 | 92 |

| 1927 | 106 | 1933 | 76 | 1939 | 105* |

* Preliminary.

Despite the fact that the primary stimulus to the upturn came from the beginning of the war in Europe, the acceleration in activity made itself manifest in virtually all lines of business. Not only the armament industries, but practically every major industry in both producers' goods and consumers' goods fields received a flood of orders from buyers who feared higher prices or delivery delays because of the war. Industries that consume steel, for example, feared that armament orders might book steel manufacturing companies so far ahead that they would not be able to serve their regular customers on schedule. Hence, even where price increases were not feared, buyers bought freely to cover future requirements. Because industry generally had become accustomed to hand-to-mouth buying policies, particularly following the 1937-38 recession, this change was particularly marked. Only in the final weeks of the year, when it became apparent that belligerent countries would seek to hold their purchases from the United States to a minimum, in order to conserve foreign exchange, did buying policies again take a more conservative turn.

The volume of production of six major industries, with comparisons with previous years, is shown in the following table:

INDICES OF ACTIVITY IN CHIEF INDUSTRIES

| | <i>Iron and steel</i> ^a | <i>Bituminous coal</i> ^a | <i>Freight car loadings</i> ^a | <i>Construction</i> ^a | <i>Automobiles</i> ^a | <i>Electric power</i> ^b |
|-----------|------------------------------------|-------------------------------------|--|----------------------------------|---------------------------------|------------------------------------|
| 1929 | 130 | 102 | 107 | 117 | 135 | 105.2 |
| 1930 | 94 | 89 | 92 | 92 | 85 | 99.7 |

^a Board of Governors of Federal Reserve System (adjusted for seasonal variations), monthly average 1923-25 = 100.

^b Monthly average of *Annalist* (computed normal = 100).

Industry. Construction. As is usually true of a period of expanding business, the durable goods industries enjoyed the widest gains. New construction, which assumed the leadership in the upturn from the 1937-38 recession during the previous year, again enjoyed wide gains. Public works activity reached a peak early in the year and then declined, but residential construction, including the extensive slum clearance program of the United States Housing Authority, continued at a high level through 1939. Furthermore, later in the year building by public utilities and industrial concerns increased sharply, after having remained at a low ebb for a number of years. The value of new contracts for both residential and non-residential building in 1938 and 1939 is shown month by month in the table under BUILDING.

Iron and Steel. The iron and steel industry operated at virtual capacity levels during the final months of the year. Expectations of a general

price increase, which did not materialize, stimulated buying and gave the steel companies large backlogs of unfilled orders which they could not complete by the end of the year. On the other hand, concessions to foreign buyers and to large domestic consumers which had been available before September disappeared, so that the steel companies did obtain a materially higher average price for their products. See IRON AND STEEL.

Automobile. The automobile industry realized the increase in sales it had confidently expected for 1939. Following the sharp decline in car buying during 1938, a deferred replacement demand had been built up which brought a favorable reception for both 1939 and 1940 model automobiles. Production of cars and trucks in the United States and Canada during 1939 aggregated 3,710,000 cars and trucks, which compared with 2,655,171 cars and trucks in 1938 and 5,016,000 units in 1937, which was the best year since 1929. The only untoward development for the year was the strike which closed down the Chrysler Corporation plants from the opening of the new model season to early in December. The end of the year found the industry in a healthy position as regards inventory and demand prospects. See AUTOMOBILES.

Other Industries. Consumer goods industries, under the leadership of textiles, similarly rose to peak levels. An increase of approximately 100 per cent in the price of silk, due to reduced supplies from the Orient and increased consumption within Japan because of restrictions on cotton goods use within the country, brought a further shift in demand from silk to rayon textiles. Other important shifts in demand were noted during the latter months of the year as a result of sharp price advances in particular markets due to the war. For example, the huge demand for burlap from Great Britain, to make sandbags for defense purposes, caused consumers in this country to shift largely to cotton and heavy paper bags.

Only a few industries were affected adversely by the outbreak of the war. The motion picture industry particularly was hurt because of the extensive market it has built up abroad, especially in Europe. Hence, it became necessary for the

leading motion picture companies to curtail expenses late in the year to offset the anticipated loss in revenue from Europe.

Production and price data of a number of leading industries for 1939, with comparative 1938 figures, are presented in the following table:

trial payrolls account for 20 to 25 per cent of the total national income paid out, even a sharp rise in manufacturing and mining activity may bring only a modest expansion in the amount of national income paid out, and therefore in purchasing power in the hands of the entire popu-

Minerals. Minerals production during 1939 kept pace with the upturn in manufacturing during the final months of the year. Bituminous coal mining was stimulated by an expansion of coal piles on hand by industrial consumers, as well as by the upturn in consumption due to increased manufacturing activity. The expected increase in coal export demand due to the war in Europe did not materialize to any important degree, however, because Canada and Latin American markets continued to receive large amounts of coal from western Europe. Crude petroleum production registered a gain for the year, but this was due to an expansion of domestic requirements, rather than an enlargement of exports because of the war.

Indices of minerals production computed by the Federal Reserve Board monthly compared during 1938 and 1939 as follows:

lation. Other major component elements of the aggregate consumer income, such as farm income and interest and dividend payments, showed a much more moderate increase for the year than did industrial payrolls.

Estimates of monthly income payments in the United States for 1938 and 1939, prepared by the Department of Commerce, were as follows:

⁵ Preliminary

Distribution. As usual, the increase in retail trade for 1939 was much more moderate than the rise in industrial activity for the year. This discrepancy results from the fact that retail distribution reflects the whole national income, rather than industrial production. Since indus-

An unusual factor affecting retail trade during the important year-end holiday shopping season was the advance in the date of the Thanksgiving Day (q.v.) holiday by one week, in an effort to lengthen the pre-Christmas shopping season. The experiment completely failed to achieve the de-

sired effect, as retail sales dropped below the level of the year before in the final week in November. The fact that many States insisted upon proclaiming the final Thursday of November as Thanksgiving Day and unseasonably warm weather which prevailed largely affected retail trade at the time. During December, a marked spurt in sales occurred, and holiday trade for the nation as a whole was very nearly of record proportions.

The Federal Reserve Board's report of department store sales and inventories compared as follows with that for 1938:

INDICES OF MONTHLY DEPARTMENT STORE SALES AND STOCKS

[1923-25 = 100, adjusted for seasonal variation]

Commodity Prices. Although a sharp spurt occurred in commodity prices in September and October, following the outbreak of the European war, by the end of the year the level of wholesale commodity prices was only back to the average of the preceding six years. Following the initial war advance, in fact, a considerable setback occurred in a number of markets, and thereafter prices fluctuated irregularly without much change in the average until the end of the year. While wheat was strengthened by the drought in the West and prospects for an exceedingly small crop in 1940, and silk rose sharply because the restrictions upon cotton use caused a substantial rise in domestic consumption of this fiber within Japan, quotations turned soft in a number of other commodity markets in the closing weeks of the year.

By and large, the behavior of the markets in a year when another major war broke out in Europe and bank deposits rose to unprecedentedly high totals within this country demonstrated that there are powerful forces which tend to stabilize commodity quotations around this level. The most important of these is the ability of many industries to expand production readily to meet increased demand. A contributing factor has been the government's agricultural program, under which prices of a number of commodities are virtually stabilized through making loans to growers and through purchases of surplus supplies in the open market for relief distribution.

A significant development was the relative stability of manufactured goods prices during the final months of the year, when the wholesale price level was advancing. A number of manufacturers favor holding their selling prices stable as long as possible, even when raw materials are rising, in order to sustain sales volume. Some feared to increase prices of manufactured goods because it might lead to new wage increase demands from organized labor. In addition, the Federal government, through various official pronouncements, made clear its opposition to higher prices for manufactured goods, and the hearings before the Temporary National Economic Committee were

utilized to supplement this official pressure against higher prices. A test of price policy occurred in the steel industry, where a number of producers favored price increases while others opposed them because it was felt that wage increase demands would follow inevitably and because it was desired to avoid a conflict with the government. When it was announced that finished steel prices would be left virtually unchanged for the first quarter of 1940, it was apparent that the advocates of price stability had triumphed.

The index of wholesale prices of the Bureau of Labor Statistics fluctuated as follows during the year:

WHOLESALE PRICE MOVEMENT [1926 = 100]

| | Combined Index | | Form Products | | Foods | | Other Commodities | |
|------|----------------|-------|---------------|------|-------|------|-------------------|------|
| | 1938 | 1939 | 1938 | 1939 | 1938 | 1939 | 1938 | 1939 |
| 1929 | 95.3 | 104.9 | 99.9 | 91.6 | | | | |

| October | 77.6 | 79.4 | 66.8 | 67.1 |
| November | 77.5 | 79.2 | 67.8 | 67.3 |
| December | 77.0 | 79.1 | 67.6 | 67.6 |
| Year | 78.6 | 77.1 | 68.6 | 65.4 |

Reflecting the stable trend in wholesale prices of most manufactured goods, the retail price level was relatively stable during the year, except where particularly sharp increases in raw material prices, as in silk, forced advances. The increased stability of wage rates also helped to keep retail prices on an even keel. The movement of major groups of retail prices during 1939, compared with 1938, was as follows, according to the cost of living indices compiled by the National Industrial Conference Board:

INDICES OF RETAIL PRICES [1923 = 100]

| Mon. | Food | | Clothing | | Fuel and Light | | Total Cost of Living | |
|-------|------|------|----------|------|----------------|------|----------------------|------|
| | 1938 | 1939 | 1938 | 1939 | 1938 | 1939 | 1938 | 1939 |

Industrial Earnings. Several favorable factors brought a sharp increase in industrial earnings for 1939. The most important of these was the greatly increased sales volume due to the acceleration of business activity and the accumu-

lation of inventories in the final months of the year. A second factor was the additional gain in productive efficiency registered in many lines, and the stability of wage rates. The firmer trend of commodity prices prevented inventory losses for the year, while price increases in raw material industries added to profits reported. As is usually the case, the widest increases in profits were shown by enterprises in industries where overhead costs are relatively large, so that a greater volume of sales does not bring a corresponding increase in expenses. Prominent among such industries were the railroads, iron and steel manufacturing and some branches of the mining industry. Many oil companies showed moderately smaller earnings because of keener competition in the sale of refined products, with consequent price-cutting, particularly during the first half of the year.

Failures and Reorganizations. Business failures were fewer in number during 1939, as is usual during a period of improving business. The facts that the price trend was rising also and that many marginal enterprises had been weeded out during the 1938 recession contributed to the decline in the number of failures. The monthly record as reported by Dun & Bradstreet was as follows:

COMMERCIAL AND INDUSTRIAL FAILURES IN
THE UNITED STATES*

| Month | 1938 | | 1939 | |
|----------------|--------|---------------------------------------|--------|---------------------------------------|
| | Number | Liabilities (thous. of dollars) | Number | Liabilities (thous. of dollars) |

| Total for year | 12,836 | 246,505 | 11,408 | 168,204 |

* Dun's Review.

In the field of corporate reorganization, the outstanding development of the year was the endorsement by the United States Supreme Court of the doctrine of "absolute priority" as the principle that should underlie reorganization plans. In the Los Angeles Lumber Company case, the U.S. Supreme Court held that senior claims against a debtor corporation should be covered fully with bonds or stock of the reorganized company before recognition is given to junior claims or capital stock. This decision is expected to expedite the reorganization of the many railroads now in process of financial readjustment, but actually progress on pending cases was quite slow during the year, and the Interstate Commerce Commission promulgated very few final plans under Section 77 of the Bankruptcy Act. Congress accorded relief to the Baltimore & Ohio and Lehigh Valley Railroads by enacting Chapter 15 of the Bankruptcy Act, which provides for a modification of indebtedness for railroads but limits the use of this simplified procedure to a brief period ending July 31, 1940. Progress was quite slow also on pending simplifications and integrations of public utility holding companies under the Public Utility Holding Act of 1935, owing to the failure of the

Securities and Exchange Commission to lay down principles to guide such readjustments.

World Business Trends. Business activity throughout the world was largely affected during the year by the intensive preparations for war which marked the first eight months and the hostilities which began in Europe at the beginning of September. With world armament expenditures running at an estimated rate of some \$20,000,000,000 annually, the demand for materials and supplies that enter into the production of war materials was stimulated even before the war began. At the same time an increasing measure of government control over business was found necessary in most countries, especially those which subsequently became involved in the war.

After the war started, several new influences made themselves apparent in world economic developments. In the first place, government regimentation of economic activity was further extended, in the belligerent countries to help win the war and in neutral countries to cushion their economies against the effects of the conflict. The destruction of shipping made it necessary for European nations generally to limit their imports of non-essentials, while Great Britain and France embarked upon a policy of increasing their imports from neutral European nations in order to reduce the supply of goods available for sale to Germany. At the same time, Great Britain and France sought to concentrate their overseas purchases within their own empires as far as possible, so as to conserve foreign exchange for future needs. The economic blockade of Germany largely cut that country off from the rest of the world. To facilitate these ends, Great Britain and France agreed upon a program of the closest economic and financial collaboration, which was hailed as a step toward an eventual European federation of nations.

Particular efforts were made in Great Britain and France to avoid an inflationary price rise because of heavy government purchases to finance the war, through rationing commodities and discouraging consumption as far as possible. It was recognized that an increase in the volume of goods absorbed by the government would have to be offset by a reduction in ordinary consumption, to avoid a competitive bidding up of prices of commodities. A large measure of success attended these efforts initially, although questions arose as to whether this program could be carried out equally successfully in the event of a protracted and far more destructive war.

The speed and relative efficacy of the economic control measures that were adopted both in belligerent and neutral countries during 1939 compared quite favorably with those that were put into effect in the earlier stages of the World War, which were frequently ill-advised and were often put into force long after the need for them first became apparent.

A review of the agricultural situation is to be found under AGRICULTURE and of labor under LABOR CONDITIONS. JULES I. BOGEN.

BUTLER, PIERCE. An American jurist, Associate Justice of the Supreme Court of the United States, died in Washington, Nov. 16, 1939. Born in Dakota Co., Minn., Mar. 17, 1866, he was educated at Carleton College (B.S., 1887) and in the following year was admitted to the Minnesota bar. His first political office was as an assistant county attorney in 1891, and two years later he was elected county attorney of Ramsey County, Minn. He held this post until 1897. From 1899 to 1905 he was general attorney for the Chicago, St. Paul, Minneapolis, and Omaha Railway. Thereafter he entered private practice but continued his association with railroad law.

He became known as one of the country's ablest railroad lawyers and was counsel for the Southern Pacific Railway (1905), one of counsel for the shareholders in the arbitration at Toronto under the Canadian Northern Railway acquisition act (1917-18), counsel for the Dominion in the arbitration at Montreal under the Grand Trunk Railway System Acquisition Act, and counsel in the Toronto Railway arbitration (1922). During 1913-18 he served as a member of the committee of counsel on the President's Conference Committee for Federal Valuation of Railroads. In addition to his work in connection with railroads, Mr. Butler was counsel for the United States in the celebrated bleached flour case and in prosecuting meat companies under the Sherman anti-trust laws (1910).

On Nov. 23, 1922, Mr. Butler was nominated by President Harding for the Supreme Court. His appointment was confirmed by the Senate, Dec. 21, 1922 and on Jan. 2, 1923 he took his seat in the court. One of Mr. Butler's better-known written decisions was in the Teapot Dome Case (1927). A staunch defender of conservative legislation, he came into conflict with the Roosevelt Administration over its emergency and reform legislation, voting against the constitutionality of all such legislation, from the original gold devaluation case to the refunding of the Agricultural Adjustment Act taxes. With the rest of the Court he helped to invalidate the National Recovery Act, but subsequently when the Court became more liberal in its interpretations, Justice Butler remained with the conservative bloc.

Up to June, 1937, he had cast 17 votes against the Administration and 10 in its favor. In the next term he dissented 20 times, and in the term of 1939 he dissented 32 times. He wrote the majority opinion when he found for the court that compulsory military training in land-grant colleges was constitutional (1934); the decision refusing citizenship to Rozsika Schwimmer, a Hungarian pacifist; the majority opinion holding the N. Y. State Minimum Wage Law for Women, holding it at variance with the Constitution, and also wrote the majority opinion refusing to grant a rehearing, which decision caused a storm of protest. He dissented in the cases of the Washington State Minimum Wage Law for Women, the Tennessee Valley Authority; the Jones & Laughlin, Fruehauf and Friedman; the unemployment features of the Social Security programme; the Scottsboro Negroes, and was in the minority when the National Labor Relations Act was upheld on appeal.

True to his own beliefs as to the proper administration of the law, Justice Butler brought to the court his wide legal experience in the field of railroad law, although he was careful not to

take part in any decisions connected with railroads with which he had once been associated. He served as a member of the Board of Regents of the University of Minnesota during 1907-24 and in 1929 was appointed a member of the advisory committee of the Harvard University Institute of Comparative Law.

BYELO RUSSIAN SOVIET SOCIALIST REPUBLIC. Same as **WHITE RUSSIAN SOVIET SOCIALIST REPUBLIC.**

CABOT, RICHARD CLARKE. An American physician and educator, died in Cambridge, Mass., May 8, 1939. Born in Brookline, Mass., May 21, 1868 he was educated at Harvard University (A.B., 1889; M.D., 1892). Dr. Cabot was associated with the Massachusetts General Hospital from 1894, founding in 1905 a social service department there, and serving as chief of the medical staff during 1912-21; and with Harvard Medical School as assistant (1899-1903), instructor in medicine (1903-08), assistant professor (1908-19), and professor of clinical medicine (1919-33), retiring as emeritus in 1934. He gave the Josiah Royce course in logic at Harvard University (1903-04) and was professor of social ethics there from 1920 to 1934.

During the World War, Dr. Cabot saw service with the U.S. Army in France and while in Paris in 1918 delivered a series of lectures at the Sorbonne which were later published under the title *Essais de Medicine Social*. A fellow of the American Academy of Arts and Sciences, he was president of the National Conference of Social Work in 1931 and in that year received the gold medal of the National Institute of Social Sciences.

One of the foremost medical men in the country, he served as a consultant at many hospitals, contributed a column to the *Boston Herald*, and published a number of books, one of the best known being *What Men Live By* (1914). Other of his works were: *Clinical Examination of the Blood* (1896; 5th ed., 1904); *Physical Diagnosis* (1901; 10th ed., 1930); *Social Service and the Art of Healing* (1909; 2d ed., 1928); *Differential Diagnosis* (vol. i, 1911, 4th ed., 1919; vol. ii, 1915, 3d ed., 1924); *Layman's Handbook of Medicine* (1916; rev., 1937); *Facts on the Heart* (1926); *Adventures on the Borderland of Ethics* (1926); *The Meaning of Right and Wrong* (1933), and *Christianity and Sex* (1937).

CADMIUM. Obtained as a by-product of zinc smelting, production of this metal varies with the output of zinc. And since its primary use in recent years has been for bearings in high-speed internal combustion engines, the fortunes of the industry are closely linked to those of automobile manufacture. This factor, among others, made 1938 the worst year in the history of the cadmium business. In marked contrast to the preceding three years consumption fell off abruptly and prices declined.

United States production in 1939 is estimated by the Bureau of Mines at 4,100,000 lb. (4,184,000 lb. in 1938) with sales about 4,800,000 lb. (3,748,000). Principal cadmium compounds produced in 1939 were cadmium sulphide, cadmium oxide, and cadmium lithopone. Consumption of cadmium in these compounds is estimated at 670,000 lb.

The average price of the metal in 1938, according to *Engineering & Mining Journal*, was 98¢ per lb., compared with \$1.22 in 1937. Decline in prices continued through 1939 until mid-year, when they rose again, closing the year at 75¢ per lb. These are producers' prices to industrial users.

Platers' prices for patented shapes were slightly higher, although the spread between the two has been narrowing.

Principal countries producing cadmium are, in order of importance: United States, Belgium, Germany, Canada, and Australia. Production in 1939 was ample for all needs at current prices.

H. C. PARMELEE.

CALIFORNIA. Area and Population. Area, 158,297 square miles; included (1930) water, 2645 square miles. Population: Apr. 1, 1930 (census), 5,677,251; July 1, 1937 (Federal estimate), 6,154,000; 1920 (census), 3,426,861. Sacramento, the capital, had (1930) 93,750; Los Angeles, 1,238,048; San Francisco, 634,394; Oakland, 284,063.

Agriculture. California harvested, in 1939, 5,378,000 acres of the principal crops. By groups, the fruit crops brought approximately a third of the return upon culture of the soil, the truck crops came next, then the annual grains and seeds, followed by hay, the ground crops, and cotton. Among leading specific crops, oranges amounted to 38,860,000 (indicated) boxes (estimated farm value, \$39,765,000); lemons, 10,650,000 boxes (\$18,638,000); grapes, 2,173,000 tons (\$29,793,000); pears, 10,334,000 bushels (\$6,101,000); peaches, 23,711,000 bu. (\$11,690,000); tame hay, on 1,484,000 acres, 4,184,000 tons (\$37,238,000); barley, 1,234,000 acres, 30,850,000 bu. (\$12,638,000); dry beans, 329,000 acres, 3,990,000 100-lb. bags (\$14,816,000); wheat, 586,000 acres, 10,548,000 bu. (\$8,122,000); rice, 120,000 acres, 9,000,000 bu. (\$6,120,000); cotton, 327,000 acres, 450,000 bales (\$20,475,000); potatoes, 74,000 acres, 22,644,000 bu. (\$13,134,000); sugar beets, 166,000 acres, 2,628,000 tons (for previous year, 1938, value of crop was estimated as \$10,352,000).

Manufacturing. Manufacturing establishments in California numbered 10,861 in 1937 (in 1935, 10,345) and employed 302,189 wage-earners (in 1935, 239,101); they paid \$389,132,068 in wages (in 1935, \$265,645,033) and produced goods to the value of \$2,899,865,426 (in 1935, \$2,141,989,850), to which they contributed by manufacture \$1,091,596,748 (in 1935, \$808,129,891). Canned and otherwise prepared fruits and vegetables, pickles, etc., were produced to the value of \$219,438,652; products of the refining of petroleum attained \$356,097,585; products of lumber approximated \$100,000,000. The production of moving pictures in the Los Angeles area employed 16,398 wage-earners and attained a value of \$171,943,349. Other manufactures in the same area employed 128,555 wage earners and produced in goods \$1,205,280,842. The area including San Francisco and Oakland employed 88,414 wage-earners and produced goods to the value of \$1,052,353,275.

Mineral Production. The rise in California's production of petroleum, in the face of persistent demand in some quarters for effectual restriction, led to the Legislature's passing in June, 1939, a measure for the compulsory proration of the products of petroleum in the State, efforts to restore the old system of voluntary proration having failed to give satisfaction. For 1938, the fifth full year of rising production, the total yield of petroleum rose to 249,749,000 barrels, from 238,521,000 for 1937. The gain occurred essentially in the Wilmington field of the Los Angeles Basin district, a field that had begun its recorded production in 1937 with 14,186,000 barrels and that jumped to 34,168,000 barrels for 1938, becoming the State's highest producer. The value of the

State's output of 1937 was about \$242,100,000. It furnished more than half of the total value of the State's native mineral production for that year, which attained \$476,974,925.

Natural gas, second in importance among the State's mineral products, was estimated to have attained for 1938 a total output of 365 billion cu. ft., as against 357 billion for 1937. The quantity of the yearly output exceeded by only a moderate proportion the estimated consumption. This consumption, reported as 329,769 million cu. ft. for 1937, was estimated as less by 4 per cent for 1938. The value of the consumed natural gas of 1937 totaled \$21,699,000 at the wells and \$91,089,000 at the end of its journey to the consumer. More natural gas was extracted from the ground than was actually produced; for some was brought up, stripped of its absorbed gasoline, and piped back under ground. Inclusive of the gas thus returned to the earth, about 388 billion cu. ft. of natural gas were treated for the extraction of natural-gas gasoline in 1938. The yearly production of such gasoline increased to 663,992,000 gallons for 1938, from 623,894,000 (value, \$37,719,000) for 1937.

The production of gold, silver, copper, lead, and zinc in California aggregated \$51,904,786, approximately, for 1939; for 1938, \$47,767,894. Within three millions of either total was contributed by gold. The output of gold rose to some 1,406,100 ounces for 1939, from 1,311,129 for 1938; in value, to \$49,213,500, from \$45,889,515. The yield of silver increased to 2,612,000 ounces (1939), from 2,590,804 (1938); by value, to \$1,772,994, from \$1,674,863. Neither copper, lead, nor zinc was produced to the value of a million dollars in either year. The production of gold, on the other hand, exceeded that in any other State of the Union for 1939 and exceeded that of California itself, as to quantity, for any other year after 1862.

Legislation. The regular biennial session of the Legislature convened in January. It quickly passed a deficiency appropriation of \$19,975,000 to cover the cost of the State's share of poor-aid through the rest of the fiscal year ending with June 30. Later in the session a defection from the Democratic majority in the Assembly (lower house) enabled Governor Olson's opponents to cut from his budget an appropriation of \$72,600,000 to carry this service through the next fiscal year; thus the question of the amount of the State's contribution was made a matter for separate appropriation after discussion between the Governor and leading legislators. The parties' slowness in making the necessary compromise helped to produce the most protracted legislative session (175 days) in the State's annals. Finally (June 22) the Legislature granted \$35,000,000 in the guise of a temporary appropriation, to bridge the time until an acceptable scheme for this line of expenditure could be shaped. Adjournment followed, on the night of the 22nd.

Following the example of a number of other States, California enacted statutes terminating the right to recover damages for breach of promise to marry and for alienation of affection. Governor Olson vetoed a bill to exclude aliens from poor-aid.

Following the State's prolonged test of the system of so-called voluntary proration of the output of petroleum, the Legislature enacted a system of State control over the production of petroleum and its marketing.

Political and Other Events. The inaugura-

tion of Governor Culbert L. Olson at the beginning of January gave the State a Democratic administration favorable to the course of President Roosevelt and in some other matters particularly committed to measures favored by liberals. Olson had implied, though he had not promised, while running for Governor in 1938, that if elected he would pardon Thomas L. Mooney, labor leader imprisoned for life in San Quentin prison after having been found guilty of perpetrating the fatal bombing of the Preparedness Parade in San Francisco in 1916. Olson's first important official act as Governor was the pardoning (see also below) of Mooney, January 7; later, after delay in obtaining the required approval of the State Supreme Court, he granted (October 16) a commutation of sentence releasing Warren K. Billings, a second-offender, serving a life sentence on conviction of participation in the same crime. Olson failed to obtain from the Legislature the funds that he sought for the support of the State's indigents (see *Legislation*, above). Early in September Olson put into effect a plan to create co-operative associations, for which the indigents were to work and from which they were to purchase goods that they needed, in the manner that had been proposed in 1934, in Upton Sinclair's scheme of "production for use."

The outgoing Governor, Frank F. Merriam, was subjected in January to examination before the grand jury of Alameda County, to determine whether he had had any connection with or knowledge of alleged activity in procuring clemency for convicts, on the part of his former secretary Mark L. Megladdery, whom Merriam had appointed a Superior Court judge before leaving office. The incoming Attorney-General, Earl Warren, took an active part in the proceedings; much testimony was obtained and made public, in accordance with the Californian practise of open proceedings before grand juries investigating public officials; testimony printed in the press included allegation that money had been paid for Megladdery's efforts on behalf of a convict who had obtained parole.

Federal Activity in the State. Work on the Central Valleys Water Project progressed, the Federal Administration awarding contracts, in particular for material to be used in the construction of the Shasta Dam, notably about \$10,000,000 worth of cement, which the builders were to start using early in 1940; this dam was to provide water for irrigation and for generating electric current for an area of some millions of acres, more northerly than that served by Boulder Dam. Moves on the part of the Federal Government to establish a claim to the coastal submerged deposits of petroleum in the State continued: Acting Secretary of the Navy Edison urged Congress (February 20) to authorize the U.S. Attorney-General to remove from the territorial waters all persons taking petroleum there without the permission of the United States, and asserting that one nation (supposedly Japan) had obtained from this area, in 1937, 30,000,000 barrels of petroleum or its products; about the same time, State Attorney-General Warren filed a brief at Washington, denying the basis for a Federal claim to the petroleum off the Californian coast. As to the influx of indigents into the State, the Federal Administration had a commission make a study of ways in which to deal with it; the resulting report proposed resettling migrants where they could best support themselves, returning some of them to

their former homes, and spreading information that would stop further fruitless immigration into California.

The conflict between the Federal Government and San Francisco over the disposal made of electric current derived from works at the Hetch Hetchy dam was continued. While a Federal District Court's injunction against the city, in the Federal litigation to terminate the sale of such current through the Pacific Gas and Electric Company as "agent," was in course of appeal, the city held (May 19) a special election, at which it voted on a proposal to issue \$55,000,000 of bonds with which to meet the cost of a proposed municipal system for distributing this current. The voters rejected the bond issue, as they had rejected a like proposal earlier in the controversy, in 1937.

The Mooney Pardon. Governor Olson's grant of pardon to Thomas J. Mooney, the convicted bomber, after Mooney's having served 22 years in prison, took place in the State Capital at Sacramento, in the presence of a throng of thousands of Mooney's supporters and admirers, admitted by ticket. The occasion was so arranged as to give it the character of amends made by the State to a martyr of the cause of labor, as great numbers in the ranks of the labor unions held Mooney to be. Olson had made the issuing of the pardon the first piece of major business in his administration. He met Mooney in the crowded chamber of the State Assembly, held a "hearing," at which none came forward to oppose the pardon, expressed his belief that the prisoner was wholly innocent, and then delivered to Mooney, with his own hand, the pardon document; after which Mooney addressed the audience, and the meeting adjourned to the State Fair Grounds, where a greater assemblage had come to attend the Governor's inaugural barbecue. Mooney was paraded on the following day in San Francisco, along Market Street, where the bombing in 1916 had occurred.

The Mooney case, which had been repeatedly carried to the Federal Supreme Court and to that of the State without success, arose from the explosion of a bomb (July 22, 1916) in Market Street, San Francisco, during the march of a parade on Preparedness Day; the bomb took ten lives. Mooney and others were indicted promptly. Tried in January and February, 1917, Mooney was convicted and sentenced to hang. Judge Griffin, who had heard the case, asked the State's Attorney-General to petition the State Supreme Court for a new trial. This was done, but a new trial was denied, nor was it granted after a special commission named by President Wilson had reported (Jan. 16, 1918), in favor of retrial. Governor Stephens commuted the sentence (Nov. 28, 1918) to imprisonment for life. Efforts for a new trial were renewed after the lapse of years had weakened popular sentiment against the prisoner. He was finally reindicted and was put on trial again (May 22, 1933); the court directed the jury (May 24) to return a verdict of guilty. Prior to the bombing, Mooney had been thrice tried and at last acquitted of complicity in a plot to dynamite property of the Pacific Gas and Electric Company at Contra Costa in 1913, and in 1915 he had become an associate editor of a periodical, *The Blast*, run by Emma Goldman and Alexander Berkman. The original case against Mooney depended in great part on his identification by a waiter, John MacDonald, as one of two

men seen taking a suit case to the place of the explosion just before it occurred.

Old-Age-Pension Campaign. Defeated at the polls in November, 1938, the campaign for substantial pensions to be paid by the State to all of its citizens who were ripe for retirement from working for their own support revived early in 1939 under a somewhat altered form. The age of qualification for the receipt of the proposed pension was kept at 50 years; the rate of the payments to each recipient, at \$30 a week; and the medium of the payment was still to be the circutable State warrant extinguishable within a year by the required affixing, weekly, of a stamp costing 2 per cent of the warrant's face value. But in order to improve the plan of 1938 the sponsors now proposed the creation of a special system of credit-clearing banks to take the place of the unwilling commercial banks, in handling the warrants; the issue of \$20,000,000 of the State's bonds for the means to give the plan a start; and the removal of a requirement that public employees accept warrants for half their pay. The name California Retirement Life Payment Plan was adopted. As in the pension movements of 1938 and earlier, signatures to a petition for a referendum election were solicited and readily obtained. A petition carrying over 700,000 names was presented. Governor Olson issued (July 1) a proclamation requiring that a special election, as sought, be held on November 7. In an accompanying statement Olson declared himself personally opposed to the plan, thus making an end of reticence maintained on the subject up to that time. The plan was defeated on November 7 by about 2,000,000 adverse votes to 1,000,000 in favor. Governor Olson came out on the 12th with a propitiatory proposal that the State amplify its aid to the elderly by giving \$60 a month, to start at the individual's reaching 60 years.

Relations with Labor Unions. The question of the validity of the "closed shop" (exclusion of non-union labor by agreement between union and employer) was in course of litigation during the year. A decision of the State Appellate Court (April 7) held, in cases dealing with picketing to enforce a closed shop, that a law of 1933, forbidding contracts requiring employees to join some specific labor organization, was applicable and constitutionally sound; counsel for the A.F.L. unions involved in the case announced the intention to appeal.

The NLRB ordered the Bank of America National Trust and Savings Association to reinstate certain employees and to cease to discourage employees' membership in a C.I.O. union, and held this and similar banks amenable to the NLRB's rulings under the terms of the Labor Relations Act. In Los Angeles eleven men connected with the C.I.O. were indicted (February 16) for prosecution as having extorted union dues from employees in the local Chrysler works. In the maritime trades employers' contracts with longshoremen, masters, engineers, and some other groups were extended from their date of termination, October 1. Earlier in the year disagreements between employers and some of the C.I.O. maritime unions occasioned strikes on the San Francisco waterfront. The Associated Farmers of America, a body that had taken a course objectionable to unions in California, was slated for investigation by the U.S. Senate's Civil-Liberties Committee, which received an appropriation of \$50,000 chiefly for this task.

Collective Medical Service Started. The California Physicians' Service, a profit-renouncing corporation, was established. It had the sponsorship of the State Medical Association and was designed to provide medical care, at need, to poor people in return for flat monthly payments at the usual rate of \$2.50 a month. The care of the organization was extended in August to cover members of the California State Employees' Association, and agreements were sought with other great bodies of employees.

San Francisco's Affairs. The opening of San Francisco's World's Fair, the GOLDEN GATE INTERNATIONAL EXPOSITION (q.v.), on February 18 started a season of more than nine months of incoming tourists and visitors. An account written in August indicated that figures for travel into the city, for issues of permits to construct residential buildings, and for sales in a variety of lines were all favorably affected. The long-discussed plan to standardize the salaries of municipal employees was embodied in an ordinance, adopted by the Board of Supervisors and signed by Mayor Rossi (March 1); the process of standardization therein provided called for increasing the pay of about 4000 persons. A committee acting for taxpayers undertook to oppose the ordinance and there followed a submission of the issue to popular vote, by the route of a referendum; a special election (May 19), by an adverse vote of three to one, rejected the ordinance for standardizing pay. The city's vote against bonds for a proposed plan of municipal electrical distribution is discussed in a paragraph above, on *Federal Activity*.

Events in Los Angeles. Mayor Bowron, a former judge of the Superior Court, made Mayor by the pro-reform vote in an election in 1938 for the recall of the previous Mayor, Frank L. Shaw, was active in the course expected of him. A trial brought the conviction of Joseph E. Shaw and William Cormack, two officials of the previous administration, on charges of altering civil service records, to the advantage of certain candidates for positions. Changes were made in personnel and assignments in the police. Bowron thereafter asked the voters to defeat for re-election four members of the City Council, whom he regarded as unacceptable; two or more were reported to have lost their seats in the municipal election of May 2. Proceedings in the Superior Court were carried on in July for the purpose of ending the trade of four vessels habitually anchored at sea off Los Angeles harbor, beyond the State's jurisdiction, and reputed to be gambling establishments. The main line of the Metropolitan Water District's aqueduct from the Colorado River began operation November 19, sending 270,000 gallons a minute to the Cajalco reservoir for the use of Los Angeles and twelve other cities.

Officers. California's chief officers, serving in 1939, were: Governor, Culbert L. Olson (Dem.); Lieutenant-Governor, Ellis E. Patterson; Secretary of State, Frank C. Jordan; Treasurer, Charles G. Johnson; Comptroller, Harry B. Riley; Attorney-General, Earl Warren; Superintendent of Public Instruction, Walter F. Dexter.

CALIFORNIA, UNIVERSITY OF. A coeducational institution of higher learning with headquarters at Berkeley, Calif., founded in 1868. Campuses are found in various parts of the State. At Los Angeles, the University of California at Los Angeles, the Los Angeles Medical Depart-

ment; at Mt. Hamilton is the Lick Observatory; at San Francisco, the California School of Fine Arts, Hastings College of the Law, Medical School, the George Williams Hooper Foundation for Medical Research, College of Dentistry, College of Pharmacy; at Davis, a campus devoted chiefly to instruction and research by the College of Agriculture; at Riverside, the College of Agriculture, including the Citrus Experiment Station and Graduate School of Tropical Agriculture; at La Jolla, the Scripps Institution of Oceanography.

The total number of resident students in the academic and professional departments, fall session, 1939, was 26,004, of whom 15,655 were men and 10,349 were women. At Berkeley 16,199 were enrolled; at Los Angeles 8522. The enrollment in the University extension division, fall of 1939, was 14,577 in classes and correspondence courses. The 1939 summer session enrollment (Berkeley and Los Angeles) totaled 8153. During 1938-39 there were approximately 2067 members on the regular teaching staff and 717 on the extension staffs. The total income for 1938-39 was \$13,394,850, including gifts totaling \$648,654 for current use. In addition, gifts were received totaling \$219,938 for plant, \$851,237 for endowment, and \$29,315 for loan funds. Total assets were listed at \$87,785,742 including \$53,812,732 in real estate, improvements, and equipment, and \$24,201,748 in endowment and trust funds. The libraries contained approximately 1,597,304 volumes. President, Robert Gordon Sproul, LL.D.

CALIFORNIA INSTITUTE OF TECHNOLOGY. An institution for collegiate and graduate instruction and research in the pure and applied sciences in Pasadena, Calif., founded as Throop University in 1891. The enrollment for 1939-40 was 886, of whom 615 were in the undergraduate and 271 in the graduate school. The faculty numbered about 200. The endowment was approximately \$12,000,000 and the annual income approximately \$1,000,000. There were 48,675 volumes in the library. Construction was completed on four new buildings. The institute has no president, the administration centering in an executive council of nine, of which Robert A. Millikan, Ph.D., LL.D., Sc.D., is chairman.

CALINESCU, ARMAND. Rumanian Prime Minister, assassinated in Bucharest, Sept. 21, 1939 by members of the pro-Nazi Iron Guards. He was born in Pitesti, Rumania, May 22, 1893 and was educated at Bucharest University and in Paris. A lawyer by profession, he became a leader of the National Peasant Party in his native county of Arges, and his first public office was as secretary general of the Ministry of Agriculture and Domains. Subsequently he became under-secretary of the Interior. In December, 1937, at the request of King Carol, he accepted the post of Minister of the Interior in the cabinet of Octavian Goga, although he did not subscribe to his policies. In the cabinet of Miron Cristea (q.v.) he retained this post and was directed by the King to suppress the Iron Guards who, during the Goga regime, had flourished unmolested. He arrested many of the leaders and made public a series of crimes committed by the organization, included in which was a plan to kill King Carol. Upon the death of Cristea he was appointed Premier (Mar. 7, 1939), having served as Vice Premier. He retained the posts of National Defense and Interior.

Because of his opposition to the Iron Guards he had exercised great care. But on September 21,

on his way to a conference with the King, his car was intercepted and he was shot through the head and killed instantly. His executors were captured and shot in the public square. A firm champion of Rumanian independence, Calinescu was a known foe of Fascism. For a history of his brief premiership, see *RUMANIA under History*.

CAMBODIA. See FRENCH INDO-CHINA.

CAMERAS. See PHOTOGRAPHY.

CAMEROON, kām'ēr-ōon', FRENCH. A West African territory, part of the former German protectorate of Kamerun, confirmed as a mandate of France by the League of Nations in 1922. Area, 162,934 square miles; population (Jan. 1, 1938 estimate), 2,516,623, compared with (1936 census) 2,389,000. Yaoundé (capital), 20,000 inhabitants in 1936.

Production and Trade. The main products (1937-38 production, in metric tons) consist of groundnuts, 40,000; maize, 36,000; palm oil (1938 export), 8900; palm-kernel oil (1938 export), 14,900; cacao (1938 export), 31,000. Gold (440 kilograms estimated production for 1938), almonds, hides, timber, and ivory were other products. Livestock in 1938 included 900,000 oxen and 25,000 asses. Communications (1938): 3105 miles of roads suitable for motor-vehicle traffic, and 314 route miles of railway. In 1938 (values in old U.S.A. gold dollars), imports were valued at \$5,300,000 and exports at \$5,400,000. During 1937, 721 vessels aggregating 1,604,803 tons entered and cleared the ports.

Government. Budget (1938): revenue, 107,762,000 francs; ordinary expenditure, 98,392,000 francs; extraordinary expenditure, 9,370,000 francs (franc averaged \$0.0288 for 1938). French Cameroon was constituted an autonomous territory, both administratively and financially, by decrees of Mar. 23, 1921 and Feb. 21, 1925. Commissioner, M. Boisson.

CAMEROONS, kām'ēr-ōonz', BRITISH. That part of the former German protectorate of Kamerun which was confirmed as a mandate of Great Britain by the League of Nations in 1922. Area, 34,081 square miles; population (1938 estimate), 831,103, compared with (1931 census) 770,000. Palm oil, palm kernels, cacao, bananas, and rubber are the main products. In 1937, imports were valued at £337,694 and exports at £526,984. Vessels aggregating 537,452 tons entered and cleared the ports of Victoria and Tiko. For 1936-37, revenue was £125,075 and expenditure was £173,092. Administration is under the control of the governor of Nigeria. The northern part of the territory is attached to the Nigerian provinces of Adamawa, Benue, and Bornu; the southern part, known as Cameroons province, it attached to the Southern Provinces of Nigeria.

CAMP FIRE GIRLS, Inc. An organization providing constructive leisure-time activities for 250,000 girls between the ages of 10 and 20, and through the Blue Birds, the junior organization, for girls 8 to 10.

In 1939, the Camp Fire Girls' interest in Americana led them to an exploration of their heritage of art, music, literature, scientific achievements, and folklore. Americana exhibits and costume parties were held throughout the country in which whole families, and often whole communities took part. Older Camp Fire Girls made valuable contributions to the World Center for Women's Archives by gathering information and important documents on "Women of Achievement" in their towns. Every group of Camp Fire Girls has some

camping experience each year, and last year the attendance at the 128 organized Camp Fire Camps was greater than ever before. National Headquarters are at 88 Lexington Avenue, New York City.

CANADA. A Dominion of the British Commonwealth of Nations, comprising nine provinces and two territories. (See separate articles on the provinces and territories.) Capital, Ottawa.

Area and Population. The land area, the census population of June 1, 1931, and the estimated population on June 1, 1939, are shown by provinces and territories in the accompanying table.

AREA AND POPULATION OF CANADA

| Provinces and Territories | Land area, sq. miles | Population 1931 | 1939 |
|-------------------------------|----------------------|-----------------|------------|
| Prince Edward Island . . . | 2,184 | 88,038 | 95,000 |
| Nova Scotia | 20,743 | 512,846 | 554,000 |
| New Brunswick | 27,473 | 408,219 | 451,000 |
| Quebec | 523,534 | 2,874,255 | 3,210,000 |
| Ontario | 363,282 | 3,431,683 | 3,752,000 |
| Manitoba | 219,723 | 700,139 | 727,000 |
| Saskatchewan | 237,975 | 921,785 | 949,000 |
| Alberta | 248,800 | 731,605 | 789,000 |
| British Columbia | 359,279 | 694,263 | 774,000 |
| Yukon Territory | 205,346 | 4,230 | 4,000 |
| Northwest Territories | 1,258,217 | 9,723 | 10,000 |
| Total | 3,466,556 | 10,376,786 | 11,315,000 |

The Indian population in 1931 was 122,920. Of the white population in 1931, 5,381,071 were of British origin (English, 2,741,419; Scottish, 1,346,350; Irish, 1,230,808; other, 62,494) and 2,927,990 of French origin. There were 5,374,541 males and 5,002,245 females.

In 1931, 4,804,728 inhabitants resided in rural districts and 5,572,058 in urban communities. Populations of the chief cities in 1931 were: Montreal, 818,577 (1,263,298, with suburbs, in 1938); Toronto, 631,207 (648,309 in 1938); Vancouver, 246,593; Winnipeg, 218,785 (215,814 in 1936); Hamilton, 155,547; Quebec, 130,594; Ottawa, 126,872; Calgary, 83,761 (83,407 in 1936); Edmonton, 79,197 (85,774 in 1936); London, 71,148; Windsor, 63,108; Verdun, 60,745 (64,144 in 1939); Halifax, 59,275; Regina, 53,209 (53,354 in 1936); Saint John, 47,514; Saskatoon, 43,291 (41,734 in 1936). Including suburbs, Montreal had 1,000,157 inhabitants in 1931 (1,443,588 in 1938); Toronto, 808,864 (855,235 in 1938); Vancouver, 308,340; Winnipeg, 280,202.

The total number of immigrants entering Canada in 1938 was 17,244, of whom 4659 were Canadians returning from the United States; 3389 were from the United Kingdom. Living births in 1937 numbered 220,235 (19.8 per 1000); deaths, 113,824 (10.2 per 1000); marriages, 87,800 (7.9 per 1000). The 1937 birth rate by provinces ranged from a high of 24.1 for Quebec to a low of 15.0 for British Columbia. The average birth rate of all Canada for the period 1926-30 was 24.1 per 1000.

Education and Religion. Illiteracy rate, 1931 census, 7.2 per cent of all over five years. Out of a total estimated population of 11,120,000 in 1937, there were 2,460,074 enrolled in educational institutions (2,222,565 in provincially-controlled schools, 110,946 in privately-controlled schools, 18,297 in Dominion Indian schools, and 98,366 in universities and colleges).

The principal religious groups in Canada at the 1931 census were: Roman Catholics, including 186,654 Greek Catholics, 4,285,388; United Church (Methodists, Congregationalists, and Presbyterians), 2,017,375; Anglicans, 1,635,615; Presbyterians (not included in United Church), 870,728; Baptists, 443,341; Lutherans, 394,194; Jewish,

155,614. Of the 2,927,990 Canadians of French origin at the 1931 census, 2,849,096 were Roman Catholics.

Production. An unofficial estimate published in the *Financial Post Business Yearbook and Market Survey* placed Canada's national income in 1938 at \$4,401,500,000, or 8.1 per cent less than in 1937. According to estimates of the Dominion Bureau of Statistics, the gross value of production in 1937 was \$5,658,877,000 (\$4,862,126,000 in 1936); and the net value, \$2,970,617,000 (\$2,628,419,000). Of the 1937 net production, manufactures accounted for \$1,193,399,000; agriculture, \$678,953,000; mining, \$372,796,000; forestry, \$284,504,000. Ontario led the provinces, with 44.44 per cent of the net production. Quebec ranked second with 25.56 per cent.

Agriculture. The estimated gross value of agricultural production in 1938 was \$1,020,217,000. The value of the gross output in 1938 by chief items was (in provisional figures): Field crops, \$528,860,000; livestock and poultry, \$585,213,000; dairying, \$220,163,000; fruits and vegetables, \$42,952,000. Yields of the principal field crops in 1936, 1937, and 1938, with preliminary returns for 1939, are shown in the accompanying table.

CANADIAN CROP YIELDS, 1936-39

(Units in thousands of bushels, except as indicated)

| | 1936 | 1937 | 1938* | 1939 ^b |
|--------------------------|---------------------|---------------------|---------------------|---------------------|
| Wheat | 219,218 | 182,410 | 350,010 | 449,058 |
| Oats | 271,778 | 268,442 | 371,382 | 373,132 |
| Barley | 71,922 | 83,124 | 102,242 | 99,209 |
| Rye | 4,281 | 5,771 | 10,988 | 16,549 |
| Buckwheat | 8,596 | 7,745 | 7,079 | ... |
| Mixed grains | 33,639 | 36,129 | 39,161 | ... |

* Subject to revision. ^b Estimates ^c 1,000 cwt. ^d 1,000 tons

The gross value of the principal field crops produced in 1939 was estimated at \$635,764,000, divided in part as follows: Wheat, \$251,371,000; hay and clover, \$111,697,000; oats, \$105,764,000; potatoes, \$38,059,000; barley, \$33,266,000; mixed grains, \$18,976,000; alfalfa, \$17,720,000; fodder corn, \$13,577,000. Livestock on Canadian farms in June, 1939, included 8,474,000 cattle, 4,294,000 swine, 3,365,800 sheep, and 2,824,390 horses. The 1939 wool clip was estimated at 13,615,000 lb.

Manufacturing. Statistics for 1937 were: Number of employees, 660,451; capital, \$3,465,227,831; salaries and wages, \$721,727,037; values of materials used, \$2,006,926,787; gross value of production, \$3,623,159,500; net value of production, \$1,506,624,867. In 1932 the gross value of production was \$1,980,472,000. The following figures for gross value of production for 1937, with 1932 figures in parentheses, show the industrial groups recording the most striking gains: Iron and its products, \$622,520,000 (\$232,697,000); non-ferrous metals, \$482,441,000 (\$152,111,000); wood and paper, \$597,062,000 (\$368,789,000); vegetable products, \$672,540,000 (\$447,804,000); chemicals, \$148,973,000 (\$95,279,000); non-metallic minerals, \$208,205,000 (\$136,698,000); textiles, \$400,384,000 (\$257,109,000); animal products, \$449,784,000 (\$262,794,000).

Output of central electric stations in 1938 was 26,012,000,000 kilowatt hours (preliminary) while the total capacity of these stations was 7,486,900 h.p. (4,925,500 in 1929). Production of wood pulp for the same year was 3,667,800 tons; paper and paper products, 3,249,300 tons (newsprint, 2,668,900 tons). Canada in 1938 produced 70.7 per cent

of all North American newsprint and 34.9 per cent of the world output.

Mineral Production. Minerals accounted for 30.7 per cent of all Canada's exports in 1938. In that year the value of all mineral production was \$444,824,222 (provisional), as against \$457,359,092 in 1937 and \$230,434,726 in 1931. The Dominion holds first rank in world production of platinum metals, asbestos, and nickel, second in radium, third in gold, copper, and zinc, and fourth in lead. The quantity and value of the leading mineral products in 1938 were: Gold, 4,715,480 fine oz., \$165,867,009; copper, 586,020,402 lb., \$58,026,972; nickel, 210,673,270 lb., \$53,949,311; coal, 14,247,783 short tons, \$43,912,204; lead, 418,913,257 lb., \$14,008,459; asbestos, 289,877 short tons, \$12,893,806; zinc, 381,506,588 lb., \$11,723,697; natural gas, 33,441,139 M. cu. ft., \$11,847,803; petroleum, crude, 6,956,229 bbl., \$11,826,594; silver, 22,157,154 fine oz., \$9,633,265; cement, 5,519,102 bbl., \$8,241,350.

The value of mineral production in 1939 reached an all-time high of \$470,179,000, according to preliminary returns. Gold accounted for \$104,305,000 (about \$182,000,000 including the premium); silver, \$76,969,000; copper, \$60,721,000; nickel, \$51,099,000; coal, \$48,098,000; asbestos, \$15,454,000; natural gas, \$12,250,000; lead, \$12,375,000; zinc, \$12,066,000; crude petroleum, \$10,409,000; platinum, \$9,368,000.

Forest Products. Forestry statistics for 1937 were: Primary production, \$163,249,887; lumber production, 4,005,601 M. ft. b.m., \$82,776,822; sawmill products, \$104,849,785; pulp and paper products, \$226,255,915; exports of wood, wood products and paper, \$223,918,476 (\$253,434,860 in 1938). Sawmill statistics for 1937 were: Number of mills, 3836; capital, \$90,405,000; employees, 33,917; payroll, \$27,173,000.

Fisheries. The value of production of sea and inland fisheries in 1938 was \$40,552,000, the highest since 1930. Sea fisheries accounted for \$33,827,000 or 83 per cent; inland fisheries, \$6,725,000, or 17 per cent. Fish exports in 1938 were valued at \$25,590,000. The principal kinds of fish caught, and the value as marketed, were: Salmon, \$15,045,000; lobster, \$3,335,000; herring, \$2,487,000; halibut, \$1,789,000; whitefish, \$1,655,000; sardines, \$1,393,000; haddock, \$1,362,000; trout, \$1,038,000; pickerel, \$1,032,000. Capital employed in the industry in 1938 was \$48,561,000; number of employees, 85,871.

Fur Production. Fur farms in 1937 accounted for 40 per cent of all pelts produced in Canada. Pelts of all kinds taken in 1937 numbered 6,237,640, valued at \$17,526,365. There were 9179 fur farms, with a capital of \$17,363,000, of which \$9,676,000 was invested in fur-bearing animals. The total number of animals on farms was 241,359; the number of live animals sold, 25,202; pelts sold, 259,870; total fur farm revenue, \$6,810,000. Out of total pelt sales of \$5,779,400 from fur farms in 1937, silver fox pelts provided \$5,019,400.

Tourist Trade. Total expenditures of foreign travelers in Canada during 1938 were officially estimated at \$273,431,000 (\$290,581,000 in 1937). Of the 1938 total, overseas travelers accounted for \$14,693,000 and the remainder was spent by travelers from the United States. Canadian travelers in foreign countries spent \$123,913,000 in 1938 (\$124,422,000 in 1937), of which \$103,956,000 (\$102,087,000) was spent in the United States.

Foreign Trade. Canadian foreign trade in recent fiscal years is shown in the accompanying table.

CANADIAN IMPORTS AND EXPORTS

(In thousands of Canadian dollars)

| Years ended March 31 | Total exports | Total imports | Excess: Imports (-) Exports (+) |
|-------------------------|------------------|------------------|---------------------------------------|
| 1929-30..... | 1,144,938 | 1,248,274 | -103,336 |
| 1932-33..... | 534,978 | 406,384 | +128,594 |
| 1936-37..... | 1,074,244 | 671,876 | +402,369 |
| 1937-38..... | 1,084,821 | 799,070 | +285,751 |
| 1938-39*..... | 969,770 | 658,228 | +311,542 |

* Preliminary figures.

Of the 1938-39 imports, the United States supplied \$412,477,000; United Kingdom, \$115,636,000; Straits Settlements, \$10,564,000; Germany, \$10,117,000; Australia, \$8,807,000; British India, \$8,356,000. Of the exports, the United States took \$375,939,000; United Kingdom, \$325,465,000; Australia, \$33,254,000; Japan, \$21,045,000; Germany, \$17,796,000; New Zealand, \$17,028,000; Union of South Africa, \$15,913,000. Values of leading imports were: Crude petroleum, \$41,483,348; coal, \$35,937,195; machinery, except farm, \$35,286,756; automobile parts, \$23,455,938; farm implements and machinery, \$18,079,948. The chief exports were: Newsprint, \$107,360,211; gold bullion (non-monetary), \$87,590,120; wheat, \$84,494,433; nickel, \$49,565,526; copper bars, \$42,190,363; planks and boards, \$37,100,824; meats, \$35,375,618.

Finance. The accompanying table shows the total Dominion budget receipts, ordinary expenditures, and total expenditures for the period 1936-37 to 1939-40.

DOMINION FINANCES
(Thousands of Canadian dollars)

| Years ended March 31 | Total revenues | Ordinary expendi- tures | Total expendi- tures | Surplus (+) or deficit (-) |
|-------------------------|-------------------|-------------------------------|----------------------------|----------------------------------|
| 1916-37..... | \$454,154 | \$387,112 | \$532,005 | -\$ 77,851 |
| 1937-38..... | 516,693 | 414,891 | 534,408 | - 17,715 |
| 1938-39..... | 502,171 | 413,032 | 553,063 | - 50,892 |
| 1939-40*..... | 490,000 | | 550,000 | - 60,000 |

* Estimates, excluding about \$30,000,000 for defense, to be handled on amortization basis, and losses on 1938 wheat crop in excess of \$25,000,000.

The funded debt of the Federal Government and Treasury Bills outstanding on Mar. 31, 1939, aggregated \$3,385,697,034 (\$3,314,532,604 on Mar. 31, 1938); total liabilities, \$3,710,610,593 (\$3,608,191,471).

Shipping. During the fiscal year ended Mar. 31, 1938, a total of 26,407 sea-going vessels of 31,421,775 register tons entered Canadian ports with 12,698,849 tons of cargo. Vessels cleared, 27,359 of 31,402,043 register tons, with 13,882,060 tons of cargo. Tonnage arriving at the leading ports in 1938-39 was: Vancouver, 10,979,372; Montreal, 8,796,218; Victoria, 7,120,232; Quebec, 4,118,635; Halifax, 3,889,933; Toronto, 3,259,243. Canadian canals in 1938 carried approximately 24,640,501 tons of freight and 50,140 passengers. Traffic through the combined American and Canadian locks of Sault Ste. Marie was 68,900,000 tons in 1939 (39,700,000 in 1938).

Railways, etc. On Jan. 1, 1938, the mileage of steam railways in Canada was 42,727. The two main systems were the privately-owned Canadian Pacific Railway, with 17,186 miles of single track, and the government-owned Canadian National Railways, with 21,974 miles. In the calendar year 1937 all steam railways carried 22,038,709 passengers and 82,220,374 tons of freight, with total earnings of \$42,991,444 and total expenditures of \$29,545,641. Gross revenues of the two main systems in 1938 were \$299,800,000 against \$310,300,-

000 in 1937; carloadings, 2,428,500 (2,635,382). Carloadings in 1939 numbered 2,548,944.

The total highway mileage in 1937 was 559,040 (see **ROADS AND STREETS**). Motor vehicles registered as of Jan. 1, 1939, numbered 1,375,133. In August, 1939, scheduled air services were maintained by 11 operating air lines over 16,112 miles of route (eliminating duplications). Statistics of commercial air lines operating entirely within Canada for 1938 were: Miles flown, 8,350,463; paying passengers carried, 87,482; freight carried, 19,368,865 lb.; mail carried, 1,305,174 lb. Regular air-mail service on the new trans-Canada route between Montreal and Vancouver was started Mar. 1, 1939, and passenger service on April 1.

Government. Governor-General in 1939, Baron Tweedsmuir of Elsfeld (John Buchan), who assumed office Nov. 2, 1935. Prime Minister, President of the Privy Council, and Secretary of State for External Affairs, William Lyon Mackenzie King (Liberal), appointed Oct. 23, 1935. For the members of the cabinet at the beginning of 1939 and the Constitution, see 1938 **YEAR BOOK**, p. 124. For changes in the cabinet and other governmental developments in 1939, see *History*.

HISTORY

Canada Enters War. The historic controversy over Canada's course in the event of Britain's involvement in a European war was resolved as a result of the British declaration of war upon Germany on Sept. 3, 1939. Before the European crisis reached its climax, the Cabinet on August 24 unanimously agreed that if Britain went to war Canada would join her. During the ensuing week, the government took precautionary military and economic measures while Prime Minister Mackenzie King, alone among the chief executives of the British Dominions, followed President Roosevelt's example and addressed peace appeals to Hitler, Mussolini and President Moscicki of Poland.

With the German invasion of Poland on September 1, Canada was placed on a war footing and Parliament was called in special session. In accordance with the Cabinet's previous decision, Canada automatically entered the conflict at the same moment as Great Britain on September 3. On September 9 Parliament sustained the Cabinet's policy by an almost unanimous vote. The next day the government issued a formal declaration of war. As evidence that this represented an independent act of the Canadian nation, the proclamation was issued in the name of Minister of Justice Ernest Lapointe over the printed signature of Prime Minister Mackenzie King and under the seal of the Governor-General, who acted in the name of the King. In 1914 the Canadian Government entered the World War merely by publishing the British war declaration in the official *Canada Gazette*.

Neutrality Debate. The government's policy in case Britain went to war had been debated at length in the parliamentary session that opened Jan. 12, 1939. Isolationist and nationalist spokesmen demanded that the rapidly mounting defense expenditures be spent exclusively on preparations to resist attacks upon Canada. The issue was raised in another form by an isolationist motion providing that Canada should not become a belligerent in a British war unless the Canadian Government directly advised the Crown to that effect. A French-Canadian member proposed that Canada be declared an independent kingdom to safeguard its neutrality. Another demanded that Parliament

should not commit the country to another war without a General Election on the issue.

The debate continued intermittently from January to April, with numerous participants. It was climaxed by the statements of Dr. Robert Manion, Roman Catholic leader of the Conservative Opposition; Prime Minister Mackenzie King; and Minister of Justice Lapointe, spokesman of French-Canadian Liberal opinion. All three opposed neutrality legislation on the ground that it was impossible for Canada to remain neutral in a British war and stay in the British Commonwealth. They expressed equal opposition to conscription for any overseas war. The Prime Minister further asserted that his government's policy was the same as that set forth in 1910 by Sir Wilfred Laurier, the French-Canadian Liberal leader, as follows:

If England is at war, we are at war, and liable to attack. I do not say we will always be attacked, neither do I say we should take part in all the wars of England. That is a matter that must be guided by circumstances, upon which the Canadian Parliament will have to pronounce and have to decide in its own best judgment.

The Royal Visit. Isolationists' sentiment in Canada derived much of its strength from general disillusionment with British foreign policy toward the League of Nations and in Ethiopia, Spain, and Czecho-Slovakia. But there was a strong revival of opinion favorable to co-operation with London as a result of various developments in 1939. In the first place the Chamberlain Government beginning in March abandoned its policy of appeasement in favor of firm resistance to aggression. Even more influential was the visit of King George VI and Queen Elizabeth to Canada and the United States. They landed at Quebec on May 17, journeyed by rail to the Pacific Coast, stopping at Ottawa and most of the larger cities en route, entered the United States at Niagara Falls for a four-day visit on June 7, and then returned to Canada for a trip through the Maritime Provinces before sailing for England from Halifax on June 15. In both French- and English-speaking provinces the people displayed unqualified enthusiasm for the royal couple and firm allegiance to the British connection.

Other Anglo-Canadian Ties. Canada's political ties with Great Britain were reinforced by the development of mutual economic interests. The British Government in June gave a substantial stimulus to Canadian industry by placing an additional order for \$13,000,000 worth of machine guns and other armaments. This was stated to be the first installment of a long-time program costing \$250,000,000 by which London sought to develop Canada as a secondary source of supply for the British defense forces. The growing Canadian wheat surplus was another effective argument in favor of loyalty to Britain; without Empire markets wheat growers of the Prairie Provinces faced almost certain ruin.

Moreover there was growing anxiety over the success achieved by Nazi emissaries in organizing Canadians of German origin as adjuncts of the National Socialist Reich and its aggressive policies. Of some 140,000 persons of German stock resident in Saskatchewan in 1939, it was estimated that 30,000 were avowed Nazis and it was charged that many of them had signed formal pledges of allegiance to the German *Fuehrer*. The German-born population of Canada exceeded 50,000. On May 14 the anti-Hitlerite German-Canadian League voted to ask the government to investigate Nazi activities in the Dominion and to enlist Canada in

the "stop Hitler" bloc being organized in Europe by Great Britain and France. On May 30 the House of Commons passed a Secrets Act curbing espionage and foreign propaganda in Canada. The Nazi-Soviet rapprochement of August and September strengthened Canadian support of the Anglo-French coalition, particularly in Catholic Quebec.

The Quebec Election. It was among the French-speaking population that the supreme test of loyalty to the British connection occurred. The English-speaking provinces accepted willingly the emergency war powers assumed by the Federal Government, including control of foreign exchange, trade and provincial borrowing. However Premier Maurice Duplessis of Quebec denounced these measures as an infringement on provincial autonomy. On September 25 he dissolved the Quebec Legislature and called for a popular vote of confidence in his stand "for the survival of the French-Canadian race. . . ." He declared that a vote for his party was "a vote for autonomy . . . against conscription . . . participation and assimilation."

Duplessis had been swept into power in 1936 on a strong wave of French-Canadian nationalism which overwhelmed the long-dominant Liberal party (see 1938 YEAR BOOK, p. 634). His challenge was accepted by French-Canadian Liberals as well as by the Dominion Government and English-speaking Canadians generally as a threat to the war unity of the Dominion. Gilbert Layton, Minister without Portfolio in the Duplessis Cabinet, resigned in protest at his chief's policy. The Liberal party organization in Quebec headed by Adélard Godbout denounced the election call as a move to cover up the Premier's three-year "maladministration." The three French-Canadian members of the Federal Cabinet, led by Ernest Lapointe, announced that they would resign if Duplessis won. A third party, Paul Gouin's National Action movement, also attacked the Duplessis Government, but on the ground that it was not sufficiently nationalist.

French-Canadian opposition to conscription for overseas military service was the crux of the ensuing election battle. The three French-Canadian parties, like the Federal Government under Mackenzie King, all pledged themselves to oppose conscription. But Quebec voters apparently feared that a Duplessis victory would not only estrange their province from English-speaking Canada but lead to a Federal election and the formation of a National Government at Ottawa that would not be bound by Prime Minister Mackenzie King's anti-conscription promise.

The result was an overwhelming defeat for Premier Duplessis in the voting on October 25. The Liberals won 68 of the 86 seats in the Quebec Legislative Assembly, in which Duplessis had previously controlled 71 seats. Gouin's National Action candidates garnered very few votes. Godbout formed a new provincial government which thereafter worked in close co-operation with the Ottawa Government.

Canada's War Contribution. Even before war began in Europe, Canada's role had been largely determined in conferences between British and Canadian officials. In the World War Canada mobilized nearly 600,000 men and sent 400,000 across the Atlantic. In 1939 preparations were made for the creation of only two overseas divisions of about 20,000 men each. The first of these, under the command of Major Gen. A. G. L.

McNaughton, was landed in Great Britain on December 17.

Canada made its major contribution as a source of economic and military supply for Britain and its armies, and as a training ground for a huge Empire air force in process of creation as the year ended. The machinery for protecting Canadian economic resources and making them available to the British cause was set in motion even before the war broke out. On August 25 the militia was called out to man coastal defenses, guard canals and other communications lines, maintain an anti-submarine air and naval patrol, etc. On August 28 the Defense Department assumed control of all merchant ships of Canadian registry. When war came, this control was extended to virtually all forms of transportation and industry needed for the mobilization of economic resources. An Order-in-Council of September 3 set up the War Time Prices and Trade Board to control domestic prices in the necessities of life. The police began a round-up of known Nazis and an Air-Raid Precautions Committee was established. The War Measures Act giving the government wide emergency powers was proclaimed September 4. Government censorship of the press and radio broadcasting was put into effect.

The extraordinary session of Parliament on September 8-13 increased the government's war powers. A wartime budget boosting taxes so as to conduct the war on a pay-as-you-go basis was adopted. Corporate and individual income taxes were increased. An excess-profits tax was levied on earnings of all business enterprises. On September 15 the government assumed control over imports, exports and all foreign exchange transactions. Wheat and other grain supplies were reserved for the use of Britain and her allies. The first war loan, a short-term issue of \$200,000,000 two-year notes bearing interest at 2 per cent, was sold at par to the chartered banks on October 12. The properties of enemy aliens were liquidated. All of these efforts were reflected in the steady flow of grain, munitions and other supplies from Canada to Britain that continued under convoy during the remainder of the year. Canadian naval forces co-operated increasingly with those of Britain in the convoy work.

Air Training Scheme. In 1938 the Canadian and British Governments reached an agreement for the training of Royal Air Force recruits in Canada (see 1938 YEAR BOOK, p. 126). The estimated cost of this programme was about \$6,000,000. With the outbreak of war, this scheme was scrapped in favor of a much more ambitious plan. The British Air Minister announced on October 10 that an agreement had been reached with Canada, Australia, and New Zealand for the creation of a great Empire air force, with Canada serving as the advanced training ground for pilots from the three Dominions.

The accord putting this agreement into effect was signed in Ottawa, December 17 by representatives of the four participating countries. The scheme called for the establishment of a large number of aviation training schools, expected to turn out about 5000 pilots and technicians the first year, 10,000 the second, and 20,000 the third. A total personnel of 39,000, entirely Canadian, was to maintain the schools. Britain was to supply most of the aircraft, but other planes and equipment were to be made in Canada and included in the general cost of the program, which was to be divided between Canada, Australia, and New Zea-

land in proportion to the number of pupils trained. Total cost of the program to its expiration on Mar. 31, 1943, was estimated at \$600,000,000 and Canada's share was estimated at \$350,000,000.

Canada thus prepared to make its major contribution to the prosecution of the war through reinforcing British air power. It was announced on December 1 that the Royal Canadian Air Force would maintain its separate identity in the European fighting, instead of being incorporated in the Royal Air Force as during the World War. Many Canadian airmen had previously enlisted in the Royal Air Force. In December, 1939, the first Royal Canadian Air Force squadron was ready to be sent overseas. At the beginning of December the Canadian air strength consisted of 1500 officers and 15,000 men.

There was also some slight expansion of the Canadian Navy. The fleet of 6 destroyers and 4 mine-sweepers was increased in October by addition of the flotilla leader *Assiniboine* and the requisitioning of 40 commercial vessels for naval service. The government also ordered 38 new anti-submarine and aircraft salvage vessels. See MILITARY PROGRESS.

Dominion Politics. Canada's entrance into war changed the political situation in the Dominion as well as in the Province of Quebec. In anticipation of an early General Election, the political parties were maneuvering for position when the year opened (see 1938 YEAR BOOK, p. 125). Because of the persistence of unemployment and the decline of wheat prices, the fortunes of the Liberal Government appeared to be ebbing. It suffered another severe blow to its prestige as a result of many criticisms directed at the Mackenzie King Government, and particularly the Ministry of Defense under Ian Mackenzie, for the manner in which a contract for 7000 Bren machine guns had been awarded to a Maj. J. E. Hahn of Toronto. These criticisms led to the subsequent passage of a bill creating the Defense Purchasing Board during the spring session of Parliament.

Several new political groups made their appearance in opposition to both the Liberal and Conservative parties. William Herridge, former Minister to Washington, launched the New Democracy party calling for social and economic reforms similar to those of the New Deal in the United States. He formed a united front with the Social Credit party of Alberta and received the unsolicited support of the Communist party. A reactionary movement led by George McCullagh and favoring "big business" interests made its appearance in Ontario. However the war and the overthrow of the Duplessis Government in Quebec restored a large measure of unity within the Liberal ranks. Mitchell Hepburn, Liberal Premier of Ontario, made a political truce with Prime Minister Mackenzie King. The latter announced that the General Election would be postponed until 1940. He indicated that he had no intention of following the precedent set during the World War and forming a National Government.

Toward the end of the year the Conservative party leader opened a vigorous attack upon the government, charging that its war efforts were insufficient and that political patronage had determined war contracts and appointments. On the other hand Communist and pacifist groups attacked the government for its participation in the conflict. On November 21 the Minister of Justice forbade publication and distribution of several

Communist newspapers under the defense of Canada regulations.

A substantial improvement in economic conditions after the outbreak of war strengthened the government's position, but the accumulation of a huge unsold export surplus of some 415,000,000 bushels of wheat in November threatened to have political repercussions. Negotiations were opened to induce Great Britain to purchase this surplus, instead of filling its grain requirements with cheaper wheat from Argentina and other sources. On December 4 it was announced that the British Government had agreed to buy all the bacon and ham Canada could produce during the war.

Cabinet Changes. Mackenzie King sought to strengthen his government by several cabinet changes during the year. On January 23 Norman Alexander McLarty was appointed Postmaster General in place of John Campbell Elliott and James Angus MacKinnon was named Minister without Portfolio. On September 19, in response to criticisms of Defense Minister Ian Mackenzie, the latter was transferred to the Department of Pensions and National Health, and was succeeded by Norman Rogers, former Minister of Labor. Rogers was succeeded as Minister of Labor by former Postmaster General McLarty.

Legislation, etc. The major legislative development of the year, outside of war measures, was the passage during the regular parliamentary session ending June 3 of a series of laws for the assistance of agriculture and other primary producers. Of outstanding interest was the law reducing the government wheat-price guarantee from 80 cents per bu.—paid in 1938—to 70 cents for No. 1 Northern wheat in storage at Fort William. Provision was made for the issuance of participation certificates, enabling growers to share in any surplus resulting from operations of the Wheat Board. (The government incurred a direct deficit of about \$25,000,000 in 1938 through its wheat-price guarantee scheme.)

Other legislation provided for co-operative marketing of agricultural products with a Federal guarantee on the initial payment; granted reduced bonuses to farmers with low wheat yields; extended Federal assistance to producers of high-quality cheese and to the improvement of cheese-factory facilities; established bonuses for producer-fishermen; improved salt fish export marketing facilities; and created a central mortgage bank as an adjunct to the Bank of Canada for the purpose of readjusting debts on farm and certain urban properties and providing cheap mortgage loans.

Provincial-Dominion Relations. New jurisdictional controversies between the Federal and provincial governments cropped up during the year, giving further impetus to the agitation for constitutional reform (see 1938 YEAR BOOK, p. 124). A dispute arose between the Federal and Quebec governments over which was responsible for provision of relief to Eskimos in the Ungava district of Quebec. The Supreme Court ruled that the Federal Government must do so. The Federal Government refused its assent to a projected barter deal between the Manitoba Government and German interests involving wheat and other farm produce. Nevertheless Premier Bracken of Manitoba went ahead with negotiations for the deal until the European war crisis intervened. The Quebec Government concluded an agreement with Italy for the exchange of dried codfish for Italian wines.

Canadian-American Relations. Canada's relations with the United States assumed exceptional importance following its entrance into the European war because of President Franklin D. Roosevelt's statement at Kingston, Ont., in August, 1938, that "the people of the United States will not stand idly by if domination of Canadian soil is threatened by any other Empire." In his review of Canadian foreign affairs before the House of Commons at Ottawa on Mar. 30, 1939, the Prime Minister declared that because of Roosevelt's statement "August, 1938, is as important in North American annals as September (the Munich Conference) was in the annals of Europe."

When the European war began, Canada was exempted from the United States neutrality regulations until after she had formally declared war upon Germany. On September 12 provisions of the United States arms embargo were made applicable to Canada also. The major effect of the embargo was to cut off Canadian purchases of United States airplanes, which were badly needed for the development of the Canadian and Empire air forces. The removal of the embargo in November gave Canada a great advantage over other belligerents in the purchase of war implements and munitions, particularly airplanes.

On September 12 President Roosevelt stated at Washington that Canada's declaration of war had not altered the force of his Kingston pledge. But Col. Charles A. Lindbergh, in his radio address of October 12, presented another facet of Canadian-United States relations that was far from appealing to Canadian opinion. With the exception of a few Duplessis supporters in Quebec, Canadians displayed unanimous resentment at Lindbergh's suggestion that Canada should sever its relationship with Great Britain to eliminate the danger that the United States might be drawn into war through an attack upon Canada by an enemy of Great Britain. The Ottawa correspondent of the *New York Times* summed up the Canadian reaction as follows:

A cross-section of editorial and epistolary opinion would seem to be that the colonel's speech was a tactless and pro-Nazi gesture which, if endorsed by his countrymen would be a disturbing revelation of American imperialism likely to do grave harm to Canadian-American relations, but that it was not so endorsed and should not be taken too seriously.

St. Lawrence Seaway Project. One result of the overthrow of the Duplessis Government in Quebec was the removal of the chief obstacle to the reopening of negotiations between Ottawa and Washington on the St. Lawrence seaway project. Several weeks before the Quebec election, Premier Hepburn of Ontario, the other outstanding opponent of the project, conditionally withdrew his objections. On October 27 President Roosevelt announced that the three United States members of the International (Canadian-American) Joint Commission would be replaced by three government officials in preparation for the resumption of negotiations on the St. Lawrence project. United States exports to Canada were benefited by the removal in the Dominion's 1939-40 budget bill of the 3-per cent special excise tax on all imports except those from a few countries whose goods were subject to the general tariff. A supplementary Canadian-American reciprocal trade agreement was signed Dec. 30, 1939.

Relations with British Dominions. The drastic import control measures introduced during the year by New Zealand (q.v.) adversely affected

Canadian exports to that Dominion, which amounted to more than \$16,000,000 in 1938. The Ottawa Government announced June 27 that it would appoint High Commissioners to South Africa and Ireland immediately and to Australia and New Zealand in the near future. A South African High Commissioner had arrived at Ottawa some months before and an Irish High Commissioner arrived in August. The appointments to Australia, New Zealand and Ireland were announced late in December. For other Empire relations, see GREAT BRITAIN and the several Dominions under *History*.

CANADA, THE UNITED CHURCH OF. The designation applied to the single body formed by the union in 1925 of the Congregational, Methodist, and Presbyterian churches in Canada; the Methodist churches of Newfoundland and Bermuda are also included. Foreign mission work is carried on in Japan, Korea, China, India, Trinidad, and Angola (West Central Africa). In 1938 there were in Canada, Newfoundland, and Bermuda 7423 preaching places (including home missions) in 2829 pastoral charges, 707,264 communicant members, and 1,742,622 persons under pastoral care. A total amount of \$11,671,147 was raised for all purposes. At the Eighth General Council held in Toronto, Ont., in September, 1938, the Rev. John W. Woodside, M.A., D.D., was chosen moderator for the ensuing biennium. Rev. Gordon A. Sisco, M.A., D.D., is general secretary. Headquarters: 421 Wesley Building, Toronto, Ont.

CANALS. Outside the usual activities of the U.S. Army Engineers in connection with inter-coastal waterways, the year has been rather quiet in the field of canal construction. The Florida ship canal project, abandoned a year or more ago, has shown fitful signs of revival, but on May 17 the Senate refused to approve further expenditures, and in view of the apparent determination of the present Congress to curtail expenditures it seems doubtful if this much discussed and partly completed project will be revived.

Reports from Germany indicate that the inter-connecting canals in that country, described in previous YEAR BOOKS, have been an important means of transportation for supplies from Russia and the East. Russia has also been actively engaged in canal work but details are not available. Traffic through the principal canals of the Great Lakes-St. Lawrence waterways in 1939, with 1938 figures in parentheses, were as follows (in tons): Sault Ste. Marie Canals (Canadian and United States locks), 69,850,206 (40,043,629); Welland Ship Canal, 11,727,703 (12,629,054); St. Lawrence Canals, 8,340,165 (9,236,318).

See PANAMA CANAL; BELGIUM under *History*.
JAMES K. FINCH.

CANARY ISLANDS. An archipelago off the coast of Rio de Oro in northwest Africa. Administratively they form two provinces of Spain: (1) Las Palmas (comprising the islands of Gran Canaria, Lanzarote, Fuerteventura, and the islets of Alegranza, Roque del Este, Roque del Oeste, Graciosa, Montaña Clara, and Lobos), area, 1279 square miles; population (1935), 270,033; capital, Las Palmas (83,553 inhabitants) on Gran Canaria. (2) Santa Cruz de Tenerife (comprising the islands of Tenerife, Palma, Gomera, and Hierro), area, 1528 square miles; population (1935), 329,679; capital, Santa Cruz de Tenerife (66,429 inhabitants). Roads had a total length of 653 miles in 1938.

CANCER. See BIOLOGICAL CHEMISTRY; MEDICINE AND SURGERY.

CANTON ISLAND. A coral atoll (2° 49' S. and 171° 43' W.) in the Phoenix group of the central Pacific, midway between Hawaii and New Zealand. It is 29 miles in circumference and has a land mass of from 50 to 600 yards wide which encloses a lagoon of 9 miles in diameter. During 1937 and 1938 the islands of Canton and Enderbury, over which both the United States and Great Britain claimed sovereignty, assumed great importance because of their value as bases for trans-Pacific air services. The two countries in the Anglo-U.S.A. Pact of Aug. 10, 1938, agreed to set up a regime assuring equality of facilities to their respective nations in the field of international aviation and communications, and agreed to leave the question of title in abeyance.

On Apr. 6, 1939, after an exchange of notes between the two countries, it was announced that the formula for the control of the two islands would apply for 50 years and thereafter indefinitely unless terminated or modified. Each government would be represented by an administrative official and the islands would be available for use by civil aviation companies incorporated in the United States or the British Commonwealth of Nations. The agreement states that the arrangement is made by the two countries "without prejudice to their respective claims." On Apr. 13, 1939, the United States granted a license to Pan American Airways allowing them to erect the necessary facilities, and included provisions in the license which would permit the use of the base by a British air transport company upon payment of a reasonable amount to Pan American Airways. A ship containing the necessary structural supplies for the erection of a commercial air base left the port of San Francisco, Calif., for Canton Island on Apr. 29, 1939.

CAPE OF GOOD HOPE. See SOUTH AFRICA, UNION OF.

CAPE VERDE (vûrd) ISLANDS. A dependency of Portugal, 320 miles west of Cape Verde, French West Africa. The islands comprise the Barlevento (windward) group (São Vicente, Santo Antão, São Nicolau, Santa Luzia, Sal, Boa-vista, Branco, and Raso) and the Sotavento (leeward) group (Santiago, Maio, Fogo, Brava, Rei, and Rombo). Total area, 1557 square miles; population (Jan. 1, 1938 est.), 165,000 including 6318 Europeans. Capital, Praia (on Santiago), 6188 inhabitants. The chief products are sisal, castor oil, mustard, coffee, oranges, maize, tobacco, salt, brandy, and hides. In 1938, imports were valued at 107,090,000 escudos (U.S. \$4,744,000) including fuel oil (61,626,000 escudos) and coal (13,798,000 escudos); exports, 117,754 escudos (U.S. \$5,217,000). The escudo averaged \$0.0443 for 1938. The larger part of the exports consisted of the supply of fuel oil, coal, and water to ships. Colored cotton cloth, foodstuffs, iron and steel tubes, and wire were the main imports for local use. The budget for 1939 was 19,452,001 escudos (17,661,748 escudos for 1938). Governor, Maj. A. G. de Figueiredo.

CARDINALS. See ROMAN CATHOLIC CHURCH.

CARIES. See DENTISTRY.

CARLETON COLLEGE. A coeducational

college of liberal arts in Northfield, Minn., founded in 1866. The enrollment for the autumn of 1939 was 862. There were 86 faculty members. The endowment amounted to \$3,598,345, and the total income for the year was \$575,418. The library contained 125,461 volumes and 31,974 pamphlets. President, Donald John Cowling, Ph.D., D.D.

CARNEGIE CORPORATION OF NEW YORK. Established by Andrew Carnegie in 1911, this corporation was formed for the advancement and diffusion of knowledge and understanding among the people of the United States and the British Dominions and Colonies. Its total endowment is approximately \$135,000,000, of which \$10,000,000 is applicable in the British Dominions and Colonies. The annual report of the president, Frederick P. Keppel, showed that during the fiscal year 1938-39 the sum of \$4,846,126 was appropriated.

The trustees of the corporation as of Dec. 1, 1939, were: Thomas S. Arbutnot, Vannevar Bush, Nicholas Murray Butler, Samuel Harden Church, Henry James, Walter A. Jessup, Nicholas Kelley, Frederick P. Keppel, Russell Leffingwell, Margaret Carnegie Miller, Frederick Osborn, Arthur W. Page, and Elihu Root, Jr. Officers of administration were: Frederick P. Keppel, president; Robert M. Lester, secretary; and Robertson D. Ward, treasurer. Office: 522 Fifth Avenue, New York City. See ART MUSEUMS.

CARNEGIE FOUNDATION FOR THE ADVANCEMENT OF TEACHING, THE. A foundation established in 1905 by Andrew Carnegie, who placed an endowment of \$10,000,000 in trust for the purpose of encouraging higher education in the United States, Canada, and Newfoundland. Following its incorporation by Congress in 1906, its resources were increased by a further gift of \$5,000,000 from Mr. Carnegie in 1908 and by appropriations of \$1,250,000 in 1913 and \$12,000,000 in 1918 from the Carnegie Corporation of New York. On June 30, 1939, its endowments and accumulated reserves amounted to \$26,917,932.

The foundation publishes extensive annual reports, which deal with many phases of the educational process. In 1939 it was engaged upon various studies concerning higher education in the United States, professional education, the relations between secondary and higher education in Pennsylvania, and graduate instruction. Dr. Walter A. Jessup is president, and Howard J. Savage, secretary and treasurer. Headquarters are at 522 Fifth Avenue, New York City.

CARNEGIE INSTITUTE OF TECHNOLOGY. A nonsectarian institution for technical education at Schenley Park, Pittsburgh, Pa., founded in 1900. The enrollment for the autumn of 1939 was 5309, including 2389 registered in the regular day courses and 2920 in the evening courses. For the summer session 566 students were enrolled. The faculty numbered 350. The endowment amounted to \$17,464,419, and the annual income was \$1,494,826 (not including student fees). The institute is adjacent to the Carnegie Library of Pittsburgh, which has 450,600 volumes. President, Robert Ernest Doherty, B.S., M.S., M.A., LL.D.

CARNEGIE INSTITUTION OF WASHINGTON. An organization founded in 1902 by Andrew Carnegie "to encourage in the broadest and most liberal manner investigation, research, and discovery, and the application of knowledge to the improvement of mankind." The Institution at-

tempts to advance fundamental research in fields not normally covered by the activities of other agencies, and to concentrate its attention upon specific problems, with the idea of shifting attack from time to time to meet the more pressing needs of research as they develop with increase of knowledge.

Income on investments for the year 1939 amounted approximately to \$1,500,000, and was required almost entirely for support and maintenance of major projects undertaken by the Institution, mostly in the physical and biological sciences. The application of physical methods in study of biological problems has been given special impetus during the past year. Results of its work were made known through technical and scientific journals, its yearbook, and a series of scientific monographs and news releases. To date the Institution has issued over 700 monographic publications.

W. Cameron Forbes is Chairman of the Board of Trustees of the Institution, and Vannavar Bush is President. Other Trustees are: Thomas Barbour, James F. Bell, Robert Woods Bliss, Frederic A. Delano, Homer L. Ferguson, Walter S. Gifford, Herbert Hoover, Walter A. Jessup, Frank B. Jewett, Charles A. Lindbergh, Alfred L. Loomis, Roswell Miller, Henry S. Morgan, Stewart Paton, John J. Pershing, Elihu Root, Jr., Henry R. Shapley, William Benson Storey, Richard P. Strong, Charles P. Taft, James W. Wadsworth, Frederic C. Walcott, and Lewis H. Weed. Headquarters: Sixteenth and P Streets, N.W., Washington, D. C.

CAROLINE ISLANDS. See JAPANESE PACIFIC ISLANDS.

CARPATHO-UKRAINE. See CZECHO-SLOVAKIA.

CARTER, HOWARD. A British Egyptologist, died in London, Mar. 2, 1939. He was born at Swaffham in Norfolk in 1873 and, due to ill health, was educated privately. Attracted toward archaeology he studied under the leading men of his day, and in 1890 made his first trip to Egypt as a member of the Egyptian Exploration Fund Archaeological Survey. He was assistant to Prof. Flinders Petrie in his excavations at Tel-el Amarna for Lord Amherst in 1892, and in the following year again joined the E.E.F.A.S. in its Deir-el Bahari Campaign. From 1900 to 1905 he was inspector general of the Antiquities Department of the Egyptian Government, which he reorganized, and discovered for the Government the royal tomb of Mentuhotep.

From 1907 to 1923, Mr. Carter carried on exploration work in the Valley of the Kings, and for Theo M. Davis discovered the tomb of Hatshepsut, Thothmes IV; and with the Earl of Carnarvon made extensive explorations of the Theban Necropolis and discovered the Valley-temple of Hatshepsut, the tomb of Amenhotep I, the cemetery of the 18th Dynasty Queens, the cliff-tomb of Queen Hatshepsut, all of which was crowned by the discovery in 1923 of the 3000-year-old sepulchre of Tutankhamen. Thereafter, he supervised the examination of the last-named and the removal of its contents to the Cairo Museum.

Mr. Carter's writings included *The Tomb of Thothmes IV* (1904), *The Tomb of Hatshepsut* (1906), *Five Years' Explorations at Thebes* (1912), and, with A. C. Mace, *The Tomb of Tut-ankh-Amen* (1923).

CASE SCHOOL OF APPLIED SCIENCE. An engineering college in Cleveland,

Ohio, founded in 1880. In the autumn of 1939 the enrollment was 1643. The 1939 summer session registration was 230. The faculty numbered 131. The endowment amounted to \$4,135,658. The library contained 34,543 volumes. President William Elgin Wickenden, D.Eng., D.Sc., LL.D.

CASTELROSSO ISLAND. See ÆGEAN ISLANDS, ITALIAN.

CASUALTY INSURANCE. See INSURANCE.

CATALONIA. A region in northeastern Spain, consisting of the provinces of Barcelona, Gerona, Lérida, and Tarragona. Chief city, Barcelona. See SPAIN under *History*.

CATHOLICS. See RELIGIOUS ORGANIZATIONS, ROMAN CATHOLIC CHURCH.

CATHOLIC UNIVERSITY OF AMERICA, THE. A national pontifical institution of higher education, located in Washington, D. C., and founded in 1887 by the Roman Catholic hierarchy of the United States with the approval of the Holy See. The enrollment for the autumn of 1939 was 2060, of which 532 were in the Graduate School, 70 in Canon Law, 87 in Law, 367 in Arts and Sciences, 250 in Engineering and Architecture, 152 in the School of Philosophy, 56 in Social Work, 130 in the School of Nursing, 244 in the School of Sacred Theology, and 172 in the School of Social Science, and 77 in the National Catholic School of Social Service. The summer school enrollment for 1938 was 1868. The faculties number 275 teachers, with 43 additions in 1939. In the library there are 350,000 volumes. Chancellor, the Most Reverend Michael J. Curley, S.T.D., Archbishop of Baltimore; Rector, Rt. Rev. Monsignor Joseph M. Corrigan, S.T.D.

CATHOLIC WELFARE CONFERENCE, NATIONAL. The official agency of the Archbishops and Bishops of the American Hierarchy for the promotion of unity in Catholic work locally and nationally, organized in 1919. The "N.C.W.C.," as it is now popularly known, succeeded the emergency National Catholic War Council, one of the seven agencies recognized by the United States Government for welfare work during the World War.

The Conference is administered by a Board of Archbishops and Bishops elected at the annual meetings of the Hierarchy held in the Nation's Capital each year. The present personnel of the Board, as elected November, 1939, was:

Most Rev. Samuel A. Stritch, chairman of the Administrative Board; Most Rev. John B. Peterson, vice chairman; Most Rev. John A. Duffy, secretary; Most Rev. Francis C. Kelley, treasurer; Most Rev. John Gregory Murray, Department of Catholic Action Study; Most Rev. Hugh C. Boyle, Legal Department; Most Rev. Joseph F. Rummel, Department of Lay Organizations; Most Rev. Edwin V. O'Hara, Social Action Department; Most Rev. Mark Gammon, Press Department. The active executive officer of the Board is the Rt. Rev. Monsignor Michael J. Ready. Rev. Dr. J. Carroll is Assistant General Secretary.

The National Catholic Welfare Conference operates through the following Departments and Bureaus:

EXECUTIVE—Bureaus maintained: *Immigration, Youth, National Center Fraternity of Christian Doctrine, Information, National Catholic Youth Council, Publications, Business and Auditing, and CATHOLIC ACTION, official organ, N.C.W.C.*

EDUCATION—Divisions: *Statistics and Information, Teachers' Registration, Library.*

PRESS—Serves the Catholic press in the United States

and abroad with regular news, features, editorial and pictorial services.

SOCIAL ACTION—Covers the fields of Industrial Relations, International Affairs, Civic Education, Social Welfare, Family Life and Rural Life.

LEGAL—Serves as a clearing house of information on Federal, State, and local legislation.

LAY ORGANIZATIONS—Includes the National Council of Catholic Men and the National Council of Catholic Women, which maintain at N.C.W.C. headquarters permanent representations in the interests of the Catholic laity. These councils function through some 4500 affiliated societies—national, State, diocesan, district, local, and parish; also through units of the councils in many of the dioceses.

CATHOLIC ACTION STUDY—Devoted to research and reports as to pronouncements, methods, programs, and achievements in the work of Catholic Action at home and abroad.

The N.C.C.M. maintains at its national headquarters a Catholic Evidence Bureau, sponsors a weekly nation-wide radio Catholic Hour over the network of the National Broadcasting Company, and conducts a Catholic Radio Bureau. The N.C.C.W. maintains in Washington, D. C., the National Catholic School of Social Service.

It is not the policy of the N.C.W.C. to create new organizations.

It helps, unifies, and leaves to their own fields those that already exist.

It aims to defend and to advance the welfare both of the Catholic Church and of our beloved Country.

It seeks to inform the life of America of right fundamental principles of religion and morality.

It is a central clearing house of information regarding activities of Catholic men and women. **CATHOLIC ACTION** records monthly the work of the Conference and its affiliated organizations. It presents common needs and opportunities. Its special articles are helpful to every Catholic organization and individual.

At their 1939 general meeting, the Bishops had the satisfaction of receiving from His Holiness Pope Pius XII in an Encyclical address "To the Church in the United States," a special commendation for their joint interest in and support of the Conference to which His Holiness referred as an agency which supplies "a ready and well-adapted instrument for your Episcopal ministry." Previously the Holy Father had praised "the wisdom and foresight" with which the members of the Hierarchy are "meeting the problems of these changing times."

Reviewing in their annual reports the manifold activities of the Conference, the Administrative Board was able to report to the annual general meeting of the Bishops in November that the work of the National Catholic Welfare Conference is "well organized" and that "the continuing service rendered to vital Catholic interests constitutes strong defense for the welfare of the Church in our country."

CESPEDES Y QUESADA, CARLOS MANUEL DE. A Cuban statesman, died in Havana, Mar. 28, 1939. Born in New York, Aug. 12, 1871, the son of the first president of Cuba, he was educated in the United States, France, and Germany. Returning to Cuba, during 1895-98 he served as a colonel in the Army and took part in the last revolution for independence, was a member of two revolutionary assemblies, and was governor of the province of Santiago de Cuba. He was vice-president of the House of Representatives under the Republic from 1902 to 1908, and then entered the diplomatic service as envoy extraordinary and minister plenipotentiary to Italy (1909-13), to Argentina (1913-14), and to the United States (1914-22). During this period he was a special envoy to Greece in 1912, president of the Cuban delegation to the 2d Pan American Scientific Congress (1915) and to the 2d Pan American Financial Congress (1920), and was chairman of the Cuban mission that sold Cuban sugar to the United States and the Allies in 1917-18.

In 1922, Cespedes was appointed secretary of state of Cuba, and in 1927 he went to France as minister to that country, returning in 1931. Out of the political arena for a time, in August of 1933, after the fall of the Machado regime, he was selected as provisional president. A coup d'état by the students and the army caused his displacement in September. During his short tenure, he and his cabinet worked indefatigably to restore order. In 1934 he was appointed Cuban ambassador to Spain, and on his return in August, 1935, he formed the Centrist party, but after the failure of that party in the 1936 elections, he retired from active political life.

CEYLON, sê-lôn'. A British self-governing insular colony near the southern extremity of India. Area, 25,332 square miles; population (Jan. 1, 1938 estimate), 5,780,000 compared with (1931 census) 5,312,548. During 1937 there were registered 216,072 births, 124,210 deaths, and 33,205 marriages (including 2333 Muslim marriages). Buddhism and Hinduism are the chief religions. Chief towns: Colombo (capital), 310,400 inhabitants in 1936; Jaffna, 47,700; Moratuwa, 34,900; Galle, 38,000; Kandy, 40,100. In 1937 there were 784,185 students attending the 5839 primary and secondary schools; the university college had 586 students enrolled for 1937-38.

Production and Trade. Agriculture is the most important industry in the island, the area under cultivation being about 3,500,000 acres. The chief agricultural products (with 1938 production figures, in metric tons) are tea (106,900, exported), copra (197,000), rubber (60,000), rice, coir, cinnamon, cacao, tobacco, citronella. Livestock (1937): 1,603,500 cattle, 60,500 sheep, 219,500 goats, 35,900 swine, and 1300 horses. In 1937 there were 229 plumbago mines in operation and 17,380 tons of plumbago were exported. Ilmenite and monazite exist in commercial quantities. There are numerous quarries in which small gems such as rubies, moonstones, cat's-eyes, and sapphires are obtained. Factories for making rubber goods, cigarettes, bricks, and tiles, ghee, and for canning cashew nuts have been erected. Cottage industries include the making of jewelry, baskets, tiles, pottery, coir yarn, and metal and lacquer work. In 1938, imports were valued at Rs235,529,101; domestic exports, Rs263,534,522

of which tea accounted for Rs172,420,857 (rupee averaged \$0.3733 for 1937; \$0.3659 for 1938).

Communications. In 1938 there were 17,806 miles of highways, and 951 miles of railways (including 117 miles of narrow gauge). Shipping aggregating 12,054,181 tons entered the ports during 1937. On Feb. 28, 1938, the new air service linking Colombo with the Empire air route from Southampton, England, to Karachi, India, was inaugurated.

Finance. Budget (1938-39): revenue, Rs117,426,650; expenditure, Rs128,952,900 (including Rs5,471,160 of loan-fund expenditure). The net public debt on Sept. 30, 1937 amounted to Rs134,625,200. For 1939-40 revenue was estimated at Rs116,000,000 and expenditure at Rs120,000,000.

Government. The government is administered by a governor, assisted by a state council of 61 members (50 elected on a territorial basis, 8 nominated unofficial, and 3 officers of state). This state council is divided into 7 executive committees in charge of various subjects, and the chairmen of these committees are ministers for the subject concerned. A government agent is at the head of each one of the 9 provinces into which the island is divided for administrative purposes. Governor, Sir Andrew Caldecott (assumed office, Oct. 16, 1937).

History. The British defence estimates for 1939-40 included the sum of £1,500,000 to be used for the construction of a new naval and air base at Trincomalee. The recommendations of Sir Andrew Caldecott, the governor, for the abolition of the executive committees and their replacement by a cabinet formed by the chief minister have been published in *Correspondence Relating to the Constitution of Ceylon* (H. M. Stationery Office, London; 1939).

Maldivé Archipelago. A chain of some 2000 coral islets (about 200 inhabited), 400 miles southwest of Ceylon, of which they are a dependency. Area (land), 115 square miles; population (1931), over 79,000 Moslems. Capital, Malé. The main products are coconuts, millet, dried fish, cowrie and tortoise shell, and edible nuts. The modified constitution provides for an elected Sultan, a people's assembly of 33 members (28 elected and 5 nominated), and a cabinet of 4 ministers. Sultan, Hasan Nuruiddin Iskander II (elected, Mar. 12, 1935; assumed Sword of State, July 21, 1938).

CHAMBER OF COMMERCE OF THE UNITED STATES. A national federation of trade associations and local, state, and regional commercial organizations, established in 1912 for the formulation of business opinion on national economic questions. The membership in 1940 consisted of more than 1650 chambers of commerce and trade associations.

The Chamber maintains twelve departments, covering main divisions of business activity: Agriculture; Construction; Commercial Organization; Manufacture; Domestic Distribution; Finance; Foreign Commerce; Insurance; Natural Resources Production; Trade Association; Transportation and Communication; Research. It publishes a monthly magazine, the *Nation's Business*,

and the *Washington Review*, the latter dealing with the relations of government and business.

In 1939-40 the Chamber, through its member organizations, initiated a nationwide effort to bring about a better public understanding of business operations and to center attention upon national economic policies from a local and regional viewpoint. It continued its effort to reduce federal expenditures and to promote the development of a sound fiscal system. Defects in regulatory legislation and its administration which operate to the detriment of business were brought to the attention of congressional committees and administrative agencies.

The work of the Chamber is directed by 58 officers and directors and upward of twenty standing and special committees with an aggregate membership of more than 300.

W. Gibson Carey, Jr., of New York City, is President of the Chamber. John W. O'Leary, of Chicago, is Chairman of the Executive Committee and active resident officer. Vice-Presidents are: Thomas H. McInerney, New York; Clem D. Johnston, Roanoke, Va.; James S. Kemper, Chicago; O. J. Arnold, Minneapolis; Joseph W. Evans, Houston, Texas; W. C. Mullendore, Los Angeles.

CHANDERNAGOR. See FRENCH INDIA.

CHANDLER, COL. CHARLES DE FOREST, U.S.A., RET. An American army officer and aeronaut, died in Washington, May 17, 1939. Born in Cleveland, Dec. 24, 1878, he was educated in the local schools, and in 1898 was a 1st lieutenant in the U.S. Volunteer Signal Corps, serving in the Spanish-American War and the Philippine Insurrection. Honorably discharged in 1899, he studied at the Case School of Applied Science until 1901 when he joined the U.S. Army as a 1st lieutenant. During 1903-04, he commanded the United States cables ship *Burnside* during the laying of the first submarine cables to Alaska.

Becoming interested in flying, he made his first balloon flight in 1906 and in the following year was appointed the first head of the Aeronautical Division of the Signal Corps. In that year he was, with J. C. McCoy, the winner of the Lahm Trophy for balloon racing in a 500-mile flight from St. Louis to Walton, W. Va. He was a member of the board of officers that conducted the Wright airplane trials at Ft. Myer, Va., in 1909. Graduating from the Army Signal School at Ft. Leavenworth, Kans., in 1911 he was commander of the Army experiment aviation school at College Park, Md., until 1913. After service in Mexico, he was placed in command of the army balloon field at Fort Omaha, and, in 1917, was made chief of the balloon section of the U.S. Army Air Service in France with the rank of Colonel. For his World War record he was awarded the French Legion of Honor and the American Distinguished Service Medal. On July 1, 1920, Colonel Chandler was transferred to the air service, and on October 18 he retired from active service.

One of the founders of the Institute of Aeronautical Sciences, Colonel Chandler held pilot certificate No. 8 of the Fédération Aéronautique Internationale, and was co-author of *Free and Captive Balloons* and of *Balloon and Airship Gases*, both in 1926.

CHANNEL ISLANDS. See GREAT BRITAIN.

CHAUTAUQUA INSTITUTION. An educational movement established on Chautauqua Lake, Chautauqua, N. Y., in 1874 by Lewis Miller

and Bishop John H. Vincent, both prominent in the Methodist Episcopal Church. Originally for Sunday school teachers, it developed into an institution affording during July and August each year a correlated lecture series, summer school conducted by New York University, operas, and plays. Its summer music festival features a symphony orchestra, concerts, and recitals. Annual attendance is 50,000, the schools enrolling 1600. Present officers are: S. M. Hazlett, Chr. Ex. Bd.; George E. Vincent, honorary president; Arthur E. Bestor, president; Charles E. Pierce, secretary; and Gerald M. Lynch, treasurer.

CHEMISTRY. Outstanding event in 1939 was the tapping of nuclear energy by the bombardment of uranium, protoactinium and thorium with neutrons, thereby releasing 175,000,000 electron volts of energy for each atom split. A satisfactory mechanism proposed by Bethe of Cornell to account for the production of solar and stellar energy by the transmutation of hydrogen into helium has been hailed as the greatest contribution in astro-physics for the past 15 years.

Apparatus. J. Allen designed a vacuum tube containing a series of amplifying beryllium plates which can measure the flow of one electron every five minutes; the General Electric Company produced a 100,000-hour thyroton, a self-regulating 25 million candle-power mercury-arc searchlight, sealed-beam headlights, and a tiny million-lumen photoflash bulb; the Netherlands announced a lamp containing tantalum chloride or boron nitride heated to incandescence, better than tungsten. Other electrical equipment included a 1,250,000-volt electrostatic X-ray generator, one-tenth the size of its 1937 one-million volt precursor at the Huntington Hospital; a sensitive short-circuit detector in chlorinated transformer oils, the hydrochloric acid which is evolved dissolving a zinc-oxide insulation on the detector, thereby operating a relay which shuts off the transformer; an electric micrometer, measuring five-millionths of an inch; a method by W. L. Bragg for converting an X-ray diffraction pattern into an optical image; and a novel arrangement of a horizontal electrical field for measuring the charge on an oil drop, by Labby and Hopper who also described an un-jacketed thermostat for maintaining temperature constant to within $\pm 0.002^\circ$. B. Johnson described a lens system of quartz and synthetic LiF crystals giving complete anachromatism between 2749 and 5461 Å.; Rosenberg achieved accuracies of ± 0.2 and ± 6 per cent at pressures of 10^{-2} and 10^{-6} mm. in an improved McLeod gauge; using a pierced membrane to prevent the creeping of helium II, Cooke and Hull obtained low temperatures with a relatively simple apparatus. New equipment include a sintered nickel filter resistant to lye at 500°C .; a gas mask for helium-oxygen treatments, only one-third as expensive as tents; a viscosimeter consisting of several rotating disks.

Astronomy. In *Physical Review*, Volume 55, page 434, 1939, Bethe proposed a theory which has been recognized as an outstanding contribution. It is a mechanism for the transmutation of hydro-

gen into helium, with carbon and nitrogen playing the role of catalyst, to produce energy in the stars. The mechanism gives the correct rate of energy production in the sun at its central temperature of 20 million degrees. Steps in the Bethe mechanism are (1) $\text{H} + \text{C}^{12} \rightarrow \text{N}^{13}$; (2) $\text{N}^{13} \rightarrow \text{C}^{13} + e^+$; (3) $\text{C}^{13} + \text{H} \rightarrow \text{N}^{14}$; (4) $\text{N}^{14} + \text{H} \rightarrow \text{O}^{15}$; (5) $\text{O}^{15} \rightarrow \text{N}^{15} + e^+$; (6) $\text{N}^{15} + \text{H} \rightarrow \text{C}^{12} + \text{He}^4$. The dynamics of the process are also consistent with the mass-luminosity relations observed in other stars. However, certain faint stars may produce energy by the reaction $\text{H} + \text{H} \rightarrow \text{D} + e^+$.

Mohler attributed ionization 150 miles above the earth to sunspot radiation. Coblenz recommended rhodium rather than silver for telescope mirrors in the visible spectrum; chromium is satisfactory in the ultra-violet. A new optical method using a wire instead of a knife edge in testing mirrors during grinding promises to reduce grinding time to one-third. Wildt explained the range of colors on Jupiter by the action of sodium on gaseous and liquid ammonia. Nova RR Pictoris (1925) spectra, were identified by Bowen and Edlen as forbidden transitions in the $3d^2$ level of the vacuum spark spectrum of iron. Dunham calculated that a millionth of a cubic meter between the earth and X2-Orionis contains 7 electrons, 7 H, 150 Na, 5 K, 3 Ca, and 0.03 Ti atoms.

By September, drillings in the great Arizona crater had disclosed no nickel-iron alloy. Paneth issued an important formula summarizing radioactive methods for determining the age of meteorites. From new alpha-helium and radium-thorium-helium measurements, Urry and collaborators lowered many geological horizons determined from radium-helium accumulation in igneous rocks. The majority of the radium liberated from uranium in sea water is precipitated with iron in marine clays and deposits; since Foyn and collaborators found sea water contained only 0.03 to 0.02×10^{-12} radium.

Isotopes. The value 6900:1 by Gabbard and Dole and by Hall and Jones for the H:D ratio in water was reconfirmed by Dole this year. This would change the atomic weight to 1.0080, instead of the accepted value 1.0081 based on a ratio of 5000:1. Hydrogen of mass 3 was prepared and found to be radioactive. With an improved thermo-diffusion-siphon method Clusius and Dickel using a 36-inch tube obtained 8 cc. of 99 per cent HCl^{37} daily. They also separated sodium chloride-water, acetone-water, and light-heavy water. Relatively large amounts of C^{13} were obtained by chemical separation. A systematic study of the ratio of $\text{C}^{12}:\text{C}^{13}$ was carried out by Nier and Gulbransen. C^{13} is more abundant in limestones and less abundant in plants, with a maximum variation of 5 per cent. Nier also studied the isotopic ratio of uranium and lead. Reinvestigation of the isotopic abundance of europium by Lichtblau pointed to an atomic weight of 151.95 or 151.92. (See BIOLOGICAL CHEMISTRY.)

Kinetics. Ogg reviewed the energetics of hydrolysis of alkyl halides and concluded that CH_3OH_2^+ is much more probable than CH_3^+ , and that mechanisms involving CH_3^+ should be abandoned. According to Semmens, polarized infra-red light from heated platinum gauze increases the hydrolysis of starch in the plant, in the starch grain, and in films of boiled starch. James, studying the reduction of silver ions by hydroquinone on colloidal catalysts in gelatin and

gum arabic, showed the primary step is the adsorption of silver ions on the catalyst. The mechanism of reaction of Wackenroder's solution was elucidated by Stamm and Wintzer. Stoddard showed that an adsorbed film of oxygen poisons the heterogeneous reaction between oxygen and nitric oxide. Griffith and co-workers detected the formation of ozone during the non-explosive oxidation of carbon disulfide on Ni_3S_2 catalyst. Ethylene suppresses the homogeneous oxidation. The polymerization of unsaturated liquid hydrocarbons by neutrons and ionizing radiations was investigated by Hipwood and Phillips. Farquharson and Ady demonstrated the fall in diamagnetism, corresponding to the formation of paramagnetic centers, during the polymerization of dimethyl dibutylene. The induction period terminates when the concentration of centers equals the minimal concentration of catalyst at which a smooth curve would be obtained. Vitamin B₁ accelerates the complete oxidation of acetic acid by vitamin-starved propionic acid bacteria according to Quastel and Webley.

Medical Miscellany. Aluminum dust is successfully preventing and remedying silicosis by forming in the body fluid aluminum hydroxide which absorbs the quartz particles on its surface. The aluminum hydroxide was identified in the Bell Telephone Laboratories by electron diffraction. The quantity of aluminum must be at least 1 per cent of the weight of the quartz dust, and preferably distributed with it, although it will also remove quartz dust previously inhaled.

Dounce and Frampton showed that horse liver catalase annuls the poisonous property of potassium cyanide by destroying hydrogen peroxide formed when cyanide attacks cells in the blood. Migraine headaches were stopped by breathing gases low in oxygen. Nitrogen breathing was introduced to relieve schizophrenia insanity in place of insulin shock or the metrazol treatment which often induces convulsions. All three treatments act by cutting down the supply of oxygen to the brain.

Luyet reported that animal and plant tissues frozen in liquid air regain vitality by quick warming, whereas slow warming dehydrates and kills them. Daily doses of radioactive sodium from the California cyclotron is keeping leukemia patients alive in place of daily X-ray treatments.

McAlister demonstrated that wheat seedlings continue to utilize carbon dioxide for a short interval after they are plunged into darkness, due to the presence of a new chemical, not isolated, which activates the chlorophyll.

George Wald of Harvard identified three light-filter pigments in the cones of the chicken eye, and finally the first light-sensitive pigment ever found in the eye cone, which he named "iodopsin." The spectrum of hemoglobin in the red blood cells is identical with that photographed extracellularly, according to Drabkin.

Slade, Watson, and Ferguson found that treatment with cold lye increases the digestibility by sheep of oat straw 100 per cent, and of wheat straw 150 per cent.

Monomolecular Films. In his address to the British Association in August, Rideal reviewed the research in monolayers of macromolecules such as proteins, methylated starches, and cellulose. These form two-dimensional gels, prototypes of cell membranes. Orientation of the molecules in layers has a bearing on activation energy involved in enzyme and photochemical re-

actions of these layers. Stable complexes, formed by orientation of the penetrant in the monolayer, find analogy to lysis, agglutination, sensitization, and drug action. Penetrants with more than one polar group interlink with the monolayers. Schulman described application of the Langmuir-Blodgett technique in determining the shape and chain-branching in elaborate molecules such as phtoic acid, a toxin from tuberculosis bacillus; data which could otherwise be obtained only by elaborate degradation experiments.

Gregg and Widdowson determined condensation coefficients of stearic acid and arachidic acids, and the free-acid content of barium soaps by submitting molecular films to high vacuum. Jenkins and Norris developed an optical method for measuring the thickness of protein films only a few molecules thick. Schaefer reported photochemical decomposition of layers of stearic acid. Cartwright and Turner, at M.I.T., and Blodgett at the General Electric, have reported films which reflect 85 per cent of the green light and transmit 90 per cent or more of the red light. In some instances transmissions of 99.8 per cent were achieved. Germer reported that monomolecular films of heavy gold and beryllium gave diffraction patterns for three-dimensional crystals.

New Substances. Laubengayer and Engle conducted an X-ray phase study of $\text{Ga}_2\text{O}_3 - \text{H}_2\text{O}$, and established the existence of $\text{Ga}(\text{OH})_3$, and of two forms of Ga_2O_3 . Two non-stoichiometric ranges for chromium oxide, $\text{CrO}_{2.2-2.6}$ and $\text{CrO}_{1.7-1.9}$, were found by Cameron, Harbard, and King. Jezowska and Iodko characterized certain oxy- and hydroxy-halides of rhenium. At Johns Hopkins, Corwin and Ellington discovered a fluorescent yellow compound having only 12 atoms in its basic nucleus. A simple process for making titanium dioxide which darkens in daylight was described by Williamson.

Siegel of Westinghouse produced four-inch single crystals of copper-gold alloy. Muller introduced diamond-metal, a special alloy in which diamonds are set at high temperature and pressure.

By combination at 1800°C ., tantalum pentoxide was formed as golden yellow prisms, or sheets; melting point 365°C .; specific gravity 4.68. It decomposes into tantalum triiodide, hydrolyses in the air, and reacts with oxygen to give tantalum pentoxide.

Nuclear Changes. Hailed as the most important discovery since radioactivity was discovered at the turn of the century, and high light of 1939 has been the release of large amounts of energy from the splitting of uranium. Otto Hahn in Berlin observed in December, 1938 that under low speed neutron bombardment, uranium split into barium, perhaps krypton, and a neutron with a tremendous increase in energy over the bombarding neutron. This energy was so large that eight pounds of uranium would release as much energy as the 6300 tons of fuel oil consumed by the Queen Mary in a single Atlantic crossing. By January this had been confirmed in Bohr's laboratory in Copenhagen, and in various institutions in the United States. Scientists at the Carnegie Institute, and later in August Fermi, Anderson, and Szilard at Columbia reported that there was a [20 per cent] gain in neutrons emitted, making possible a branching chain of reactions which could lead to enormous decompositions of the uranium. The elements now identified from the splitting of uranium are:

barium, lanthanum, strontium, yttrium, xenon, antimony, iodine, rubidium, and cesium, plus a neutron. The total weight of emitted particles is always 239. The total energy of the splitter particles, 1.75 Mev (Million electron volts), is 25 Mev less than theory. Adler and von Halban in France found that cadmium placed in the neutron path became heated.

At the Carnegie Institute it was shown that thorium could be split both by slow and fast neutrons. Protoactinium can also be split.

As a result of the uranium splitting, several questions were raised. The formation of trans-uranium elements by Fermi, pioneer in the bombardment of uranium by neutrons, was questioned by one of his former students, Segre. Fermi had originally failed to find barium, because he had been looking for smaller changes in atomic weights. Again Libby showed that the new transmutation did not disqualify the uranium-lead time-clock method of determining the age of the earth, inasmuch as a natural splitting of uranium by cosmic neutrons would be negligible. Finally astronomers utilized this new knowledge when Cernuschi suggested the origin of cosmic rays from atom smashing of super-heavy elements, atomic weight 26,000 in dwarf stars.

The new 60-inch 220-ton cyclotron just completed by Lawrence of California is producing nearly 50 Mev alpha particles and 25 Mev deuterons. One of its first tasks is to measure the magnetic moment of the neutron. Slightly larger machines are under construction in Japan, at the Carnegie Institute, and in Manchester, England. Lawrence is raising \$750,000 for a 2000-ton 100 Mev machine.

Transmutations this year include platinum into radioactive gold by Pegram; bismuth and lead bombarded with helium to give a substance emitting alpha particles; production by Alvarez and Cornog of radioactive hydrogen of mass three, and an unusual helium of mass three; bombardment of silicon mass 28 by the helium to produce radioactive phosphorus which broke down into silicon of mass 30; and transmutations with electrons for the first time, reported by Notre Dame scientists who changed beryllium, mass nine, into two atoms of helium each with mass four and a neutron. This latter is also a new source of neutrons.

L. P. Smith at Cornell has completed a linear resonant accelerator, which is claimed to have certain advantages over the cyclotron. Only eight feet long and six inches in diameter, and using a short-wave radio generator to provide the alternating potential, this machine accelerates the projectiles in a straight line, stepping them up to half a million electron volts.

Yukawa who first postulated the mesotron (meson) suggested that its radioactive half-life is inversely proportional to its weight, the best value for which to date is between 100 and 160 times that of an electron. The mean life of the mesotron was found to be 25 ten millionths of a second. Automatic cosmic ray recorders indicated greatest mesotron production at the very top of the atmosphere by bombardment of molecules by incoming 2 to 6 Mev cosmic rays, and no production below 14,000 feet.

Bacher and Swanson at Cornell achieved a distinct collimation of neutrons into a beam which escapes through a tube surrounded by a thick wall of water.

Physical Properties. Shankman and Gordon found the vapor pressures of 3 to 23 molar sulfuric acid at 25° disagree with E.M.F. measurements. Dissociation pressures of greenish copper pentadeuterate and trideuterate were studied by Schacherl in the range 20° to 60°C. D₂O is bound more firmly than H₂O.

Bingham and Stookey have shown that the fluidity (θ) and temperature (T) bear the simple relationship $\theta/T = a + bT + \dots$ for many solutions and liquids, excepting alcohols. a is a function of the homologous series and b a function of the molecular weight, so that viscosity can be calculated for any member of a non-associated series up to 10 carbon atoms at any temperature. Sibaiya and Rao derived a simple formula connecting surface tension with molecular mass and the Lindemann frequency. Good values were reported for the 45 cases investigated.

Conflicting data on the viscosity of helium was corrected by Giauque, who showed viscosity to be decreasing rapidly and approaching zero at 0°A. Shalyt related a change in magnetic susceptibility and specific heat for nickel, cobalt, ferrous and chromium chlorides at liquid hydrogen temperatures. He explained it as quenching the orbits of metallic ions in the electric field of the crystal.

Poulter at the Armour Institute of Technology has adapted the spectrograph, viscometer, and other laboratory appliances to the study of materials under pressure as high as 100,000 atmospheres.

Van Praagh reported quartz dust heated to 300° in vacuo does not affect the pH of water; and suggested absorbed CO₂ caused acidity.

Rakestraw, Herrick, and Urry showed that the Atlantic and Pacific waters are saturated with helium and neon at depths up to 3000 meters. This differs from the distribution of oxygen which is completely lacking in some Pacific samples.

The specific heat of methane had two maxima between 12° and 30°K at pressures up to 2000 kg/cm² according to Trapenynikowa and Nil-jutin. D substituted for H has the same effect as increasing the pressure of CH₄. Variation with temperature of the specific heat of potassium dihydrogen phosphate showed a strong anomalous increase at the Curie point, according to Bantle and Scherrer. Rossini and co-workers provided important new data on the thermochemistry of diamond, graphite, and cokes.

Friedman and Carpenter discussed conditions under which the Stokes-Einstein diffusion equation could be correctly applied to substances with molecular weights as low as 180.

The following photochemical investigations were reported: the first pattern of a super-cooled liquid, in this case liquid sulphur at 30° submitted by Das and Gupta; spectroscopic analysis of viruses proteins and nucleic acids by Lavin; infra-red absorption of carboxylic acids by Davies and Sutherland; reflecting power of evaporated metal films from the visible to 450 Å by Sabine. Horodniczy and Jablonski reported that the broadening of the 2537 mercury line by argon was greater than predicted by Lorentz and Weisskopf. Increased absorption of supersonics by carbon dioxide subjected to its infra-red vibrational frequencies was observed by Richardson.

Structure of Inorganic Compounds. Raman and infra-red spectra of triborine triamine, B₃N₃H₆, which is isoelectronic with benzene, was measured by Crawford and Edsall. They calculated free constants and fundamental fre-

quencies, and noted an isotopic effect for boron. Comparison with benzene lead them to accept the benzene frequencies of Lord and Andrews.

Ubbelohde and Woodward found that when deuterium replaced hydrogen in potassium dihydrogen phosphate, a new crystal structure was set up, giving further evidence of a difference between H and D bonds in crystals.

Friend and Allchin attributed the blue and red color of celestine to colloidal gold. Haberlandt and Kohler of Germany showed that 0.01 per cent of divalent europium in certain feldspars caused blue luminescence in ultra-violet light.

Good X-ray analysis by Powell and Ewens showed iron carbonyl to be $(\text{CO})_5\text{Fe}(\text{CO})_3$. It is diamagnetic because of coupling of electron spins.

Bhatnagar obtained evidence from magnetic susceptibility that manganese in borax glasses is divalent. Using heavy oxygen, Herbert and Blumenthal showed that trimethyl phosphate hydrolyses by rupturing at the P-O bond. From magnetic and other evidence, Krishnan concluded that octahedra of water molecules surrounding the cation in iron and rare earth salts are asymmetric.

Emission spectrum of AlH measured by Sten-vinkel indicated an activated state with several anomalies. Randall and Wilkins presented luminescence and photo-conductivity of excitation states in solid salts of uranium and tungsten activated by manganese.

Structure of Organic Compounds. Little has been accomplished on the structure of polypeptides since the days of Emil Fischer. This year a discovery of unusual promise was achieved by E. Pacsu, who thermally condensed tri- and hexa-peptide esters of glycine to give 3×2^8 esters. The final product contained 96 units, one-third the Svedberg unit of 288. His experiments contradicted the cyclol structure proposed by Miss Winch. Frankel and Katchalski also reported condensing amino acid esters to hitherto unknown polypeptide esters of considerable chain length. Allbrecht and Corey conducted an X-ray analysis of glycine. The structure consisted of continuous layers of nearly flat glycine molecules held together by H bonds between adjacent N and O atoms. Interatomic distances between all atoms were given.

Serious doubt was cast on Willstätter's structure for 1,3,5,7 cyclo-octa-tetrene by the discovery of Hurd and Drake that conjugated unsaturation does not exclusively result during pyrolysis of a functional group in the quaternary hydroxide molecule. They found that 1,3 butadiene was not the exclusive product from the pyrolysis of 2,3, butane-bis-(trimethyl ammonium) hydroxide.

Brigl, Gronemeir, and Schultz have obtained an ethyl-thiogluconide with properties differing from the α - and β -forms described by Schneider and Sepp. They claimed that their new compound possesses pyranose ring structure, whereas Schneider's α -compound is a furanose. The same observations were reported almost simultaneously by Pacsu who, in 1937, established that Schneider's compound is a furanose and not a normal pyranoid structure. Brigl, Gronemeir, and Schultz also prepared a new glucofuranose mono-acetoneglucose. The specific rotation of the ethyl-thiogluconide is $+268.8^\circ$, which is 100° higher than Hudson's rule would predict. Haskins and Hudson obtained a 90 per cent yield of l-tartaric acid by resolving racemic acid with 2(d-glucido-

gluco-hexa-hydroxyl)-benzimidazole. Cox and Jeffrey showed that chitosamine is a derivative of glucose, demonstrating the pyranose sugar ring, and showing that in α -glucose derivatives the groups attached to first and second carbons are in the cis position.

From spectrum analysis, Shingu concluded the chelate structure of o,o' -dioxazo benzene is mobile compared to o -mono-oxyazo compounds. Douglas Clark extended his work on dissociation energy and internuclear distances of C-C linkages in both the ground and excited states. Lemberg, Norrie, and Legge found that catalase contains one bile pigment haematin group and three protohematin groups. Perutz obtained the absorption spectrum of a single crystal of hemoglobin and of other derivatives in polarized light.

From X-ray and magnetic measurements Knaggs and Lonsdale concluded that crystalline benzil molecules are skew-shaped; this agrees with recent dipole measurements.

Neurath applying the Perrin diffusion equation, showed with few exceptions protein molecules exhibit high dissymmetry. Cleavage occurs only in directions parallel to the major or minor molecular axis. Cytochrome C, gliadin and erythrocrucorin with molecular weights of 15,600, 26,000, and 31,400 all have a common short diameter of about 18 Å.

Awards and Medals. The following awards were made for 1939 unless otherwise dated. In each case the name of the award, the committee making the award, the recipient, and the nature of the researches are listed. The American Association \$1000 prize to N. Maier for induced neurosis in rats; the Cameron Prize of Edinburgh University to G. Domagk for protosil from which sulfanilamide and related materials are made; the Cannizzaro prize in Rome to Otto Hahn of Berlin; the Cleveland Medal to Eve Curie for the biography on her mother; the Davy Medal of the Royal Society of London to James McBain for colloidal electrolytes; the Eli Lilly Co. \$1000 award to George Wald of Harvard for the relation of Vitamin A to the human eye; the Anna Fuller Memorial Prize, to five doctors of the Research Institute of the Royal Cancer Hospital of London; the Willard Gibbs Medal of the Chicago Section of the American Chemical Society to D. D. Van Slyke for his chemistry of proteins, enzymes, blood, and metabolic conditions of diabetes and nephritis; the 1940 Willard Gibbs Medal to V. N. Ipatieff of Universal Oil Products Co. for high-pressure synthesis, catalysis, and polymerization; the Hoffmann Memorial Medal of the German Chemical Society to A. Szent-Gyorgi; the Hillebrand Prize of Washington to Gilchrist and Wichers for their paper on a new system of analysis of platinum metal; the Morrison Prize of \$500 to H. A. Bethe for his theory of solar energy (see above, under *Astronomy*); the 1938 Nobel Prize in Chemistry to Richard Kuhn of Heidelberg for his chemistry of enzymes, stereochemistry, polyenes, cumulenes, vitamins, and carotinoid; the 1939 Nobel Prize in Chemistry divided between A. Butenandt of Berlin for preparing testosterone and androsterone, the latter from kidney excretions; and L. Ruzicka of Zurich for preparing testosterone, male sex hormone from cholesterol; the 1939 Nobel Prize in Physics to E. O. Lawrence of California for the cyclotron; the 1939 Nobel Prize in Medicine to G. Domagk for protosil and its derivatives; the Pasteur Medal of Paris to Adolf Windaus for his

lectures on vitamins; the Perkin Medal of the Society of Dyers and Colourists to J. Baddiley, who built up British dyestuffs industry; Royal Medals to Dirac for quantum mechanics, and Keilin for his demonstration of the role played by cytochrome in oxidation-reduction mechanisms in the living cell; Research Corporation \$2500 Award and Medal to H. S. Taylor for catalysis; and the Rumford Medal of the A.A.A.S. to G. R. Harrison for his gigantic catalogue of spectral lines.

The Paris Academy of Sciences in December, 1938, awarded the Montyon Prize to the late R. Schmutz for detection of gases; the Jecker Prize to A. Wahl for work on indigoids; the LaCaze Prize to P. Jolibois for inorganic chemistry; the Cahours Foundation to R. Guillemet for chemical analysis; the Houzeau Prize to M. Badoche for work on rubrene and heats of combustion; and the Girard Foundation to R. Quelet for organic chemistry.

Early in 1939 the Vienna Academy of Sciences awarded the Rudolf Wegscheider prize to R. Kuhn for his work on lactoflavine; and the Fritz Pregl prize to F. Hecht for micro-analysis of monazite thorium and uranium minerals.

HUBERT N. ALYEA.

CHEMISTRY, INDUSTRIAL. Self-sufficiency continued to be the industrial keynote in 1939, as rumors of war followed by war itself intensified greatly the efforts of nations to liberate themselves from dependence on foreign raw materials. Governments liberally subsidized native industries. Germany entered the European War with a host of synthetic materials at her command: gasoline, rubber, fats, textiles, plastics, and even foodstuffs all synthesized from coal, air, water, and wood.

The Chinese have accomplished the miracle of transporting in one year 120,000 tons of modern chemical equipment a thousand miles inland to Chungking, where 100 factories turn out paper pulp, cement, steels, copper, tin, mercury, gasoline, and alcohols. Japan has appointed the Pekin Syndicate, Ltd. as sole agent for Chinese tungsten ores, formerly a monopoly of the Chinese Government. About 91 per cent of China's tungsten was exported from Hong Kong in 1938, as compared with 16 per cent in 1935. Favorable weather conditions in North China led to a 800,000 metric ton output of salt as compared with 200,000 tons in 1938.

Egypt is planning the manufacture of pharmaceuticals on a large scale.

The German fuel problem continued. In a carefully reasoned article in *Industrial Chemistry* for November, 1939, A. J. Underwood concluded that Germany will not run short of oil during the present war. Her wartime needs will be helped by lack of civilian and maritime peacetime demands. Whether she can produce aviation fuel is another question. Sections other than North Germany were required to abandon alcohol and to substitute, for the first time, tetraethyl lead. Fischer-Tropsch Kogasin II, mixed with oil from coal, has been used as excellent Diesel fuel. German aviation lubricants are better than castor oil, and are not sticky. They are made by passing an electric discharge through mineral and vegetable oils, a process developed by the Belgian Elektrion Co., and used by the Royal Dutch Shell for its airliner lubricants. H. Pichler described a synthesis at a pressure intermediate between that of the

methanol and the benzene syntheses which gives a crude paraffin suitable for soap and possibly fat. 40,000 tons, one-tenth present consumption, are to be produced.

A 94 per cent conversion of benzaldehyde into toluene was reported by Krebs and Borchert, the benzaldehyde being produced from CO and benzene.

Production of synthetic textiles is increasing. "Pe-Ce," a thermoplastic polyvinyl chloride, for fishing nets, appeared. The first rayon factory constructed under the Four Year Plan began operations at Krefeld. A staple fiber plant to treat 12,000 tons of jute fiber and 36,000 tons of straw cellulose has been erected at Wittenberg. Zelljute, a substitute for jute, will be produced by 1940.

Full-scale production of Buna was realized at Schkopau. Buna S milk, an artificial latex has been made as an emulsion of butadiene and styrol.

The huge blast furnaces of the Hermann-Göring Werke began operations in the fall. The rolling mill has the largest hall in the world, 250 meters wide and 940 meters long.

Airships have been abandoned for lack of helium.

New projects in **Great Britain** included recovery of 220,000 tons of sulphur from gas works; production of casein fiber under Italian patents; distribution of 1,855,000 tons of lime and 400,000 tons of basic slag to farmers according to the Land Fertility Scheme; consideration of a £6,000,000 plant in Lancashire for aviation fuel from coal; completion in 1940 of a pit-head gas-producing plant in Yorkshire, and exploitation of DuPont Nylon by I.C.I.

Since the first month of the war the Government has taken control of all essential raw materials. Six thousand barrels of aviation fuel per day was ordered from the Anglo Persian fields.

India has awakened to national planning. New plants recently opened include thoroughly up-to-date English synthetic ammonia and sulphuric acid plants in Mysore, a \$17,000,000 aluminum works, soda ash in Dharangadhra and Bahjoi, automatic portland cement works with a capacity of 100,000 tons annually at Bhupendra, starch and dextrin at Ahmedabad to meet the annual demand of 14,000 tons, a jute laboratory opened in Calcutta in January simultaneously with a Japanese announcement of a jute substitute, hydrogenation of vegetable oils, and an iron and steel factory at Cawnpore.

Prospective industries include a \$16,000,000 chemical company in Bombay to manufacture heavy chemicals, fertilizers, and special chemicals; and 1500 producer-gas plants within the next two years by the Koela Producer-Gas Plant Co., the largest single contract of its kind ever to be awarded. Processes arousing Government interest include synthetic nitrogen for a rapidly expanding fertilizer industry, Sen molasses-coal-tar roads in place of macadam, synthetic resin from refuse lac, paper from indigenous woods and grasses, improved cotton, carbonization of low-grade oil and coal, substitution of wood and charcoal as a motor fuel; electric furnace steel, electric furnace chemicals, and aluminum to exploit the abundant hydroelectric energy; non-hygroscopic solid molasses for fertilizers, organic acids, and plastics.

The possibility of Italy remaining neutral has intensified chemical research on native materials. The Council for Research has subsidized utilization of lignites, electro-chemical recovery and extraction of tin, copper, and nickel, and a huge

company to develop the gases from the fumaroles and soffione in the vicinity of Pisa.

Twenty-five per cent of Italy's needs for gasoline will be met by its large works at Bari and Leghorn, each having a capacity of 100,000 tons of aviation benzine, 140,000 tons automobile benzine, as well as lubricants and paraffin. Two factories near Leghorn, to be completed late in 1940, will produce 60,000 tons of lubricating oil and 20,000 tons of paraffin. Imported Mexican crude oil is not as good as Albanian and presents problems in treating for aviation fuel. Nearly half of Italy's benzine is by hydrogenation, the other half by high temperature carbonization, and only about 2 per cent by low-temperature carbonization. In 1938, 7,000,000 gallons of aviation fuel was produced. The first Houdry catalytic plant was put into operation by the Italian Socony-Vacuum Company. A new Italian refinery is producing 28,000 tons of paraffin for candles.

By the spring of 1939 natural methane was used in automobiles in the lower Padua valley, in Southern Italy, and near Florence. Power alcohol came from several sources because of the shortage of sugar beets: 30,000 hectoliters from sorghum in Rome; 70,000 hectoliters from 30,000 tons of wood residue near Bolzano by the German Schiller process; and a third process by Giordana and Leone, utilizing any cellulose material now ready to move from the semi-plant stage to a large plant near Bolzano.

The cellulose industry continues to expand. The enormous works of the Snia Viscosa making cellulose pulp for textile fibers from marsh cane near Venice opened in September, 1938. Its largest building has a frontage of more than 1000 meters. The Pomilio Cellulose Process has expanded throughout the world, utilizing corn, rice, oats, straw, esparto, Italian cane, Cusco fir-tree cellulose, and many other raw materials. In November a plant at Varedo began to produce 10,000 kilograms of rayon daily, and soon expects 50,000 kilograms of short fibers daily. The quality of lanital has improved and now constitutes 30 per cent of the army clothes. "Railan," a new rayon thread made its appearance.

Italian synthetic rubber from the polymerization of butadiene derived from calcium carbide is similar to Buna. A new plant for calcium carbide and cyanamide was created at Carrara. Rubber plants are also being grown.

Italy is now independent of Chilean nitrate for industrial and military explosives, and for fertilizers. Three-quarters of the Italian caustic alkali demand for textiles as well as outlets for chlorine are met by the Electrolytic plant at Rosignano.

In Japan the promotion of chemical industry which reached a high level in 1938 slipped more than 75 per cent during 1939. However, industrial leaders predict that Japan will inevitably make another giant stride toward world chemical power as the European War drags on, just as during the World War she laid the foundation for a chemical industry which has since become the world's fourth largest.

On April 1 a three year plan was endorsed to increase synthetic gasoline 2900 per cent and synthetic heavy oil 800 per cent. Two 30,000-ton Fischer-Tropsch plants were completed in Manchuria, and a 140,000-ton plant will be built in 1940. Japan could not pay the 15 million dollars asked for the patent rights to the Standard Oil-I.G. hydrogenation process. Eight leading Japanese oil concerns are to produce aviation fuel.

Experts are testing pulverized coal suspended in oil and injected into a Diesel type engine. Aviation lubricant of reputed quality is being manufactured from fish oil. Synthetic methanol production has started with capacity at 23,500 metric tons, and will be increased to 950,000 gallons within three years.

The Fertilizer Control Bill drove chemical companies to other fields; and as a result there will be only 1,370,000 metric tons of ammonium sulphate available against a demand for 1,760,000 tons for 1939. Also calcium cyanamide and superphosphate imports from Germany and France have ceased because of the war. Plants are turning from ammonium sulphate to urea and methanol, and electrical power has turned to munitions.

The textile industry is suffering from lack of German dyes since the dye import was curtailed from 17,000,000 to less than 3,000,000 yen in 1938. Production will start on German chemicals previously imported. New plants include two French-Japanese Claude liquid-air plants at Hirohata and Kobe; butanol and ethylene glycol from wild potatoes; 10,000 pounds monthly of mucilage from seaweed; 120,000 metric tons of Mongolian cement annually; a large increase in exports of matches to China and Iran; 40 tons of phenol per month; self-sufficiency in carbon black by February, 1940; a 25,000 ton electrolytic soda and chlorine plant; and an explosives industry which is now booming.

The German Krupp-Renn process for iron concentration cost Japan 10,000,000 yen, about three times the entire cost of the original research development. Japan is to exploit the immense coal and iron deposit near Korea. Development by the end of 1941 calls for treatment of 1,300,000 metric tons of coal, 1,300,000 metric tons of iron ore and an iron and steel works with a capacity of 500,000 tons of pig iron and 100,000 tons of steel. The light metal research laboratories have raised a cry for self-sufficiency, and the aluminum and magnesium industries are growing. Refining of nickel from local ore deposits will turn out 10,000 metric tons of nickel-chromium steel, 5000 tons of stainless steel, and 1000 tons of nickel by the end of August, 1939. New Caledonian ore, newly acquired by Japanese interests, is expected to produce 5000 tons of pure nickel annually.

Japan is planning a synthetic rubber program, although negotiations for DuPont neoprene patents failed.

Efforts to render Japan's rayon and staple fiber industry independent of foreign supplies has failed, for although the demand for the staple fiber, rayon, and cellophane industries reaches 365,000 tons, only 58,000 tons were licensed for importation by the Government. The Ohara plant is to produce 20,000 tons of pulp annually for paper and rayon from Japanese sugar bagasse. Twenty-one companies are attempting to produce paper and pulp from a variety of local materials, but with little success so far. Japan is substituting soybean casein for milk casein in synthetic fibers, and artificial wool from whale meat; the latter mixed with cellulose xanthate gives a silk-like fiber. The fiber industry is attempting self-sufficiency in carbon disulphide of which 13,600 metric tons are required annually.

The camphor monopoly has been broken by DuPont, which began in 1932 to manufacture it synthetically from turpentine for celluloid, drugs, and explosives.

In Manchoukuo the five-year industrial plan

now in its third year concerns rubber, magnesium, aluminum, leather, and cement.

The exportation of citrus fruits from Palestine to many new European ports has been made possible by the discovery of A. Farkas in Jerusalem that wrapping fruits in diphenyl-impregnated paper extends their life ten-fold.

Russia expects to achieve self-sufficiency in rubber by 1942; synthetic rubber already meets two-thirds of their needs. In the recent partitioning of Poland, Russia gained 75 per cent of the oil fields, and 50 per cent of Poland's refineries; but Germany gained the newly-created industrial plants in the so-called safety triangle around Sandomierz. Russian magnetic ore at Kursk, containing 67 per cent iron, and about half the total world iron resources, will yield about 300,000 tons a year beginning in 1940. A plant near completion in Leningrad will convert 300,000 tons of dry peat into gasoline and other derivatives.

In the Scandinavian countries a number of new plants were opened. Finland commenced production of 400 kilograms of rayon a day and an equal quantity of cellophane, one-half the consumption of the country. Sweden is considering the Peco treatment of peat to give a tar suitable for high-pressure hydrogenation to gasoline. At present gasoline is blended with 25 per cent ethanol, a waste product which at present amounts to 30,000 metric tons annually from sulphate pulp. 40,000 metric tons of calcium cyanamide will be produced annually near Stockholm. The Consumers' Co-operative Union at Sweden is manufacturing electric light bulbs, rubber, flour, vegetable oils, viscose and acetate rayon, superphosphate fertilizer, linoleum, and heavy chemicals. In all of these, research plays an important part; for example, 80 per cent of the rayon profits are turned back into developing the cellulose from the Swedish forests. Norway, in increasing self-defense is considering a 110,000 ton rolled steel mill, using pig iron from the electric furnaces in the vicinity of Mo in north Norway.

In Transvaal, South Africa, the first paper pulp plant was opened at the end of 1938. Using the Pomilio process, resinous and non-resinous woods will produce various pulps, chlorine and derivatives, and caustic soda. The sisal industry is well established in Kenya now, but the flax industry has been less successful.

In South America, Argentina is considering deep ranges. A sum of \$2,000,000 was allowed for the topping, cracking, and polymerization plant at the La Plata refinery. Tungsten production was greater than for any year since 1917. Bolivia possesses 250,000 tons of tin reserve, its most important export, and in 1939 will export its quota, 1750 metric tons. In January Brazil launched a five-year program for developing public works and national defense. Discovery of petroleum in Bahia aroused great interest, for although Brazil has enormous water power, it needs petroleum. Substitutes for gasoline being considered include shale oil, wood and charcoal which are plentiful, and alcohol, addition of which to gasoline is obligatory. Native castor oil is substituted for imported lubricating oil. Efforts are being made to develop a coal industry, fixation of atmospheric nitrogen, purchase of the entire output of superphosphate from Ipanema apatite, and intense interest in plastics from coffee. For the first time pig iron was exported. In Chile the first shipment of manganese went out in May, 1938. It also produces gold, platinum, iridium, cuprous pyrite,

graphite, as well as copper, silver, and saltpeter.

United States. The Southland Paper Mills, Inc. near Lufkin, Tex., on May 27, 1939, opened a \$6,000,000 newsprint plant, the first to use common Southern yellow pine. Capacity will be 50,000 tons a year. Operations will be keenly watched by paper manufacturers. Ethyl Gasoline Corporation plans a \$4,000,000 expansion at Baton Rouge, La. The Texas Corporation and other oil companies are installing petroleum catalytic cracking units costing many millions of dollars. The Union Carbon and Carbide Corporation are to acquire the Bakelite Corporation, manufacturers of cellulose acetate, urea-formaldehyde, and polystyrene plastics, thus bringing the manufacture of raw materials closer to the consumer. The \$8,500,000 Nylon plant at Seaford, Del., will be completed early in 1940. A second unit is already being built. Also DuPont is spending \$2,500,000 on plant extensions at Belle, W. Va., for making Nylon intermediates. A 25,000,000 lb. plant of the American Viscose Corporation opened at Front Royal, Va. The International Agricultural Corporation is to spend \$2,500,000 on potash minerals near Carlsbad, N. M. Matheson Alkali salt cake by their new process will soon be available. The cornerstones of the regional research laboratories of the Bureau of Agricultural Chemistry and Engineering, Department of Agriculture, were laid in 1939.

Miscellaneous. The I.G. at Oppau, Germany, perfected a series of thermotropic plants from 30° to 440° C for indicating temperatures on aeroplane parts. Dow patented a process for liberation of iodine from brine, adsorption on active carbon, and subsequent precipitation of the iodine from the anode of an electrolytic cell. Lignin was found an effective adsorbent for iron in water. A simple method was reported for manufacturing thiodiglycol, starting point for mustard gas.

Thaysen in England reported a bacteria which fermented kerosene to 10 per cent ethane and 90 per cent methane. Tobacco free from nicotine was grown near Naples. Dunstan and Duncan discovered that certain thiocyanates increased the red pigment, idaein, in apples. Hofius kept milk palatable at low temperatures in an atmosphere of oxygen. Simons urged the use of HF in industrial organic catalysis. Sherwin-Williams substituted Dehydrol, 9-11-octadecadienic acid, a dehydroxylated castor oil, for tung-oil in paints.

The Mellon Institute reported improved raw material for ceramics, a superior dry cleaner, cheap X-ray paper, synthetic lubricants for watches, a plasticized sulphur binder for bricks, skylights, and roads, use of the X-ray to detect the large core which forms in Japanese cultured pearls, and tenderizing meat by heating and simultaneously exposing to ultra-violet light to kill bacteria.

By forming tough films of 0.02 per cent starch acetate in water around coal, DuPont was able to extend its sink-and-float process to separating coal from slate. Parting liquids such as pentachloroethane or tetrabromoethane are used.

See also ENTOMOLOGY, ECONOMIC; FERTILIZERS; GLASS; METALLURGY; SOILS.

Nitroparaffins. Commercial Solvents Corporation and Hercules Powder Co. are building a plant at Peoria, Ill., to develop the vapor phase nitration of the paraffin hydrocarbons by oxides of nitrogen, patented several years ago by Hass of Purdue. Natural gas converted to nitroparaffins is condensed with formaldehyde to give explosives

such as nibglycerol trinitrate and nibglycol dinitrate at a price which will keep glycerin as an explosive raw material to 15 cents a lb. During the World War it rose to a dollar a lb. Nitroparaffins are active solvents for cellulose nitrate, resins, fats, and dyes. Mixed with alcohols they are solvents for commercial cellulose acetates. Nitroethane is a heat sensitizer which gels latex; while chlorinated nitroparaffins are antigelling agents, useful in rubber cements. Several hundred derivatives have been prepared from the nitroparaffins, and the process holds considerable promise.

Petroleum. The 125,000,000-gallon aviation market will shortly be supplied with 100-octane gas which a decade ago cost \$30 a gallon. Production has been 7, 20, and an estimated 33 million gallons for 1937, 1938, and 1939 respectively. Chief processes are alkylation of isobutane, or dehydrogenation followed by polymerization or alkylation of lower hydrocarbons to C₆- and C₇- mixtures. In November five large oil companies pooled their researches on catalytic alkylation with sulphuric acid as catalyst. To increase sensitivity to tetraethyl lead, sulphur is cracked out. This year several large Houdry plants produced retail gasoline.

Petroleum Gases. Butanes are being stored in gasoline at below 40°F to increase volatility and reduce knock. Liquid propane, in addition to the 150,000,000 gallons consumed as bottled gas each year by the housewife, is used as a solvent in removing, separately, wax, asphalt, and heavy ends from crude lubricating oils.

The first use for refinery gas was the conversion, 18 years ago, of propylene into isopropyl alcohol, cutting its price to 1/20th. Next, in 1922, came the production of ethylene glycol from cracked gasoline; it was used as an anti-freeze, and mixed with nitroglycerine to give a low-freezing explosive. Later the lower olefins were used as the starting materials for alcohols, acetone, thiokol, vinyl and acrylate resins, and amines. The higher olefins have yet to be used. Paraffin hydrocarbons are usually first cracked to the olefins. Butylene is converted to butadiene and polymerizing to Buna rubber. Chlorination of the paraffin hydrocarbons is useful, but direct oxidation is of doubtful commercial value because of the complexity of the reactions.

By far the greater portion of the refinery gases, however, are catalytically alkylated and polymerized, or thermally cracked and subsequently alkylated and polymerized. Approximately 300,000 gallons of aviation fuel per day are produced by this method.

Plastics. The history of plastics begins with *cellulose plastics*, when celluloid was manufactured by Hyatt in 1868 in Newark, N. J., from camphor, alcohol, and cellulose nitrate. The latter is sold today as pyroxylin. Much later, Tennessee Eastman perfected camera safety film or cellulose acetate. Today these products are sold by the Bakelite Co. as Bakelite Cellulose Acetate; by the Celluloid Co., as Lumarith; by DuPont as Plastacele; by Monsanto as Monsanto CA, and by Tennessee Eastman as Tenite I. Admixtures of plasticizers form solid solutions which may be tough, or strong, or good insulators, or easily milled, or readily colored. They are unaffected by alcohol, cleaning fluids, oils, or sunlight. Their resilience and attractive colors make them suitable for automobile steering wheels and dashboard panels; for cosmetic containers, elec-

trical appliances, hardware, radio parts, and cabinets, and personal articles such as costume jewelry, brush handles, fountain pens, and combs. Production for the first seven months was 5,230,499 lb. of nitrocellulose sheets and 5,517,159 lb. of cellulose acetate molding compositions as against 3,114,890 and 3,154,066 lb. respectively for 1938. Cellulose acetate sheets, rods, and tubes more than doubled. Hercules Powder Co. improved the molding properties of moisture-resistant cellulose aceto-butyrate, Tenite II, used for automobile steering wheels. Tenite I proved stronger and more durable than black walnut gunstocks, a fact of military significance in view of the scarcity of seasoned black walnut in 1917-18. Ethyl cellulose by Dow is a similar product that is useful as a coating.

Condensation products constitute another major division of the plastics field. In 1909 Baekeland in Yonkers, N. Y. produced the first plastic of this type by condensing phenol with formaldehyde. Today two sorts of phenol-formaldehyde products are marketed. First, Bakelite, and Durez are molding powders to mix with wood, flour, mica, or asbestos; and this upon baking will harden permanently in a mold. The same powder without filler poured into a mold and cured, often under pressure and heat, solidifies in a few days into the second type of product, slabs, rods, tubes, and the like. In this form they may be drilled, stamped, and turned. Catalin is the chief producer. Lately the Shaw Insulator Co. and others have developed a special method called "transfer molding." The phenolic resins withstand temperatures at which rubber celluloid and natural resins soften, liquefy, or decompose. They are used successfully in telephone equipment and electrical insulation, for silent transmission gears, and for handling corrosive acids. Monsanto is producing sixty-inch neon signs of cast phenolic resin to inlay highways as Illuminated Guide Lines.

The resins are modified by heating with glycerin, with common resin, or with sulphuryl chloride. The condensation of formaldehyde with urea, thiourea, or other substances containing amino groups produces similar resins such as Plaskon, Beetleware, and the German Polloplas. Alkyd resins such as the glyptals, are formed from the condensation of glycerin and phthalic anhydride. News of condensation resins for 1939 includes the use of glyptals for the first time as an exterior coating on the copper walls of the General Electric building at the New York World's Fair; a Bakelite-impregnated fibrous board reported suitable for large-size molding as in refrigerators, and automobile doors; a process for molding color inlay, a new German glass-clear urea-formaldehyde solid, HFK, for imbedding plant and animal tissue; Marblette Quick-Set Resin No. 2 which hardens in 24 hours; and a water-resistant adhesive containing urea, formaldehyde, starch, and 15 per cent ammonium chloride by Rangel in Brazil. Investigation of molded and laminated parts has been extensive. In Germany, for example, a phenolic plastic automobile body has been pronounced partially successful. Recently the Clark Aircraft Corporation aroused considerable interest by molding a fuselage from Duramold hardwood veneer bonded with phenolic resinoid. The Timm Aircraft Corp. will build a Howard Hughes pursuit racer from sprucewood impregnated with phenolic resin. The Aircraft Research Corp. developed methods for mass production of

resin-impregnated parts. The urea product "Kaurit" is used in aircraft manufacture in Germany.

The third, and extremely active, division of plastics has been in the field of *polymerization*. These plastics are sold in the monomeric form for warm-setting, or more frequently already polymerized as molding powders. Research has concentrated on copolymers rather than simple polymers. The polymerization of styrene, $C_6H_5CH:CH_2$, has been known for a hundred years, but polystyrene by Dow, as Styron, has been on the market only two years. Five per cent divinyl benzene may be added to overcome brittleness. A second type of polymer is formed from the acrylates, such as ethyl methacrylate $CH_2:C(CH_3) \cdot COOC_2H_5$. Known for nearly a hundred years, they were manufactured by Röhm of Darmstadt, Germany, who obtained a patent in 1912 on the use of the acrylates as a rubber substitute. By 1931 Röhm and Haas Company of Philadelphia were manufacturing both acrylates and methacrylates. They market the methyl methacrylate as Plexiglas and Crystalite; while the DuPont product which appeared about five years ago is called Lucite. Optical glass made of this polymer will not shatter; cubes of it molded with protruding corners make effective Stimson roadway night-reflectors; internal reflection in rods adapts it to piping light to inaccessible places for dental and medical surgery; a car molded from it was displayed at the New York World's Fair, also a dazzling block equivalent in size to a 57,000 carat diamond, and crystal-clear blocks containing butterflies, and other mountings. The production of the acrylates has been through ethylene cyanhydrin $C_2H_5OH(H_3PO_4) \xrightarrow{(NaCN)} C_2H_4(Cl_2 + H_2O) \xrightarrow{(ROH + H_2SO_4)} CH_2OH \cdot CH_2Cl \xrightarrow{(CN)} CH_2OH \cdot CH_2CN \xrightarrow{(ROH + H_2SO_4)} CH_2:CH \cdot COOR$. Analogously the methacrylate esters are manufactured via the acetone cyanhydrin $(CH_3)_2CO \xrightarrow{HCN} (CH_3)_2C(OH) \cdot (CN) \xrightarrow{(ROH + H_2SO_4)} CH_2:C(CH_3) \cdot COOR$.

This year Smith and Claborn of the U.S. Department of Agriculture developed a method which may compete with the cyanhydrin process using as raw material fermented lactose from milk whey. There are 2,700,000,000 lb. of lactose available in the U.S. annually. This method may be of some significance to Italy where casein milk is being converted into lanital and the whey fed to swine; the lanital coated with the polyacrylate would be resistant to poison gas. Still a third class of polymerization products are the vinyl compounds, starting for example with vinyl chloride, $CH_2:CHCl$. Since polyvinyl butyral does not become brittle when cold, it is replacing cellulose acetate for safety glass and a sheet 0.02 inches thick sandwiched between plate glass does not require sealing at the edges. DuPont has developed Butacite for safety glass. Alvar, Butvar, Formvar, and Gelvar are by the Shawinigan Products Corp. Monsanto has developed polyvinyl acetal resins for automobile safety glass, and polystyrene molding materials for household use. Carbide and Carbon Chemicals Corp. are producing Vinylite, copolymers of vinyl chloride and vinyl acetate, as transparent or colored sheets for men's belts, wrist watch straps and garters. It will elongate 250 per cent, with a ten-

sile strength of 300 pounds to the square inch. (See section on *Textiles* below.) Numerous Dow patents covered vinylidene chloride plastics. A fourth class of polymerization products are the polymerized hydrocarbons similar to Cumar, para-coumarone-indene resin.

Continued search for new raw materials has developed plastics from lignin, corn, soybean, manitol, and sorbitol, and coffee bean. Pliofilm is a rubber plastic which does not need vulcanizing. Knight at the Bureau of Chemistry and Soils described a molding plastic from soybean protein which did not have to be given the prolonged hardening process necessary with casein plastics. H. Polin of New York prepared a plastic from the coffee bean which is either thermo-setting or thermoplastic, in a variety of colors, degrees of hardness and resiliency. It can be drilled, molded, and so forth. Marasco and Merritt developed a special plastic containing lead powder as a shield against X-rays. "Resistoflex PVA," a polyvinyl alcohol substitute for rubber; polymerized cyclopentadiene and sulfonamide resins, flexible shellac; "Flexilac" and flexible casein "Protoflex" are now available.

Progress continued on the first inorganic plastic, the films of bentonite clays invented by Hauser at Massachusetts Institute of Technology. Bentonite clays are used to seal leaks in earth dams, since they swell to many times their dry size. But Hauser has prepared films which do not swell; they are thin, almost transparent; and are offered as Alsifilm, a strong, flexible, waterproof, crease proof substitute for imported mica in electric commutators.

Rubber. The 100th anniversary of the discovery of vulcanization by Charles Goodyear was celebrated on February 23 at Akron, Ohio. Four million people are employed in the production and distribution of rubber goods which in 1937 retailed for over two billion dollars. Monsanto showed that Santobrite, sodium pentachlorophenate, plus a small amount of ammonia will preserve latex at plantations for storage. Dewey and Almy marketed Cryo-vac, transparent-thin latex bags in which vegetables or as much as a 350 pound side of beef may be tightly encased in a carbon dioxide atmosphere to prevent evaporation, rancidity and freezer burns. U.S. Rubber produced a thin rubber membrane containing 6400 holes to the inch square inch for filtering membranes, and porous bathing suits and girdles. Goodrich made an automobile spring containing three pounds of rubber and seven pounds of metal; the rubber is under compression and torsion pressure instead of the usual strain and tension. They also perfected Koroseal linings, which do not require vulcanization, for industrial acid tanks. Neoprene production from 2 chlor-1, 3 butadiene now equals 1 per cent of the total natural rubber production in the U.S. A Neoprene-coated conveyor belt for oily coal is in use. Glenn Martin Co. announced a vibration-proof airplane Mareng fuel tank made of Neoprene-coated fabric. The University of Alabama developed a sulfur material, similar to Thiokol. It loses its rubber-like properties in solution, and regains them upon coagulation with acid, suggesting an easy way to impregnate cloth. In Java a road base, Mealorub, containing 96 per cent rubber has been compounded.

Textiles. Raw materials for textiles include casein, whey, woods, and grasses, soybean impregnations of rubber and plastics, glass fiber,

metal fiber, and threads of plastics or protein from coal, air and water.

The increase of world rayon production from nothing to nearly two billion pounds a year has taken place within a generation. Rayon heretofore manufactured as a continuous fiber has only recently been produced with the kink and resilience of animal fibers.

Lanital from skim milk was patented by Ferretti on Aug. 28, 1935, in Italy and is now produced all over the world. It is estimated that approximately 7,000,000 pounds of casein fiber was produced in 1938. Casein fiber is entirely casein, one pound of casein producing one pound of fiber. It may be cut to any length, has a fine kink, is smooth (not scaly like wool) and does not shrink or crease much. Its disadvantages, like those of the early rayons, are a comparatively poor tensile strength when wet. The potential supply of skim milk is forty billion pounds, yielding one billion pounds of casein fiber, which is equal to half the world rayon consumption. Its cost in Italy is 40 per cent that of wool. Britain and Japan have acquired rights for modifications of the Ferretti process. A Dutch firm, AKU, is producing Lactofil, a different casein fiber made without first removing the casein from the skim milk. Soybean protein may be utilized in place of casein.

Synthetic coatings for fabrics are attracting considerable attention: urea-formaldehyde resins to prevent shrinking; glyceryl-phthalate resins to waterproof; beetled finish to give a soft linen finish; and vinyl resins for a variety of finishes.

In 1938 Carbide and Carbon Chemicals Corporation in competition with DuPont Nylon, produced Vinyon, a polyvinyl acetal resin as fine as natural silk, waterproof, fireproof, and more elastic, unaffected by mineral acids and alkalis, not attacked by bacteria and fungi, non-shrinkable up to 65°C, and with good knitting properties. A gossamer-like stocking of Vinyon was displayed at the Chemical Exposition in New York in December 1939. Production of Vinyon will be handled by the American Viscose Corp. from Carbide and Carbon Chemicals Corporation intermediates. The Shawinigan Chemicals Ltd. of Montreal have similar patents, and the I. G. in Germany makes a thermoplastic fish-net, "Pe-Ce," of polyvinyl chloride. Koroseal, developed after five years of research in the Goodrich laboratories, utilizes plasticized polyvinyl chloride, and ranges from soft grade Korogel to hard Korolac.

Nylon (See NEW INTERNATIONAL YEAR BOOK 1938, page 143) yarn hosiery was placed on sale at Wilmington, Del., on Oct. 24, 1939, with an estimated production of 5,000,000 pairs in 1940 at \$1.15 a pair. In addition to brush bristles, stockings, and fish lines, Nylon (Zytel) is superior to silk for sutures since it is non-capillary and is thus less likely to carry infection, and it is tough for parachute and ammunition bags. Japan is naturally concerned over the advent of Nylon, and the Government has contributed \$1,180,000 yearly to textile research to meet the challenge.

Textile news includes an ethyl cellulose fiber, Ethoraon, by Dow; Duraklad, acid-proof fabric by Stanley; Permalon fiber by Pierce Plastics; a patent to Standard Oil Co. for elastic fibers from polyisobutylene; soybean fiber by Glidden Co. and by Ford. Coatings included Rhoplex W-66 by Röhm and Haas as a water-dispersed, colorless synthetic resin; DuPont Avitex, a finish-

ing agent for spun rayon; Mazein and Mazite, prolamine zein for paper; General Electric Formex wire, coated with polyvinyl formal resin; alkylated amine-aldehyde resin and the intermediate material dicyanodiamide for melamine coatings by American Cyanamid; Textac, for cotton, by Hercules Powder Co.; Pervel, a treated paper which feels and looks like cloth, for aprons, pillow cases and curtains; and a fish-skin fiber having a solidity 25 per cent higher than natural silk.

A. J. Hall described a process for treating wool with sulfuryl chloride to render it completely unshrinkable. Monsanto announced the substitution of dipotassium phosphate and sodium potassium ethyl phosphate for olive oil in wool processing; this eliminates the necessity of washing out the oil with soap and leaves the cloth fluffy. Smith and van der Heide of Amsterdam investigated bacteria which destroy all the lanital in a textile containing 50 per cent wool, 50 per cent lanital. Boiling the fabric destroyed the bacteria and the digestive enzyme which it produces.

Awards and Medals. The Edward Goodrich Acheson Medal was presented to F. C. Frary for achievements in the metallurgy of aluminum; the Bessemer Gold Medal of the Iron and Steel Institute to James Henderson; the 1939 Borden \$1000 Award to L. S. Palmer for his chemistry of milk; the John J. Carty Medal and \$3000 to Sir William Bragg of the Royal Institution in London for his crystal structure studies; the C. F. Chandler Medal of Columbia University to T. H. Chilton of DuPont for his unit engineering processes; the Chemical Engineering Achievement Award of Chemical and Metallurgical Engineering to the Standard Oil Development Co. for large-scale production of new aviation fuels; Chevreul Medals in Paris to Ipatieff and Armstrong for catalysis and hydrogenation; the Herty Medal to F. K. Cameron of N. Carolina for research on cellulose in cotton; the Lamme Medal to T. A. Boyd for his fuel researches; the 1940 Perkin Medal of the Society of Chemical Industry to Charles M. A. Stine of DuPont; the Schoelkopf Medal to Charles F. Vaughn for alkali and chlorine work; the Edmund Thiele Commemorative Medal to Fritz Gajewski for manufacturing pulp from sulphite from German beechwood; and the first Vermilye Medal by the Franklin Institute to L. H. Brown, President of the Johns-Manville Corp.

Bibliography. See *Science News Letter*, Volume 35, page 247, 1939, and Volume 36, page 263, 1939, for résumés of important publications during the year.

HUBERT N. ALYEA.

CHEN LU. A Chinese diplomatist, assassinated in Shanghai, Feb. 19 or 20, 1939. Born in Fukien, China, Mar. 22, 1876, he was educated at the Foochow Arsenal School and Paris University (1906). Entering the diplomatic service, he was attached to the Ching Imperial Commission to study the constitutional systems of various countries in Europe and America in 1906, and in the following year he was made secretary of the Chinese Government Delegation to The Hague Conference. He became a counselor in the Foreign Office in 1909, chief secretary to the Board of Foreign Affairs in 1909, and director of Political Affairs during 1910-11.

Appointed minister to Mexico in 1914, he was named Chinese Plenipotentiary at the Sino-

Russian-Mongolian Conference at Kiakta in 1914, resident-general at Urga, Outer Mongolia (1915-17), vice minister of foreign affairs (1918-20), and minister to France (1920-27). Chinese delegate to the League of Nations in 1923, he became adviser to the minister of foreign affairs in 1934 and served until 1938, when he became minister of foreign affairs in the Nanking Government. His prominent position in the puppet government set up at Nanking by the Japanese was believed to have led to his assassination.

CHICAGO, UNIVERSITY OF. An institution of higher education and research in Chicago, Ill., founded in 1890. Privately endowed, the university is coeducational and nonsectarian, although not less than three-fifths of its trustees must be members of Christian churches, and a majority of the three-fifths must be Baptists.

The University is organized on the Chicago plan, which enables students in both the college and the divisions to progress as rapidly as they wish, taking examinations when they feel they have mastered the subject at hand. The general organization of the University is as follows: the college, comprising the first two years of work, in which the student takes general survey courses in the humanities and the physical, biological and social sciences; the divisions, comprising the last two years of undergraduate and the subsequent years of graduate work, during which time the student specializes in his field of major interest and also takes courses in related fields; and the professional schools, viz.: law, medicine, divinity, education, library, social service administration, and business.

In 1937 the University also set up the four-year junior college, designed for students who have had six years of grammar school and four years of high school. The junior college incorporates the last two years of the present high-school with the first two years of present-day college work, and is designed to give students the best general education the University can provide. At the same time it is recognized that each student will have some special interest, and each student's program is accordingly planned so that he will have time to develop this special interest or acquire a mastery of subjects and techniques needed for advanced university or professional work.

During the summer quarter of 1939, 4098 students were enrolled in the University; 2063 men and 2035 women. In the autumn quarter of 1939 there were 7542 students enrolled; 4438 were men and 3104 women. Of this total, 3806 men and 2205 women were in the divisions and professional schools, and 632 men and 899 women were in the University College (downtown division offering evening and Saturday courses). Of this same total, 7542, there were 1985 men and 1339 women graduate students, 2118 men and 1302 women undergraduates, 335 men and 463 women students-at-large. The total enrollment for the academic year 1938-39 was 12,520, which was an increase of 800 over the previous year. The Home Study (correspondence department) had an average enrollment of 3684, which is exclusive of the totals given above. The University granted 1768 degrees during the academic year; 497 were Master's de-

grees and 178 were Doctorates of Philosophy.

The total funds held by the University as of June 30, 1939, amounted to \$125,835,441, a decrease of \$410,923 over the same figure for the same date in 1938. These funds were divided as follows: Endowment, \$70,944,248; plant, \$44,436,453; other funds, \$10,454,740. The total income of the several divisions of the budget was \$8,375,444, an increase over income of the previous fiscal year of \$160,428. This total of budget income does not include income of auxiliary enterprises such as residence halls, commons, bookstore, and student social facilities, nor restricted expendable gifts. Including such income, the total current income for 1938-39 was \$10,567,953. The total amount of gifts paid in was \$1,308,672.

Among the outstanding events of the academic year 1938-39, and the calendar 1939, was the setting up of the Alumni Foundation, looking to celebration of the University's fiftieth anniversary in 1941.

The department of education instituted the workshop method during the 1939 summer quarter, for secondary teachers and the first college workshop in the country. This program, developed by Dr. Ralph W. Tyler, chairman of the department of education, enables teachers to map courses and devise tests for measuring their educational effectiveness in co-operation with curriculum and examination experts and in conjunction with fellow teachers.

Arthur Holly Compton, Nobel prize winner and foremost experimentalist in the field of radiant energy, and the University's department of physics were host to a symposium on cosmic rays at the University, which brought together leading investigators in the field from all parts of the world, including four Nobel prize-winners.

The Cowles Commission for Research in Economics, a leader in the movement to integrate economic theory with mathematics and statistics, moved its headquarters to the University, with Theodore O. Yntema, professor of statistics, appointed director of research.

Taking advantage of the presence of the statisticians of the Cowles Commission and other statistical experts on the faculty and in the city, the University's committee on statistics formed the Institute of Statistics, to provide introductory and advanced statistical training applied to business, industry, and science. The committee appointed Joel Dean, of the University faculty, director of the institute.

The year marked another forward step in the educational radio broadcasting when in conjunction with Columbia Broadcasting System the University began the "Human Adventure," a series of dramatizations of research conducted by University faculty members. (The University Round Table, an N.B.C. network feature, with ten years' steady broadcasting, is the oldest continuous educational program on the air.)

Facsimiles of paintings, drawings, and prints, part of the Max Epstein Art Reference Library, were shown to the public for the first time.

Ralph Buchsbaum, instructor in zoology, Clarence H. Faust, assistant professor of English, and William C. Krumbein, assistant professor of geology, were awarded the annual \$1000 prizes given by an anonymous donor for the three best teachers of undergraduate students.

Fifteen men and women were added to the faculty during the year. These included: Dr. John Knox, author, preacher, and religious scholar, as associate professor of preaching; Dr. Bruno Rossi,

regarded as the leading European student of cosmic rays, as research associate in the department of physics; Dr. George Otis Whitecotton, formerly superintendent of Stanford university hospitals, as superintendent of the University Clinics; and Drs. C. L. Cushman, Herbert Abraham, John L. Bergstresser, and Daniel A. Prescott, as members of the department of education.

The University Press listed 127 publications for the academic year, in addition to sixteen scholarly journals, and the release of two sound motion pictures in biology. *The International Encyclopedia of Unified Science*, Otto Neurath, editor, got under way with publication of parts i-iv of Vol. I, "Foundations of the Unity of Science." *The Dictionary of American English*, edited by Sir William Craigie, James R. Hulbert and a staff of expert research men was increased by parts iv, v, and vi, bringing the work to "dew." Part v completed Vol. I of the work. See PHOTOGRAPHY.

The libraries added approximately 39,000 bound volumes, raising the total to 1,271,296. The outstanding accession of the period was the Salmon O. Levinson Collection of International Peace Papers, numbering about 50,000 pieces, and containing the best existent documentation of the Pact of Paris (1928). President, Robert M. Hutchins, Ph.D.

CHICKENS. See POULTRY.

CHILD LABOR. See CHILDREN'S BUREAU; LABOR CONDITIONS; LABOR LEGISLATION; SUPREME COURT.

CHILD PSYCHOLOGY. See PSYCHOLOGY.

CHILDREN'S BUREAU. The Children's Bureau, U.S. Department of Labor, established in 1912 to carry on research and provide information and advisory service on all phases of child life in the United States, was authorized by the Social Security Act (1935) to administer three programs for grants to States for maternal and child-welfare services and was designated the Federal agency for the administration of the child-labor provisions of the Fair Labor Standards Act of 1938.

Under the Social Security Act Amendments of 1939 the annual authorization for Federal grants to the States for maternal and child-health services was increased from \$3,800,000 to \$5,820,000; for crippled children services, from \$2,850,000 to \$3,870,000; and for child-welfare services, from \$1,500,000 to \$1,510,000. Under each of the three programs, Puerto Rico was made eligible for grants beginning Jan. 1, 1940.

For maternal and child-health services Federal payments totaling \$3,724,362 were made to the public-health agencies of the 48 States, the District of Columbia, Alaska, and Hawaii on the basis of State plans approved by the Children's Bureau during the fiscal year ended June 30, 1939. With the assistance of Federal funds and consultation service from the Children's Bureau, the State health agencies extended maternal and child-health services, especially in rural areas, through the employment of physicians to give health supervisory service to mothers and children at prenatal and child-health conferences and through the provision of public-health nursing service at the clinic, in the home, and at school. The quality of maternal and child-health care was improved through postgraduate courses for physicians and other professional workers and through the employment of specialized consultants on the staffs of State bureaus of maternal and child health to give supervisory service to local public-health personnel and to give consultation

service to practicing physicians and other professional workers. In limited areas maternal and child-health funds were used to provide public-health nurses to give home-delivery nursing care on the request of practicing physicians. The increased funds for grants to the States for this program (\$2,020,000) are to be used for extension of service and for undertaking in selected areas medical care services for mothers and children.

The Children's Bureau continued during 1939 its effort to bring to the attention of the public the opportunity to prevent the unnecessary deaths of mothers and babies. The United States Bureau of the Census reported for the year 1938 the lowest maternal and infant mortality rates on record for the United States: 44 deaths of mothers per 10,000 live births and 51 deaths of infants under one year of age per 1000 live births. The President proclaimed May 1, 1939, Child Health Day. State health agencies took the lead in organizing Child Health Day activities using the slogan announced by the Children's Bureau, "The Health of the Child is the Power of the Nation."

Studies of the causes of stillbirths and of maternal and infant mortality, and of methods to promote the growth, development, and health of children were continued by the Children's Bureau. A study on medical services provided for children in a selected group of communities was begun. A new publication *Well-Nourished Children*, and revised editions of several bulletins and folders on maternal and child care were issued. Approximately 1,700,000 popular publications on child care and training were distributed during the fiscal year ended June 30, 1939.

For crippled children's services, Federal payments totaling \$2,997,914 were made to the State crippled children's agencies under State plans approved by the Children's Bureau during the year ended June 30, 1939. With the approval of the Louisiana plan in March 1939, the crippled children's program became operative in all 48 States, the District of Columbia, Alaska, and Hawaii. The additional amount (\$1,000,000) authorized for Federal grants hereafter for which matching with State funds is not required will enable more funds to be given each year to certain States heretofore unable to match in full the Federal grants. On Sept. 30, 1939, 237,000 crippled children were on the registers of the State crippled children's agencies and the number is steadily increasing.

For child-welfare services, Federal payments to the State public-welfare agencies totaling \$1,520,893 were made on the basis of State plans approved by the Children's Bureau during the fiscal year ended June 30, 1939. With the approval of the Wyoming plan in December 1939, the program for child-welfare services became operative in all 48 States, the District of Columbia, Alaska, and Hawaii. Under the administration of State welfare agencies a total of 585 full-time professional child-welfare workers were employed with Federal, State, and local funds during the fiscal year. Most of the services rendered by child-welfare workers are given to children in their own homes through aiding parents to deal with the physical, mental, social, and economic problems that threaten the well-being of their children.

The Children's Bureau, in relation to studies of social conditions affecting children, worked during 1939 with private and public agencies on

standards of care given children in institutions and agencies, on problems involved in child adoption, and in the protection of unmarried mothers and their children, on the development of housekeeper services, on the changing relationship of juvenile courts to community welfare agencies with growing responsibilities for children, and on the programs of State training schools for maladjusted children. The legislative sessions that occurred in most of the States in 1939 brought many requests to the Children's Bureau for advice on proposed legislation. Several States passed legislation improving their protection of children. Community Service for Children in St. Paul, Minn., a co-operative project undertaken by the Children's Bureau and community agencies to find methods of preventing juvenile delinquency before court procedure is resorted to, reached a stage of full operation during the year.

A report, *The Community Welfare Picture in 29 Urban Areas, 1938*, issued by the Children's Bureau in 1939 indicated that the year 1938 established a high mark in urban welfare expenditures (\$637,000,000 or \$44.01 per capita in the 29 areas covered). The study showed 72 per cent of all expenditures going for family welfare and general dependency (including aid to dependent children), 17 per cent for hospital inpatient service, less than 4 per cent each for care of children, leisure-time activities, and health services other than hospital care, and less than 1 per cent for the work of private planning and fund-raising organizations. Public agencies expended 83 per cent of the funds spent and private agencies 17 per cent.

During 1939, the Children's Bureau in administering the child-labor provisions of the Fair Labor Standards Act of 1938, developed co-operative relationships with State labor departments and other State and local agencies issuing employment certificates for children going to work. The Fair Labor Standards Act in effect establishes a basic minimum age of 16 for employment in industries producing goods for shipment in interstate commerce and of 18 for occupations in such industries found and declared by the Chief of the Children's Bureau to be particularly hazardous or detrimental to their health and well-being. The Children's Bureau by the close of 1939 had designated all but seven States as States in which a State employment certificate in the hands of an employer would be accepted as proof of age under the Federal Act. To make this possible many of the States strengthened the administration of their laws for the issuance of employment certificates and extended the issuance of such certificates to cover boys and girls of 16 and 17 years of age.

The Act provides also that outside the field of manufacturing and mining occupations children 14 and 15 years of age in industries subject to the Act may be employed in occupations under conditions determined by the Chief of the Children's Bureau not to interfere with schooling, health or well-being. A regulation issued by the Chief of the Bureau, after investigation and a public hearing, specifies the conditions under which such minors may be employed, excluding them entirely from manufacturing, mining, and processing occupations, from work on power-driven machinery or hoisting apparatus, from the operation of motor vehicles or as helpers on such vehicles, from public messenger service, and from

occupations found and declared by the Chief of the Children's Bureau to be particularly hazardous for minors between 16 and 18 years of age. In other occupations which may be subject to the Act, employment outside of school hours is permitted at 14 years, subject to specified maximum-hour and night-work regulations.

On May 18, 1939, the Chief of the Children's Bureau after preliminary investigation and public hearing issued the first order as authorized by the Fair Labor Standards Act of 1938 relating to occupations hazardous for the employment of minors between 16 and 18 years of age. The order declared hazardous for the employment of minors between the ages of 16 and 18 years of age all occupations in or about any plant manufacturing explosives or articles containing explosive components. A second order issued Nov. 27, 1939, declared the occupations of motor-vehicle driver and helper to be particularly hazardous for persons of these ages. These orders in effect exclude minors between 16 and 18 years of age from these occupations in or about establishments producing goods for shipment in interstate commerce.

Children's Bureau research in the field of child labor includes the study of conditions under which children are employed in intrastate industries not covered by the Fair Labor Standards Act as well as studies essential for administration of the child-labor provisions of the Act. During 1939 many State agencies called upon the Bureau for information and advice on child-labor legislation and its administration and many States passed legislation raising the standards in their State child-labor laws in one or more particulars.

KATHARINE F. LENROOT.

CHILD WELFARE. On Apr. 26, 1939, the first session of the White House Conference on Children in a Democracy was held in Washington. The Secretary of Labor, chairman of the Conference, at the direction of the President, appointed as members of the Conference approximately 600 men and women representing all States and a wide range of interests, including workers in various fields of child-welfare, members of civic groups and of labor and farm organizations, and officials of public and private child-welfare agencies. At the second session of the Conference, to be held Jan. 18-20, 1940, a series of reports prepared by Conference committees were to be considered, outlining child-welfare advances in the United States during the past 10 years, analyzing present conditions as they affect children, and proposing objectives to be sought in the next 10 years. The President is honorary chairman and Katharine F. Lenroot, Chief of the Children's Bureau, executive secretary. The Conference is the fourth in a series of child-welfare conferences called under Presidential auspices at intervals of approximately 10 years. The other conferences were held in 1909, 1919, and 1930.

For other developments in this field, see CHILDREN'S BUREAU.

CHILE. A South American republic. Capital, Santiago.

Area and Population. Area, 286,396 square miles; population, estimated at 4,634,839 on Dec. 31, 1938 (4,287,445 at 1930 census). Among the 105,463 aliens residing in Chile in 1930 were 23,439 Spaniards, 11,070 Italians, and 10,861 Germans. In 1938 48,221 passengers entered Chile and

44,751 departed. Living births registered in 1938 numbered 154,918 (33.6 per 1000); deaths, 113,723 (24.6); marriages, about 37,487 (8.1). The population is predominantly European (chiefly Spanish) in origin, but there is a considerable Indian strain in the lower classes. Populations of the chief cities (1930): Santiago, 696,231; Valparaíso, 193,205; Concepción, 77,589; Antofagasta, 53,591; Viña del Mar, 49,488; Iquique, 46,458; Talca, 45,020.

Defense. All young men of 20 are conscripted, mostly for one and a half years, and then serve in the reserve until their 45th year. The active peace-time army totals about 30,000 officers and men; air force (1938), 210 airplanes; navy, 1 battleship, 1 coast defense vessel, 3 cruisers, 8 destroyers, 9 submarines, and various auxiliary vessels, with a complement of about 8000 officers and men.

Education and Religion. Education is compulsory for children of 7 to 15 years, but about 75 per cent of the adult population is estimated to be illiterate. Educational statistics for 1937 were: Primary, 4663 schools, 587,108 pupils; secondary, 235 schools, 44,199 pupils; normal, 10 schools, 1597 pupils; commercial, 24 schools, 3054 pupils; special, 153 schools, 31,655 pupils; universities, 4 with 6270 students. The Roman Catholic religion, formerly maintained as the state church, was disestablished in 1925.

Production. At the 1930 census 37.8 per cent of the working population was engaged in agriculture and 22.1 per cent in industry, including mining. Yields of the chief crops in 1937-38 were (in metric tons): Wheat, 824,300; barley, 163,800; oats, 120,400; corn, 56,200; potatoes, 437,400; wine, about 4,000,000 hectoliters (hectoliter equals 26.42 U.S. gal.). Wool production in 1937 was about 16,200 metric tons. Mineral output in 1938 was (in metric tons): Nitrate, 1,405,200 (1,437,500 in 1937); copper ore (metal content), 351,400; iron ore (metal content), 950,000; coal, 2,061,000. Gold production (in fine kilograms) was 9144; silver, 43,984. The nitrate industry employed an average of 20,147 miners in 1938.

Wages paid by manufacturing industries in 1938 totaled 1,716,000,000 pesos (1,522,800,000 in 1937). Manufacturing production included: Cement, 8,564,000 bags (of 42.5 kilos); coke, 79,368,000 kilos; knitting wool, 447,000 kilos; cloth, 3,330,000 meters; refined sugar, 126,160,000 kilos; beer, 61,987,000 liters.

Foreign Trade. Imports in 1938 totaled \$103,466,000 (\$88,389,000 in 1937); exports, \$140,607,000 (\$195,298,000). Conversions from gold pesos to dollars were made at \$0.2061 for both years. The United States supplied 27.7 per cent of the imports (29.1 in 1937); Germany 25.7 (26.0); United Kingdom, 10.6 (10.9). The United Kingdom took 21.8 per cent of the 1938 exports (19.6 in 1937); United States, 15.8 (22.5); Germany, 10.0 (9.5). Values of chief 1938 exports (in 1000 gold pesos): Copper bars, 328,818; nitrate, 141,557; wool, 25,346.

Finance. Actual governmental revenues in 1938 were 1,635,000,000 pesos; ordinary expenditures, 1,664,000,000 pesos. Budget estimates for 1939 were: Revenues, 1,666,872,000 pesos; expenditures, 1,666,867,000. The accumulated budget surplus as of Dec. 31, 1938, was 14,940,000 pesos. The public debt on Dec. 31, 1938, was divided as follows: Internal (in Chilean pesos), 1,851,732,768; external (in U.S. dollars), 382,151,098. Exchange rates of the paper peso in 1938 were: Official,

\$0.05162 (\$0.05162 in 1937); export, \$0.04004 (\$0.03987); free, \$0.03684 (\$0.03831).

Transportation. Chile in 1938 had about 5450 miles of railway lines, of which 1815 miles were privately-owned. All lines (1938) carried 20,220,000 passengers and 10,036,400 metric tons of freight. The State lines took over operation of the Iquique-La Noria Railway Sept. 11, 1939, from private control. Highways in 1939 extended 22,613 miles (see **ROADS AND STREETS**). Domestic airlines in 1938 reported 601,106 kilometers flown, 3711 passengers, 8310 kilos of mail and 20,436 kilos of freight carried (kilo equals 2.2 lb.). The tonnage of vessels entering the ports with cargo and in ballast in 1938 was 2,724,000; tonnage cleared, 2,700,000.

Government. By the Constitution of Oct. 18, 1925, executive power is vested in a President, aided by a cabinet responsible to him. Legislation is the function of the National Congress, consisting of a Senate of 45 members elected for 8 years and renewed by halves every 4 years, and a Chamber of Deputies of 146 members elected for 4 years by departments. The President, chosen for 6 years by direct popular vote, is ineligible to succeed himself. Pedro Aguirre Cerda (Radical) was elected President by a Popular Front coalition of the Radical, Socialist, Radical Socialist, Democratic, and Communist parties on Oct. 25, 1938, and assumed office Dec. 24, 1938.

HISTORY

President Aguirre Cerda's Popular Front regime, assuming office in December of 1938 with a pledge to "end conditions in which the Chilean masses lack food, culture, clothes, and dwellings," faced unexpected difficulties in carrying out its programme during 1939. On the night of January 24 the most disastrous earthquake in Chilean history wrecked cities, towns, and farm dwellings throughout six of the richest agricultural provinces in central Chile. The quake razed virtually every building in Chillán, a city of nearly 50,000, and ruined Concepción, Parral, San Carlos, Yungay, Talca, Talcahuano, and a score of additional towns and cities. It spread damage as far north as Santiago and southward to Valdivia. Railways and highways were rendered unsafe, water systems and other public utilities disrupted, and the entire economic life of the region paralyzed. Nearly 50,000 persons were killed and 700,000 made homeless. Property damage was estimated at \$30,000,000 to \$50,000,000. See **EARTHQUAKES**.

A second major setback to Chile's economic prosperity came with the outbreak of the European war in September. This virtually eliminated trade with Germany, curtailed export markets, and caused an increase of prices in imported necessities. The Popular Front regime had to contend, in addition, with vigorous opposition to its programme from the Rightist majorities in the Senate and Chamber of Deputies, and with sporadic revolts and conspiracies by discontented army officers and politicians. The menace of civil war, which appeared perilously near during the latter part of 1938, hung over all political discussions during 1939.

Popular Front Programme. Previous to the earthquake, the President and his cabinet worked at full speed upon a far-reaching programme for increasing national production and improving the status of the masses, largely at the expense of the wealthy land-owning class that had ruled Chile since the proclamation of its independence. The

government services, defense forces, rural police and the various public administrative agencies were reorganized and purged of Rightists holding key positions. Effective measures were taken to reduce the price of flour, wheat, bread, meat, vegetables, cement, and other construction materials. Pawned tools and machinery by which the poor earned their living were returned to the owners without cost. A nation-wide programme of highways, public housing, and electric power projects was begun. Reorganization of the educational system was undertaken with the aim of reducing illiteracy, abolishing religious influences and teaching industrial and commercial rather than professional skills.

The political appeal of this programme was demonstrated in elections held to fill three vacant places in the Chamber of Deputies on January 23. Socialist candidates, supported by the Popular Front groups, overwhelmingly defeated their Rightist opponents. The earthquake of the following day produced a short political truce. But the battle between the forces of Left and Right was resumed with renewed intensity when the government decided to link its plans for the systematic development of national production with an equally ambitious programme for reconstruction of the devastated regions.

President Aguirre Cerda asked Congress on January 31 to authorize loans totaling $2\frac{1}{2}$ billion paper pesos to finance both programmes. The enabling bill called for sharp increases in income, inheritance and other taxes, a 10 per cent extraordinary tax on the income of large American-owned and other mining concerns, and higher license fees for certain manufacturers, concessionaires, merchants, and on mining claims covering borax and its compounds. The Rightist Deputies and Senators in general approved the government plans for repair of earthquake damage. But they strenuously opposed linking them with the equally costly production development programme. There were weeks of bitter debate on the various provisions of the bill, marked by great demonstrations of Popular Front supporters against the Rightist majority in Congress. When the measure reached the President it was so altered that he vetoed portions of it. On April 27, under strong pressure from the government and the Popular Front movement, Congress finally accepted the modifications demanded by President Aguirre Cerda.

Reconstruction-Production Law. The law as promulgated April 28 provided for the creation of two fiscal corporations—the Reconstruction and Relief Corporation and the Corporation for the Promotion of Production, each with a board of 24 directors, headed by the Secretary of the Treasury, and an executive vice chairman elected by the directors.

The President was authorized to raise loans in foreign currency up to 2,000,000,000 paper pesos (about \$80,000,000), to be equally divided between the two corporations. He was also empowered to contract internal loans up to 500,000,000 pesos (\$20,000,000) for the construction of low-cost housing, particularly in the devastated region. Pending flotation of foreign loans, the President was authorized to use funds set aside for service of the foreign debt.

The Reconstruction and Relief Corporation was granted wide powers over loans, expropriations, reconstruction, and every form of aid to the earthquake-shattered districts. Its existence was limited

to six years. The Corporation for Promotion of Production was made a permanent institution. The government sought wide legislative and executive powers for this corporation, but due to Rightist opposition the law restricted its authority to proposing legislation and executing the laws enacted for that purpose by Congress. The Corporation was placed in full charge of the 500,000,000-peso housing project.

The government made soundings regarding a large loan in the United States but succeeded only in obtaining a \$5,000,000 credit from the Export-Import Bank of Washington, to be repaid over an eight-year period with interest at 4 per cent annually. The Minister of Finance announced on August 8 that the bulk of the funds for carrying forward the work of the two corporations would be obtained from internal sources, as follows: Extraordinary taxes, 1,000,000,000 pesos; advances against loans, 500,000,000 pesos; banking loans, 500,000,000 pesos. The extraordinary taxes were exacted largely from copper exports and other levies on foreign-controlled mining enterprises. With funds from these sources rapid progress was made in providing relief and emergency shelters for the population of the earthquake districts, starting permanent reconstruction of towns and cities with shock-resistant materials, and initiating the public works and other projects designed to increase national productivity and the standard of living.

Many of these projects carried a step further the policy of establishing greater state control over foreign-owned economic enterprises of all kinds. It was announced on May 30 that a government monopoly of the distribution and sale of petroleum products would be established September 3.

Political Dissensions. Opposition attacks upon the government grew more intense following the passage of the Reconstruction and Promotion Law. On May 27 the Chamber of Deputies forced the resignation of Minister of Interior Pedro Alfonso for confiscating copies of the Conservative party's organ containing "biased and unfair" attacks against the government. The President strongly upheld the action of his Minister and Señor Alfonso was reinstated on June 22 when the Senate failed by a narrow margin to support the Rightist charges against him.

The agitation for violent overthrow of the government was actively supported by Nazi elements among the German-speaking population and by the Chilean branch of the Spanish Fascist movement. The government deported several leading Germans charged with Nazi propaganda and took steps to curb Nazi-Fascist penetration of the educational system. On July 9, 30 former army and rural police officers were arrested for plotting against the government. Some of them admitted connections with the Spanish Fascists. Investigation of the conspiracy led to the arrest on July 18 of the director of the School of Military Engineering. It was charged that supporters of former President Carlos Ibáñez del Campo were involved in a wide-spread movement among the defeated Rightist groups.

The arrest and subsequent dismissal from the army of the Engineering School head was made the subject of violent debate in Congress, with Rightists seeking the resignation of the Minister of War. The controversy was interrupted by another abortive revolt on August 25, led by former President Ibáñez del Campo and Gen. Ariosto

Herrera. This movement, which apparently had wide support among army officers, was discovered and broken up by the government without bloodshed. A state of siege was proclaimed and the government obtained emergency powers to deal with the crisis. General Ibáñez escaped to the Paraguayan Legation and subsequently to Argentina, but General Herrera and 65 other officers and civilians were arrested. Military courts subsequently exiled General Herrera and 40 other officers to other South American countries, while many civilians, including former military men, were ordered to reside in small villages in northern Chile.

The military revolt was denounced by many Rightist members of Congress, but it spurred extremist elements in the Popular Front to demand more radical measures of both an economic and political character. The President resisted these demands. His government took steps to distribute in various parts of the country several thousand Spanish Republican refugees and some hundreds of German and Austrian Jews who were offered new homes in Chile. This lessened the danger of their becoming a political problem. He also declared a policy of strict neutrality in the European war, taking rigorous measures to check price rises and profiteering. On September 9 the government acted through the Exchange Control Commission and the Commissariat of Prices to curb speculation. Scores of business houses were closed or fined for increasing prices and unduly restricting sales. Yet shortages in coal and other imports developed and prices increased, thus obstructing the government's programme for raising the standard of living.

The country's largest textile mill was closed by labor trouble November 20. On December 4 a Leftist crowd attacked ex-President Alessandri and his son when they landed at Antofagasta. Economic and financial conditions became more difficult and the Leftist press accused Rightists of sabotaging the government's rehabilitation program. On December 26 Finance Minister Roberto Wachsoltz resigned from the government because of unspecified "difficulties."

Foreign Relations. The Popular Front Government did not allow its Leftist sympathies to interfere with Chile's important barter trade with Nazi Germany. At the same time it strove to develop commercial relations with all of the American nations. A barter agreement with Brazil was made in July. The economic and cultural agreements negotiated with Bolivia in 1938 (see 1938 YEAR BOOK, p. 97) were ratified by Congress on August 24. A plan for making Arica a free port, with the hope that it would become a more important commercial centre for the trade of Bolivia, Peru, Chile, and northern Argentina found substantial support in the Chilean Congress and government.

After the European war began, there was an important shift of Chilean trade from Germany to the United States. The \$5,000,000 loan obtained at Washington aided this trend, and on October 2 Secretary Hull announced the U.S. Government's intention of negotiating a reciprocal trade treaty with Chile. A number of Chilean army, air, and naval officers were sent to the United States during the year to take courses of instruction in various defense units. Late in the year a Chilean military commission visited the United States to make artillery and other armament purchases. On November 10 it was announced that a U.S. army

air mission would be sent to Chile to instruct the air force.

The friendship of the other American republics was strikingly demonstrated by the immediate and generous aid sent to Chile from many parts of the hemisphere upon news of the earthquake of January 24. Aid from Argentina was the first to arrive, and this circumstance added to the great enthusiasm with which Chile joined on May 25 in celebrating the 129th anniversary of Argentine independence. In August Argentina took the lead in forming a bloc of South American nations that supported Chile in its dispute with the Franco Government in Spain over the right of the Chilean Legation in Madrid to harbor Spanish Loyalists who sought refuge there upon the surrender of the capital. Franco finally agreed on October 15 to allow four former Loyalist officials to leave the Legation and take refuge abroad. Thirteen others remained under Chilean protection.

Possibly due to the influence of its Communist supporters, the government in December refused to join in an inter-American protest against the Russian attack upon Finland.

* Where more than one name is given for the respective capitals in parentheses, they represent the official name, postal map name, and popular or ancient name, in the order given. ^b Chahar, Ningsia, and Suiyuan Provinces, together with part of Jehol, form the geographical region known as Inner Mongolia. ^c The Provinces of Heilungkiang, Kirin, and Liaoning constitute the geographical region known as Manchuria, which on Feb. 18, 1932, was proclaimed the free state of Manchoukuo. Jehol Province was incorporated in Manchoukuo in 1933. ^d Dependencies. ^e The Mongol name for Urga has been changed to Ulan Bator Khoto.

cised little or no actual control, and the former Chinese Provinces incorporated in the Japanese protectorate of Manchoukuo (q.v.), China has an area estimated by the Ministry of the Interior in 1937 at 4,516,934 square miles and a total population of 466,785,856. Official 1937 estimates of the area and population by Provinces are shown in the table on preceding page.

As no census has been taken in modern times, the above figures are merely rough estimates. Including the nominal dependencies, the area is roughly equal to that of the United States and Mexico combined, while the population is approximately one-fourth of the world's total. In addition there were estimated to be 7,828,888 Chinese residing abroad in 1936. The Japanese civilian population of North China was reported at 177,000 on Oct. 31, 1939, having increased by an average of 7000 monthly during the first 10 months of the year. The estimated population of Shanghai and its environs in 1936 was 3,489,998 including 1,450,685 persons in the Foreign Settlements; of Peiping, capital of China until 1928, 1,556,364; of Tientsin, 1,292,025; of Nanking, 1,019,948; of Tsingtao, 514,769. Estimated populations of the other chief cities in 1931 were: Canton, 861,024; Hankow (including Wuchang and Hanyang), 777,993; Chungking, 635,000; Wenchow, 631,276; Changsha, 606,972; Hangchow, 506,930; Weihaiwei, 390,337; Foochow, 322,725; Soochow, 260,000; Amoy, 234,159; Ningpo, 218,774; Wanhhsien, 201,937; Chinkiang, 199,776.

Education and Religion. Between 25 and 50 per cent of the population were estimated to be literate in 1937, compared with an estimated 15 per cent in 1912. In 1935 there were 16,000,000 children in primary schools, of whom 12,383,479 were in 259,095 regular schools and the rest in one-year primary schools. For secondary education, there were in 1934-35, 3140 schools of all kinds, with 541,479 students. There were 107 institutions of higher learning in 1937 and 41,768 students attending them in 1935 (6200 women).

With the exception of Christians and Mohammedans, most Chinese practise and profess all three indigenous or adopted religions—Confucianism, Buddhism, and Taoism. The Mohammedans are estimated at about 20,000,000. In 1934 there were 2,623,560 native Roman Catholics and 123 Catholic missions, with a staff of 16,241. The Protestant churches, with 1130 mission stations and 488,539 communicants in 1932, had 19 colleges, 267 middle schools, and 37,714 students in 1934.

Production. Previous to the outbreak of the Chino-Japanese War in 1937, China was the world's leading producer of rice, soybeans, tea, kaoliang, sweet potatoes, millet, and vegetable oils; it ranked second in the output of raw silk and wheat; third in cotton, and was an important producer of corn, tobacco, fruits and vegetables, and cane sugar, as well as the leading exporter of eggs and tung oil. Estimated production of wheat in 1939 was 640,000,000 bu.; cotton, about 1,800,000 bales (of 500 lb. each). Production of other crops, in metric tons, was: Rice, 48,014,900 in 1936-37; barley, 6,371,000 in 1937; oats, 852,500 in 1937; corn, 6,130,100 in 1936; tobacco, 633,700 in 1936; cotton-seed, 1,630,000 in 1937; linseed, 12,200 in 1937 (exports); rape-seed, 2,478,600 in 1936; sesamum, 865,000 in 1936; ground-nuts, 2,631,100 in 1936; soybeans, 5,911,000 in 1936.

Tea production is estimated at from 300,000 to 500,000 metric tons (exports in 1938, 41,600 metric tons). Raw silk exports, including Manchuria, were 3950 metric tons in 1938; wool production, 55,000 metric tons in 1937.

China is normally one of the world's principal producers of antimony, tin, tungsten, and manganese. It produces substantial quantities of coal, oil, fluorite, mercury, galena, gold, silver, and many other metals. For 1936 mineral production, see 1937 YEAR BOOK. The war caused a sharp curtailment of production during 1937-39. The metal content of leading minerals produced was (in metric tons): Manganese ore, 600 in 1937 (exports); iron ore, 250,000 in 1937 (exports); tin ore, 900 in 1938; tungsten ore, 7415 in 1938 (exports); antimony ore, 15,200 in 1937. China's rapidly growing industries (see 1937 YEAR BOOK, p. 152) suffered a severe setback as a result of the war, but a marked development of manufacturing in the western provinces resulted.

Foreign Trade. Merchandise imports in 1938 were valued at 886,199,569 yuan (Chinese standard dollars); exports, 762,641,058 yuan. In old U.S. gold dollars, the figures were: Imports, \$154,200,000 in 1938 (\$165,100,000 in 1937); exports, \$90,600,000 (\$145,100,000). In 1938 Japan supplied 28.76 per cent of the recorded imports (18.12 per cent in 1936); United States and Philippines combined, 17.32 (20.07 in 1936). Of the recorded exports, the Japanese Empire took 21.71 per cent in 1938 (19 in 1936); United States and Philippines, 19.6 (30 in 1936). See IMPORTS AND EXPORTS.

Finance. Budget estimates of the National Government at Chungking totaled 2,400,000,000 yuan for 1938 and 2,800,000,000 yuan for 1939. Actual budgetary returns since the outbreak of the Chino-Japanese war in 1937 were not available. The National Government's total debt as of Dec. 31, 1935, was officially estimated at 5,794,655,187 yuan. Between the outbreak of war in July, 1937, and November, 1939, war loans totaling an additional 2,800,000,000 yuan were issued. Credits were also obtained from the United States (\$25,000,000 U.S. in December, 1938); Great Britain (£5,000,000 in March, 1939); and the Soviet Union. Interest on the foreign debt was suspended in January, 1939, and in March interest on salt-secured loans was also suspended, due to Japanese seizures of customs, salt and other revenues pledged for the loan service. However the Chungking Government announced that it was setting aside in the Central Bank of China a share of the long-term debt service, in Chinese currency. The government's monetary gold reserves were reported at the equivalent of 12,000,000 old U.S. gold dollars on Sept. 30, 1939. Between June 30, 1937, and June 30, 1939, the note issue of government and state-guaranteed banks increased from 1,643,000,000 to 2,866,000,000 yuan, partly due to the substitution of notes for silver coins and the purchase of gold. The yuan, or Chinese standard dollar, exchanged at an average of \$0.2961 in 1937, \$0.2136 in 1938 and \$0.1188 in 1939. In the summer of 1939 it declined to a new level of U.S. \$0.08.

The North China provisional government at Peiping announced that its revenues in 1938 totaled 132,000,000 "Federal Reserve Bank" yuan (73,000,000 from customs) and expenditures 53,000,000 yuan (1 yuan equals 1 Japanese yen). See *History* for further details.

Railways. Reconstruction and extension of

transportation and communication facilities was extremely active in both the Japanese-dominated and Chinese-held regions during 1939. At the end of July, 1939, the Japanese were reported to be in control of 4546 miles of railways while about 2285 miles were held by the Chinese. Despite activities of Chinese guerrillas, the Japanese made progress in repairing and reopening railways captured from the Chinese. Operations on many of the important lines were restricted to military traffic. Conversion by the Japanese of the 148-mile Shihchiachwang-Taiyuan railway in Shansi Province from narrow-gauge to standard-gauge was completed late in September.

The Chinese rushed new railway and highway projects to replace those lost to the advancing Japanese and to maintain the flow of foreign munitions and supplies. With the Japanese drive on Nanning, the Chinese abandoned the work of extending the Hunan-Kwangsi Railway from Kweilin to Nanning, making Liuchow the terminus. Work on two railways, connecting Kunming with the Burma railway network and with Suifu on the upper Yangtze in Szechwan, started late in 1938 and were continued throughout 1939. On Jan. 24, 1939, the British and Chinese governments signed an agreement for railway and air passenger services between Yunnan Province and Burma.

Highways. Highway mileage in all China was estimated at 61,430 in 1937. During 1937-39 the National Government and subordinate provincial authorities constructed over 10,000 miles of additional roads, while the Japanese reported adding 8700 miles of public motor roads to the 15,161 miles in operation in North China at the time of the Japanese conquest. The Chungking Government opened to traffic late in 1938 the 650-mile highway connecting Kunming with the Rangoon-Lashio railway and road system in Burma. This gave all western and southwestern China an outlet to the sea through neutral territory. A bus service over this road was opened at the end of July, 1939, and American trucking experts were engaged to organize the service of supply. In the late summer heavy rains temporarily interrupted traffic on this highway. To supply Nationalist armies in northwest China, another truck road was constructed through Lanchow to Sinsinchia on the Kansu-Sinkiang border, from which point imports and exports were relayed to the Soviet border. A third new outlet to foreign munitions supplies was sought through the construction of a highway from Chungking westward to Tachien-lu near the Tibet border in Sikang Province, completed late in 1939. From there Chinese authorities planned to extend it with Tibetan and British-Indian co-operation across Tibet and southward to Calcutta. Numerous minor highway projects were under construction. See **ROADS AND STREETS**.

Air Services, etc. After the fall of Hankow in October, 1938, air services in Nationalist China were restricted to routes between the West China cities and Hong Kong and Hanoi, French Indo-China. Under the Anglo-Chinese air agreement of Jan. 24, 1939, Kunming became a port of call on the Rangoon-Hong Kong extension of the Imperial Airways trunk line from London. Mail and passenger service between Chungking and Haiphong, French Indo-China, was started Mar. 15, 1939, via Kunming and Hanoi. In September the China National Aviation Corporation (Sino-American) was instructed by the

Ministry of Communications to take over services previously operated by the Sino-German Eurasia Aviation Corporation between interior cities and Hanoi and Hong Kong. On October 30 the same company inaugurated a Chungking-Kunming-Rangoon mail and passenger service. A Sino-Soviet mail and passenger service was opened between Chungking and Moscow on December 5. Japanese air lines connecting the chief Japanese cities with Shanghai, Nanking, Tsingtao, Tientsin, and Peiping were opened during 1937 and 1938. Among the new Japanese-operated lines opened in 1939 were: Peiping-Dairen; Peiping-Shanghai via Tientsin, Tsinan, Hsuechow and Nanking; Peiping-Tatung via Kalgan.

Hong Kong-Chungking and Hong Kong-Manila radio-telephone services were formally inaugurated Aug. 15, 1939.

Government. The Nationalist Government at the beginning of 1939 represented a Kuomintang (Nationalist party) dictatorship. The Organic Law of Oct. 4, 1928, revised on Dec. 29, 1931, and Dec. 27, 1932, vested supreme power in the National Congress of the Kuomintang, acting through the Central Executive Committee, the Central Supervisory Committee, and the Central Political Council. Executive control, however, rested mainly in the hands of Gen. Chiang Kai-shek, commander-in-chief of the Nationalist armies. Pending the projected establishment of representative government, governmental functions were carried on by means of a committee system (for description, see 1932 YEAR BOOK). The chairman of the State Council and nominal head of the government was Lin Sen. The chairmen of the five yuan (committees) of the government were: Executive, Dr. H. H. Kung; Legislative, Sun Fo; Judicial, Chu Cheng; Examination, Tai Chi-tao; Control, Yu Yu-jen. Assisting Dr. Kung in the executive branch were nine ministries, headed as follows after the cabinet reorganization of Jan. 2, 1938: Interior, Gen. Ho Chien; Foreign Affairs, Dr. Wang Chung-hui; Military Affairs, Gen. Ho Ying-chin; Finance, Dr. Kung; National Economy, Dr. Oong Wen-hao; Railways and Communications, Dr. Chang Chia-ngau; Education, Chen Li-fu. The Ministry of Judicial Administration, headed by Hsieh Kuan-sheng, was subordinate to the Judicial Yuan. For developments in 1939, see *History*.

HISTORY

Progress of War. The Japanese effort to subjugate China by force of arms, which began in July, 1937, was pushed relentlessly throughout 1939, but with few of the sensational gains registered by Japanese armies in the preceding years. The territories occupied by the Nipponese at the close of 1938 (see map in 1938 YEAR BOOK, p. 152) were only slightly enlarged by the end of 1939. Successful drives on Nanchang and Nanning, occupation of the port of Swatow and of the Island of Hainan, and the tightening of the blockade along the entire seacoast represented the major Japanese accomplishments of the year in the military sphere. The fall of Nanning, cutting the highway over which the Chinese received a large proportion of their munitions and supplies, was a particularly severe blow.

These Japanese gains were offset by unprecedented defeats inflicted upon large Japanese forces by the Chinese, notably in repulsing a major

offensive against Changsha. Japanese drives up the Han valley from Hankow, along the Peiping-Hankow railway from Hankow, and against Chinese forces in Shansi Province were likewise broken by stubborn Chinese resistance. The invaders failed also in repeated efforts to end the widespread and well-organized Chinese guerrilla warfare throughout most of the territories under nominal Japanese control. The Japanese made discouragingly slow progress in the economic exploitation of their conquest and in their persistent efforts to establish a central Chinese puppet regime that would draw support away from the Chungking Government.

The end of 1939 found the Chinese seemingly more united than ever under Gen. Chiang Kai-shek's leadership, except for the growing breach between Communist and anti-Communist elements. They had fought the Japanese armies everywhere to a standstill, were waging numerous counter-offensives against the various Japanese fronts, and maintained military and political control over large areas in the rear of the Japanese armies. Chiang Kai-shek's forces, estimated at more than 2,000,000 men including guerrillas and bandits, appeared willing and able to continue the war indefinitely. On the other hand, the progressive curtailment of imports of foreign heavy arms and munitions as a result of the Japanese advances made it improbable that the Chinese could expel the invaders from the bulk of the occupied territory. The conflict had settled down to a war of endurance in which Chinese manpower was matched against Japanese economic resources.

War Losses. The Chinese losses had been enormous. The Japanese Imperial Headquarters placed the number of Chinese soldiers killed in battle between July, 1937, and November, 1939, at 1,218,462. A neutral estimate placed Chinese casualties to June 30, 1939, at 2,200,000 including 900,000 war dead. In addition 40,000,000 Chinese civilians had been driven from their homes and from 5,000,000 to 10,000,000 had died of disease, starvation and privation due to the war, according to a "conservative estimate" made by Rear Admiral Harry E. Yarnell, former commander of the U.S. Asiatic fleet, on Dec. 11, 1939. The Sino-Japanese war, he said, had caused "more death, destruction, misery and suffering than resulted from the great World War of 25 years ago." On September 11 foreign relief authorities in Shanghai estimated that 25,000,000 Chinese faced starvation during the coming winter as a result of drought in Shantung Province and floods in Hopeh Province and the Yellow River basin.

The Japanese were reported to have employed between 800,000 and 1,000,000 troops in China proper during 1939. Besides some 220,000 troops garrisoning cities and guarding lines of communication, there were approximately 300,000 men in the Hankow area in the spring of 1939, 200,000 in Honan, Hopei, and Western Shantung, 120,000 in Shansi, and about 60,000 in the Canton area. In addition Japan was maintaining over 300,000 troops in Manchoukuo and some 40,000 in Korea. The dispatch of an Imperial Guards division to China toward the end of 1939 was taken by the Chinese as a sign of Japan's growing shortage of trained soldiers. Neutral sources estimated Japanese casualties from July, 1937, to July, 1939, at about 330,000 killed and 470,000 wounded. An official Chinese estimate placed total Japanese casualties at 400,000 during 1939 and 350,000

during 1938. The Japanese reported their battle deaths in China proper between October, 1938, and November, 1939, at only 27,000.

Japanese Strategy. The first two years of the conflict cost Japan about five times as much as the Russo-Japanese War, used up three-fourths of the Japanese gold reserves, greatly increased the national debt and in other ways weakened Japan's military-economic strength. The Japanese dilemma grew more serious throughout 1939. If they launched further great offensives, the cost in men and money would be high, the Japanese lines of communication would be further extended, and there was no certainty that Chinese resistance would be crushed. If the Japanese stood on the defensive and attempted to consolidate their military control of the occupied regions, the Chinese would be free to train and equip additional troops in the west while concentrating their energies on guerrilla warfare behind the Japanese lines.

Early in the year the Japanese general staff adopted a middle-of-the-road policy, combining moderately ambitious offensive operations against Chiang's main armies with an intensified campaign to stamp out Chinese guerrillas. These efforts were supplemented throughout the year by systematic, large-scale, relentless air raids upon all the Chinese cities and communications centers still under Chiang's military control. In the first seven months of 1939, these raids caused 40,000 civilian casualties (20,000 deaths), according to the Chinese. In one raid on Chungking (May 4) 4572 were killed and 3637 wounded. Some 1200 raids were reported for the seven-month period and about 32,000 bombs were dropped.

At the same time the Japanese attempted to regain at least part of the cost of their conquests by organizing the economic exploitation of the occupied territories. As this effort was hamstrung by Chinese non-co-operation, the Japanese strove to establish within the conquered territories a Chinese government, pledged to economic and political co-operation with Japan, that would prove more successful than the existing discredited puppet regimes at Peiping and Nanking in attracting Chinese support.

Military Campaigns. The first successful advance of the year was the occupation by the Japanese navy on February 10 of Hainan Island, despite the Anglo-French warnings issued in 1938 (see 1938 YEAR BOOK, p. 159). Early in February Japanese armies on the Yangtze River front launched several offensives. A new, and this time successful, drive from Kiukiang southward along the railroad to Nanchang was crowned with the capture of the latter city on March 27. From Nanchang the Japanese marched westward along the Chekiang-Hunan railway, renewing the unsuccessful 1938 drive on Changsha. Another Japanese column advanced from Yochow on the Yangtze above Hankow along the Hankow-Canton railway against Changsha. But in April both of these drives stalled against the stubborn Chinese defense. In the Nanchang area, the Chinese counterattacked and inflicted a severe defeat upon the Japanese. However the latter managed to hold Nanchang.

Meanwhile large Japanese forces were advancing up the Han River valley northwest of Hankow in a drive to split off the Chinese forces in northern China from Chungking and the central front. This drive carried the Japanese by the end of May into northwest Hupeh and south-

western Honan. There a firm Chinese stand blocked a further advance and then a flanking operation turned the Japanese advance into a costly and humiliating retreat. The gains of more than a month of hard fighting were wiped out in a few days.

While these Japanese offensives were in progress, Chinese forces attacked the Japanese simultaneously on a number of other fronts—in Shansi province, near Kaifeng in Honan, at Canton and elsewhere—and intensified guerrilla activities. Strong Chinese bands harassed the Japanese around Shanghai, Nanking, Peiping, and other occupied cities, ambushing patrols and small armed forces, cutting railways and telegraph lines, and reoccupying captured towns and villages as soon as the Japanese troops had advanced to new positions.

Early in June the Japanese made another attempt to drive a wedge between central and northwestern China. This time heavily reinforced armies struck westward from central Shansi at the Eighth (Communist) Route Army and Nationalist troops under Gen. Wei Li-huang defending the mountainous western districts of the province. This was the sixth successive Japanese effort to break through this mountain barrier and capture Sian, the key point from which Soviet arms and supplies were distributed to Chinese troops in Shansi, Shensi, Honan, and Hupeh provinces. But again it failed. Some 120,000 Japanese troops, operating in several columns, were making slow and costly headway when they became bogged down in August by the heaviest rainfall recorded in North China in 80 years. Military operations throughout North China were paralyzed for a month while floods destroyed strategically important railways, great quantities of armaments and supplies, and wrecked hundreds of factories in the Japanese-occupied areas. In the Shansi mountains three Japanese columns, isolated by floods, were surrounded by Chinese forces. On August 22 the Chinese announced a decisive victory and the collapse of the Japanese drive toward Sian.

The failure of this campaign was followed by a shakeup of the Japanese high command. On September 12 all land forces in China were unified under the command of Gen. Juzo Nishio, former inspector-general of Japanese military training, with an ex-War Minister, General Itagaki, as his chief of staff. These new leaders sought to recoup the prestige lost in preceding campaigns in China and in the Soviet-Japanese fighting along the Outer Mongolian-Manchoukuo border (see MANCHOUKUO under *History*) by renewing on September 16 the pincer drive against Changsha from both Nanchang and Yochow. (A Soviet-Japanese truce was signed two days before.)

During September the Japanese advanced against strong opposition to within a few miles of Changsha. But the Chinese before retreating had made all roads and tracks impassable to the heavy Japanese mechanized equipment, which was left behind. Once they found themselves fighting the Japanese on equal terms, the Chinese launched a counteroffensive, marked by successful flank attacks on the Japanese lines of communication, that routed the Japanese and according to the Chungking Government won for the Chinese "the biggest single victory of the war." By the middle of October the Chinese had regained all the territory lost during the Japanese advance

and were once more threatening the Japanese hold on Yochow.

Meanwhile bitter fighting was continuing between smaller forces in Shansi. In the Canton area the Japanese early in October beat off a Chinese attack along the borders of the British leased territory of Kowloon on the mainland opposite Hong Kong (q.v.) and captured Shekki on the river delta on October 8.

In the last six weeks of the year the Japanese won a major victory in the extreme south of China. A large military-naval force landed near Pakhoi on November 15 and easily captured that port city in southern Kwangtung province, which had withstood an attempted landing by smaller Japanese forces in 1938. From Pakhoi an army of about 50,000 men struck inland toward Nanning in Kwangsi province. Meeting weak resistance, they succeeded in capturing that important point on November 24 and cutting the Hanoi-Nanning-Kweilin motor highway as well as the Yu River route to French Indo-China. It was estimated that over one-third of all China's imports and exports had moved over these two transport arteries previous to Nanning's capture.

From Nanning the Japanese late in December raided Nankwan on the Kwangsi-French Indo-China border, where they reported the capture of large quantities of munitions and supplies. Japanese efforts to advance northward and westward from Nanning were said to have been checked, but on December 31 the Japanese used their new Nanning base to carry out air attacks on the French-owned Indo-China-Yunnan railway, several hundred miles to the west.

Political Developments. The marked success of the Chinese armies in checking Japanese advances during the year greatly increased Chinese unity and the strength of the Chungking Government. Two hundred delegates of the Kuomintang's Central Executive Committee, meeting in Chungking in January, unanimously approved Gen. Chiang Kai-shek's plans for continuing the war. The Communists, who were not represented, also sent pledges of their continued co-operation in the struggle for independence. The committee created a Supreme National Defense Council under Chiang Kai-shek with unified military and political powers. A program was adopted for more rapid industrialization of western China to provide an economic base for military resistance to Japan.

A special session of the Supreme National Defense Council was held September 16 in Chungking coincident with a regular session of the People's Political Council, which attracted delegates from all Chinese provinces. At the same time about 40 delegates of the Chinese Industrial Cooperative Society met in the provisional capital and laid plans for adding 10,000 co-operative units during the ensuing year to the 1100 co-operatives, developed during the preceding year, which were already playing an important role in the rebuilding of the "free" provinces of China.

These meetings were a prelude to an important plenary session of the Central Executive Committee of the Kuomintang at Chungking on November 12-21. Responding to demands of both liberals and Communists, the Committee agreed to convoke a National People's Assembly on Nov. 12, 1940, "to enact and promulgate a Constitution for China." The promulgation of the Constitution, if it followed the Kuomintang po-

litical program, would end the period of Kuomintang "tutelage," under which China was ruled by a single-party dictatorship headed by Chiang Kai-shek, and inaugurate representative government based on democratic principles. Meanwhile the committee strengthened Chiang Kai-shek military and civil powers, naming him chief of the Executive Yuan, or Premier, in place of Dr. H. H. Kung. Chiang held his other posts of commander-in-chief of the armed forces, head of the National Defense Council, and director general of the Kuomintang. A general reorganization of the cabinet was also carried out.

The Communist Movement. This picture of growing Chinese unity in the face of Japanese aggression was marred in part by persistent reports of serious friction between conservative elements in the Kuomintang and the Chinese Communists.

While successfully resisting repeated Japanese invasions, the Communists led by the "Red Napoleon," Gen. Chu Teh, had established a government at Yen-an in Shensi province from which they ruled about 1,500,000 inhabitants in parts of Shensi, Kansu, and Ningsia provinces. There they introduced village and district elections, lifted the tax burden on peasants, made the income tax the chief source of revenue, and distributed the large landed estates. The influence of the Chinese Communists also spread into western Shansi and Kansu, being aided by the fact that the Chungking Government depended largely upon Soviet arms and supplies for the defense of northern China and that Soviet penetration into Sinkiang and Kansu was bringing those provinces more and more under Soviet control.

These developments aroused the alarm of anti-Communist elements in the Kuomintang, who denounced the Communist political activities as a violation of the Kuomintang-Communist pact against Japan. The Communists, on the other hand, charged that the army officers, landed gentry, and other conservative Kuomintang elements were more interested in preserving their special privileges than in organizing resistance to Japan. Notwithstanding the fact that Chiang Kai-shek held the balance of power between these two groups and followed a policy of mutual conciliation, there were repeated clashes between Communist and anti-Communist forces in the northwest during the year, even in some cases when the Japanese were pressing forward nearby.

It was reported that Communists and their sympathizers were shot or persecuted in the anti-Communist districts of Shensi, Suiyuan, Ningsia, and Kansu provinces, while the same fate was apparently meted out to anti-Communists in the districts controlled by the Yen-an government. After the Soviet rapprochement with Germany in August and the Soviet-Japanese truce of September, Chinese leaders were reported apprehensive of the possibility that the Soviet Union would reach an agreement with Japan at the expense of China. It was recognized that if Russian foreign policy so dictated, the Soviet Government was in a position to seize political control of all northwestern China through the co-operation of the Chinese Communists.

Yet the Chungking authorities were forced to accept Soviet aid and to acquiesce in the accompanying Soviet military-economic penetration. Another of the Soviet-Chinese barter-and-loan agreements for 140,000,000 U.S. dollars was concluded in August, 1939. In November it was

estimated that the Soviet Union was furnishing two-thirds of all Chinese imports of arms and munitions. Beginning in October Japanese and Chinese reports indicated that the Soviet Union was increasing its military forces in Sinkiang and supplying additional air units, aviators, technicians, military advisers, and war supplies to both the Chungking Government and the Chinese Communists. In mid-October a large Soviet military mission was reported to have reached Chungking.

Diplomatic reports received in Washington in December stated that a string of five Soviet air bases had been established along the old Gobi Desert trail from China to Russia. In the same month Shanghai dispatches reported that the Soviet Union was pressing China to recognize formally the independence of the Outer Mongolian Soviet Republic, actually a Soviet protectorate; to curb the anti-Communist faction of the Kuomintang; and to support the U.S.S.R. at Geneva. Much to Chinese alarm, the coincident Soviet-Japanese negotiations appeared to be making headway toward a general settlement.

Japanese Political Maneuvers. After vain efforts to induce Marshal Wu Pei-fu (see NECROLOGY) to become head of a centralized anti-Chungking pro-Japanese government controlling the Japanese-occupied areas, the Japanese army leaders turned their attention to Wang Ching-wei, former Premier of China, who had deserted the Chungking Government in 1938 (see 1938 YEAR BOOK, p. 157). Wang Ching-wei was active throughout 1939 in attempting to lay the foundations for his projected regime. He made the rounds of Shanghai, Canton, Peiping, and the other chief cities of "occupied" China to confer with Japanese military leaders and to seek the support of influential Chinese. In June he made a secret visit to Tokyo for conferences with Premier Hiranuma and other Japanese political leaders.

Wang's negotiations made slow progress, however. Few unimportant Chinese rallied to his support. He experienced difficulty in reaching an agreement with the Japanese army and government on the program and principles of his future government. Moreover his effort encountered the opposition and jealousy of the two puppet regimes previously established at Peiping and Nanking. (Ministers of these two governments met at Nanking on March 30 and formally repudiated all loans or credits granted to the Chungking Government by foreign powers. They also declared they would refuse to recognize any foreign [non-Japanese] vested rights or interests.)

On August 9 Wang set forth his "peace" program in a radio broadcast and called a "national convention" of the pro-Japanese faction of the Kuomintang, which convened in Shanghai on August 28. According to Japanese sources, this convention, attended by 240 delegates, unanimously elected Wang chairman of its Central Executive Committee. It adopted a political platform acceptable to the Japanese, including co-operation with Japan against communism. Although the Premier of Japan announced on October 15 that Wang's regime would be launched in November, the event had not taken place by the end of the year.

This delay was attributed partly to the Japanese military reverses and partly to the difficulty experienced by Wang Ching-wei and the Japanese

army in agreeing upon the terms of a Sino-Japanese "peace" that was to be concluded between Wang's regime and the Japanese Government. It was reported that Wang insisted upon the immediate withdrawal of Japanese troops from China proper once Chungking's resistance had ended; restoration of Chinese property seized by the Japanese; and equality between Chinese and Japanese in the economic exploitation of China.

On December 9 Wang announced that he had reached an accord on basic principles with the Japanese. It was reported at the year end that these principles included withdrawal of Japanese troops from China within two years after Wang's government concluded "peace" with Japan; nationalization of the Chinese railways; garrisoning of North China and Inner Mongolia by Japanese troops under an anti-Comintern agreement; recognition by Wang's regime of the independence of Manchoukuo; conclusion of an anti-Comintern pact by Wang's government, Manchoukuo and Japan; and joint Sino-Japanese development and exploitation of China's natural resources. Wang thus accepted the basic principles of Japan's "new order" in Eastern Asia that had been proclaimed in 1938 and reiterated in 1939 (see 1938 YEAR BOOK, p. 158 f.).

Japan's Anti-Foreign Drive. A primary feature of Japan's "new order" was the elimination of all foreign rights and interests calculated to interfere with Japanese control and exploitation of the Chinese people and their natural resources. This campaign was pressed with increasing vigor during 1939, with the Japanese concentrating their efforts upon the foreign concessions in China. A series of political assassinations of pro-Japanese Chinese in the International Settlement at Shanghai occurred early in 1939. They afforded the Japanese Foreign Office a pretext for demanding on May 3 a thorough modification of the status of the International Settlement and French Concession. At the same time Japanese military heads defied the authority of the Municipal Council of the International Settlement, which appealed to the foreign consular body for protection.

The United States, British, and French governments rejected Tokyo's demands of May 3 and firmly opposed similar Japanese pressure upon other concessions. On May 12 Japanese naval authorities at Amoy landed marines in the Kulangsu foreign settlement, demanding that the government be reorganized to give the Japanese control of the concession. Britain, France, and the United States immediately dispatched warships to Amoy and on May 17-18 detachments of British, French, and American marines, each equal in size to the Japanese force, were landed at the Kulangsu Settlement. This balked the Japanese temporarily, but the British and French marines were withdrawn upon the outbreak of the European war. The American and Japanese marines remained until October 18, when the Settlement's Municipal Council agreed to co-operate in the suppression of anti-Japanese agitation, to appoint some Japanese policemen, and to enfranchise Formosans.

The three Western powers had meanwhile displayed equally firm resistance to similar Japanese pressure on concessions at Swatow, Foochow, Wenchow, and Ningpo. In Shanghai on May 19 the International Settlement and French Concession authorities had mobilized all available de-

fense forces as a warning against a threatened Japanese coup d'état.

Tientsin Incident. Not wishing to attack the interests of the three Western powers simultaneously, the Japanese military authorities singled out the British Concession in Tientsin as the next major test in their struggle to oust foreign interests. The British authorities at Tientsin had refused to surrender to the Japanese four Chinese suspected of the assassination on April 9 of a pro-Japanese customs inspector. Over two months later, on June 14, the Japanese military leaders instituted a rigid blockade of the British and adjoining French Concessions, asserting that they would maintain it until the British reversed their policy, recognized Japan's "new order" in East Asia, and co-operated in its establishment. Roads and bridges giving access to the concessions were barricaded, food supplies were cut off, and British subjects entering or leaving were searched and often subjected to humiliating treatment, such as the stripping and slapping of both men and women. At the same time a Japanese-instigated anti-British campaign was waged throughout North China, forcing British nationals to evacuate a number of interior cities.

These tactics, for which local army commanders were responsible, had far-reaching objectives in addition to the establishment of Japanese control over the concession. The army leaders wanted to make the British the scapegoats for the failure of their military campaigns against the Chinese; to push the Tokyo Government into accepting a military alliance with Germany; and to force the British Government to end its support of the Chungking Government, particularly British financial support of the Chinese national currency.

The Japanese had sought by currency and foreign exchange control measures to squeeze foreign traders out of the conquered districts of China. But the preference of the Chinese people for the Chinese national currency, its free circulation in the foreign concessions, and its convertibility into foreign exchange had enabled the western traders to survive and had hampered the Japanese economic program. The stability of the Chinese national currency (the yuan) had been greatly strengthened in March when two British banks operating in China advanced the Chungking Government half of a £10,000,000 Stabilization Fund after receiving a British Treasury guarantee against loss.

Anglo-Japanese Negotiations. The British Government opened negotiations for a settlement of the Tientsin situation with the Foreign Office in Tokyo rather than with the intransigent Japanese military leaders in China. On July 24 the British Ambassador recognized in writing the "special requirements" of the Japanese army for maintenance of order in occupied areas of China. It was agreed that the discussions on the Tientsin incident would be governed by this formula. This seemed indirectly to recognize Japan's status as a belligerent in her undeclared war on China without subjecting her to the restrictions imposed on a belligerent under international law.

The British Government then agreed to co-operate more closely with Japanese authorities in maintaining order in Tientsin. It also consented on August 11 to hand over the four alleged Chinese assassins who had taken refuge in the Tientsin Concession. But on August 18 it rejected the Japanese demand that circulation of Chinese national currency be banned within the Tientsin

Concession. The British Ambassador stated that negotiations on the currency and silver questions could be conducted only in conjunction "with other interested powers." The Tokyo negotiations were then broken off.

The following day (August 19) a shooting affray between a British police sergeant and a Japanese-controlled Chinese police squad on the borders of the Shanghai International Settlement led to new Japanese demands upon the Municipal Council there. At the same time 6000 Japanese troops were landed in Shanghai, a Japanese force on the borders of the Kowloon leased territory made preparations to blockade Hong Kong, and restrictions on the British in Tientsin were tightened.

The stage was set for an Anglo-Japanese collision at one or all of these points when the conclusion of the Soviet-German non-aggression pact on August 24 provoked a temporary reversal of Japanese policy. Japanese troops along the Kowloon border were withdrawn and the demands on the Shanghai Settlement Council were dropped. But shortly afterward the outbreak of the European War gave the Japanese confidence that Britain and France could not resist pressure in the Far East.

Early in September the Tokyo Government gave Britain and France "friendly advice" to withdraw their troops from China "lest there be danger of Japanese involvement" in the European conflict. Japanese pressure upon the Shanghai Municipal Council was renewed. On November 12 and 13 the British and French Governments announced the withdrawal of their troops from North China, except for skeleton forces left at Tientsin. This withdrawal was accepted by both Japan and China as a tacit recognition of Japanese dominance in North China. Nevertheless the Japanese announced that the blockade of the Tientsin Concessions would be continued until Japan's "requirements are fulfilled." Toward the end of the year there were some indications that France and Britain were seeking a compromise settlement with Japan to preserve at least part of their properties and privileges in China.

Stand of the United States. Japanese officials attributed the refusal of the British and French to capitulate to Japan's demands to the firm opposition offered by the United States Government to similar pressure. Early in December Chinese sources reported that 36 American missions and schools had been damaged or destroyed and that Japanese airplanes had bombed or machine-gunned American properties more than 150 times since the outbreak of hostilities. But Washington took the lead in refusing to yield to Japanese threats and violence. On June 21 the State Department protested against the Tientsin blockade, which adversely affected American nationals in that city. On July 26 Washington abruptly denounced the Japanese-American treaty of commerce and navigation of 1911 "with a view to better safeguarding and promoting American interests" in China.

This drastic move did not change Japanese determination to establish economic and political hegemony over China. But it forced Tokyo to proceed with caution lest the United States should impose an embargo on exports of vital war materials to Japan upon expiration of the treaty on Jan. 26, 1939. Japanese-American negotiations for a renewal of the treaty and for adjustment of their controversies in China continued during

the rest of the year, without definitive results. They were marked by Ambassador Joseph Grew's assertion before the American-Japan Society in Tokyo on October 19 that the American people "deeply resented" Japanese activities in China.

"The American people," he said, "have good reason to believe that an effort is being made to establish control, in Japan's own interests, in large areas of the continent of Asia and to impose on them a system of closed economy." The Japanese Foreign Minister replied that "the determination of the entire Japanese nation to bring about a new order in East Asia is too strong to be changed or affected by the interference of a third power." November and December witnessed an increase in anti-American threats and hostility from Japanese in both China and Japan. The threats, however, were mixed with some promises. On December 18 the Japanese Foreign Minister promised the American Ambassador that his government would reopen the Yangtze River between Shanghai and Nanking to the trade of all nations and would also reopen the Pearl River leading to Canton "at the proper time."

CHRISTIAN CHURCH. See DISCIPLES OF CHRIST.

CHRISTIAN ENDEAVOR, INTERNATIONAL SOCIETY OF. An organization founded in Portland, Me., in 1881 by the Rev. Francis E. Clark, D.D., a Congregational minister, for the purpose of pledging young people to certain forms of Christian devotion, expression, and service. In 1939 it consisted of 58,000 societies in the United States and Canada, with a membership of more than 2,500,000. Throughout the world there were in the same year approximately 80,000 societies, with a membership of more than 4,000,000 in 105 countries, dominions, and island groups, representing more than 80 evangelical and reformed denominations. These societies were united into national unions which, in turn, composed the World's Christian Endeavor Union.

In 1938 was held the tenth World's Convention at Melbourne, Australia, with 26 nations represented. This was followed by a world journey of Dr. Poling, the president. The outstanding event of 1939 was the International Convention in Cleveland, Ohio, and the introduction of a two-year program under the title, "Christ Calls!" The next International Convention will be held in July, 1941.

The Rev. Daniel A. Poling, D.D., LL.D., is president, and the Rev. William Hiram Foulkes, D.D., Mr. Harry N. Holmes, Rev. Arthur J. Stanley, and Mrs. Helen Lyon Jones are vice-presidents. The official magazine is the *Christian Endeavor World* (monthly). Headquarters are in the World's Christian Endeavor Building, Mt. Vernon and Joy Streets, Boston, Mass.

CHRISTIAN REFORMED CHURCH. See RELIGIOUS ORGANIZATIONS.

CHRISTIAN SCIENCE. A system of metaphysical or spiritual healing, discovered by Mrs. Mary Baker Eddy in 1866 and set forth in her textbook of the movement, *Science and Health with Key to the Scriptures*, first published in 1875. The first church was established by Mrs.

Eddy in Boston, in 1879. In 1892 it was reorganized as a voluntary religious association, known as The First Church of Christ, Scientist, in Boston, but called more frequently by its adherents "The Mother Church." The total number of recognized branches of The Mother Church in the United States reported for the fiscal year ending May 31, 1939 was 2175 and 67 college and university organizations. Total branches for the world 2853.

The affairs of The Mother Church are administered by a board of directors which supervises the work of the board of education, board of lecturership, and committee on publication. The board of education instructs and authorizes students to teach Christian Science. The board of lecturership consists of 22 members who are engaged in delivering free lectures on Christian Science.

The Christian Science Publishing Society, whose affairs are administered by a board of trustees according to the Manual of the church, issues the daily paper of the organization, *The Christian Science Monitor*. Other periodicals include *The Christian Science Journal*, *Christian Science Sentinel*, *Christian Science Quarterly*, and four editions of *The Herald of Christian Science* in the German, French, Dutch, and Scandinavian languages, each with the English translation opposite, and in Braille.

The benevolent association of the church conducts sanatoria in Brookline, Mass., and San Francisco, Calif. Pleasant View Home at Concord, N. H., is a home for Christian Scientists of advanced years. Mr. George Shaw Cook is president of The Mother Church for the year 1939-40. Headquarters are at 107 Falmouth Street, Boston, Mass.

CHRISTMAS ISLAND. The name of two separate islands. (1) An island in the Indian Ocean (10° 30' S. and 105° 40' E.), a dependency of the Straits Settlements. Area, 60 square miles; population (1938), 1313. Phosphate of lime is exported (162,000 metric tons in 1938). (2) The largest atoll in the Pacific (2° N. and 157° W.), over 100 miles in circumference, included in the (British) Gilbert and Ellice Islands Colony. It is leased to the Central Pacific Coconut Plantations, Ltd., for a period of 87 years from Jan. 1, 1914. Population (1937), 47.

CHROMIUM. Special interest attached to this metal and its ores in 1939 because the United States Government began late in the year to accumulate a stock pile of ore under authority of the Strategic Materials Act. Being a minor producer, and at the same time the leading consumer, of chromium, the United States is dependent on Rhodesia, the Philippines, Union of South Africa, Cuba, New Caledonia, and Turkey for supplies.

According to the Bureau of Mines, domestic production in 1938 was only 812 tons of high-grade ore valued at \$10,730. Imports for that year were 352,085 tons of ore containing 163,570 tons of chromic oxide.

The steel industry accounts for more than three-fourths of domestic consumption, the remainder being used in making refractories, chemicals for pigments, tanning, and chrome plating.

The Procurement Division of the Treasury Department announced late in the year the award of a number of contracts for chrome ore under the provisions of the Strategic Materials Act. One contract for 20,000 tons was awarded to the Mutual Chemical Co., export representative of

the Turkish government. Another contract for 25,000 tons of Alaskan ore was also awarded.

H. C. PARMELEE.

CHRONOLOGY. The following chronology lists the more important happenings of the year 1939 according to the dates of occurrence. In most cases, these events are treated in detail under their respective headings. To such articles, particularly those on leading countries and states, such as UNITED STATES, GREAT BRITAIN, and NEW YORK, the reader is referred for additional information. For a list of prominent persons who died during the past year, reference should be made to the article **NECROLOGY** and the more important obituary notices there listed. See also **EUROPEAN WAR** for important military events.

JANUARY

1—**Frank Murphy**, former Governor of Michigan, was appointed Attorney-General of the United States by President Roosevelt.

3—The 76th Congress convened in Washington. Premier **F. Konoye** of Japan resigned and was succeeded by Baron **Kichiro Hiranuma**.

5—President **Roosevelt** in his budget message to Congress asked for \$9,000,000,000 for the year beginning July 1, 1939, including more than \$1,390,000,000 for national defense and \$2,266,000,000 for recovery and relief.

Felix Frankfurter, Harvard law professor, was nominated by President **Roosevelt** for justice of the U.S. Supreme Court. He was confirmed on January 17, succeeding Justice **Benjamin Cardozo**.

7—**Thomas J. Mooney**, serving a life term for the bombing of the San Francisco Preparedness Day Parade on July 22, 1916, was pardoned by Gov. **C. L. Olson** of California.

11—Prime Minister **Neville Chamberlain** of Great Britain and Premier **Benito Mussolini** of Italy conferred in Rome.

12—The Spanish Insurgents captured **Falset**, 22 miles from Tarragona, in Catalonian drive.

Lincoln Ellsworth, explorer, claimed 80,000 square miles of Antarctic territory for the United States.

15—Spanish Insurgents captured Tarragona on the Mediterranean and Tarrega on the road to Cervera.

Chungking, provisional capital of China, was bombed by Japanese airmen.

16—Minor bombings, ascribed to the Irish Republican Army, occurred in various British cities.

20—Chancellor **Hitler** removed Dr. **Hjalmar Schacht**, president of the German Reichsbank, replacing him with Economics Minister **Walther Funk**.

21—Imperial Airways flying boat, *Cavalier*, enroute from Port Washington, L. I., to Bermuda, was forced down in the Atlantic. Three of its 13 passengers were drowned, the others remaining afloat with life preservers for 10 hours until rescued by a Standard Oil tank steamer.

24—Earthquakes in Chile took a toll of nearly 50,000 lives and caused a property loss of \$50,000,000.

26—Spanish Insurgents entered Barcelona.

27—The U.S. Senate passed the Deficiency Relief Bill, giving to the President (as did the House on January 13) \$150,000,000 less than he requested.

President **Roosevelt** stated that he had approved the purchase by France of an undesignated number of military airplanes in the United States.

FEBRUARY

3—President **Roosevelt** publicly denied press reports that he had said to the Senate Committee on Military Affairs that "America's frontier is on the Rhine."

6—President **Roosevelt's** nomination of **Floyd H. Roberts** to be a Federal judge in Virginia was rejected by the Senate, 72 to 9.

9—The island of Minorca, off the Mediterranean coast of Spain, was occupied by the Spanish Insurgents, after the removal of 450 Loyalist refugees on a British cruiser.

10—Pope **Pius XI**, 81, died in the Vatican.

Japanese troops occupied the Chinese island of Hainan, off French Indo-China.

13—The Mexican government expropriated 50,000 acres of land belonging to the U.S. Sugar Company and distributed them among native farmers.

Louis D. Brandeis, 82, associate justice of the U.S. Supreme Court, announced his retirement in a letter to President **Roosevelt**.

15—**Bela Imrédy**, Premier of Hungary and sponsor of anti-Semitic laws, resigned when it was disclosed that his mother's grandfather was born a Jew.

19—Soviet Russia and Poland signed a trade agreement at Moscow.

23—The U.S. House, 205 to 168, eliminated the island of Guam from the naval construction programme following statements in the Japanese press that fortification of the island would be deemed provocative.

25—James J. Hines, 63, a New York City Democratic (Tammany) District leader, was found guilty of conspiracy and with feloniously contriving a lottery with the late Arthur Fleigenheimer (Dutch Schultz). His sentence on March 23 of four to eight years was held in abeyance pending his appeal to the higher courts.

27—The U.S. Supreme Court declared the sit-down strike an illegal labor weapon.

Great Britain and France officially recognized the Insurgent regime as the legal government of Spain.

28—Manuel Azaña resigned as President of the Republic of Spain.

MARCH

2—Eugenio Cardinal Pacelli, Papal Secretary of State, was elected Pope by the Sacred College of Cardinals. He took the name of Pius XII.

8—The British Government extended a £5,000,000 credit to the Chinese Government to support the Chinese dollar.

10—Joseph Stalin at the all-Union Communist Party Congress, said the press of the United States, France and Great Britain "by creating noise over the Ukraine, are trying to arouse the fury of the Soviet Union against Germany to poison the atmosphere and provoke a conflict without any apparent cause."

The Rev. Joseph Tiso, Premier of Slovakia, was removed from office by President Emil Hacha of Czechoslovakia. On March 13 Tiso flew to Berlin and received from Chancellor Hitler a promise of military aid in Tiso's plan for an independent Slovak republic.

14—In Bratislava, the Parliament of Slovakia voted to sever all connection with Czechoslovakia and elected Tiso President and Premier of the new country. Following conference between President Hacha and Chancellor Hitler in Berlin, the Prague Government officially dissolved the Republic of Czechoslovakia.

Hungarian troops invaded the Carpatho-Ukraine.

15—German troops began occupancy of Bohemia and Moravia, meeting little resistance. Reich soldiers invested Prague and Chancellor Hitler, who had traveled from the Czech border by automobile, spent the night at Prague's historic Hradshin Castle.

16—Following an appeal from President Tiso, Chancellor Hitler in Prague proclaimed Slovakia a German protectorate.

Premier Paul Teleky of Hungary announced that Carpatho-Ukraine had become "a part of the Kingdom of Hungary."

17—The United States, Great Britain, France and Russia officially condemned Germany's annexation of Bohemia and Moravia.

18—Germany and Great Britain recalled their Ambassadors for consultation.

The United States announced the imposition of countervailing duties of 25 per cent on many German articles of export.

20—The United States and Germany recalled their Ambassadors.

24—In Powell, Wyoming, Earl Durand, 26, a hunter whom peace officers had sought to arrest for poaching, shot himself to death during a bank holdup in which he had been wounded. He had slain four constables in nine days.

27—Japanese troops occupied Nanchang.

The U.S. Supreme Court ruled that State employees are subject to Federal income taxation and that the incomes of Federal employees may be taxed by the States in which they reside.

28—Madrid capitulated to the Spanish Insurgents.

31—Prime Minister Chamberlain stated in the House of Commons that: "In the event of any action which clearly threatened Polish independence and which the Polish Government accordingly considered it vital to resist with their national forces, His Majesty's government would feel themselves bound at once to lend the Polish government all the support in their power."

Hungary and Slovakia settled their boundary dispute with a net gain of 10 villages and 800 square miles to Hungary.

Japan announced annexation of the Spratly Islands.

APRIL

1—The Franco Government in Spain was officially recognized by the United States and the embargo on munitions to Spain, effective since Jan. 8, 1937, was lifted.

3—The Soviet Government announced that it had not obligated itself to assist Poland with supplies in the event of a German-Polish war.

4—Faisal II, three years old, was proclaimed King of Iraq, succeeding his father, Ghazi I, 27, who was killed

in an automobile accident. Frenzied by the belief that the British had assassinated their monarch, a mob stormed the British Consulate in Mosul, 200 miles northwest of Baghdad, and killed the Consul, George E. Monck-Mason.

Foreign Minister Josef Beck of Poland and Prime Minister Chamberlain conferred in London on Great Britain's guarantee to Poland.

In France, Albert Lebrun was re-elected President by the National Assembly in Versailles.

Chancellor Hitler named Baron C. von Neurath civil administrator (Protector) of Bohemia and Moravia.

8—Italian troops invaded Albania and in a series of quick moves subjugated the country. Queen Geraldine, with her 3-day-old son, fled in a Red Cross ambulance to Greece, where she was joined the next day by King Zog.

Secretary of State Hull termed Italy's action "a forcible and violent invasion" and "an additional threat to the peace of the world."

10—After a talk with the British Minister to Greece, Premier John Metaxas declared the "Greek Government declares that it has all the requisite means to enable it to tell the Greek people that the independence and integrity of the country are absolutely assured."

13—Prime Minister Chamberlain announced in the House of Commons that the British guarantee to Poland, as stated on March 31, had been extended to Greece and Rumania.

15—Premier Mussolini and Chancellor Hitler received identical cablegrams from President Roosevelt asking them to pledge themselves not to go to war against certain specified countries for a period of ten years. In return, the President promised to call a world conference for disarmament and for increasing the accessibility of raw materials and products to all countries.

17—The U.S. Supreme Court ruled that past membership in the Communist Party was not a sufficient ground for deportation.

23—The British and French Ambassadors returned to their posts in Berlin.

The Franco Government in Spain ordered restored to King Alfonso XIII and his relatives all property of theirs confiscated by the Spanish Republic.

24—Lieut. Col. German Busch, President of Bolivia, dissolved the Congress, suspended the Constitution and all existing laws and established a political and financial dictatorship.

26—President Roosevelt signed the \$549,000,000 War Department Appropriation Bill.

27—The British House of Commons voted for compulsory military training in the United Kingdom as "necessary for the safety of the country and fulfillment of undertakings recently given to certain countries of Europe."

28—Chancellor Hitler, in a speech before the Reichstag, declared President Roosevelt's request for a non-aggression pledge unacceptable, but that Germany had no intention of attacking the United States or any other nation. He said Germany wanted back the territories lost in the World War, including Danzig, and a right of way across the Polish Corridor. He announced abrogation of Germany's non-aggression pact with Poland, the Anglo-German naval agreement and the Munich agreement with Great Britain.

MAY

3—In Soviet Russia, Maxim Litvinov, Commissar for Foreign Affairs since 1929, resigned and was succeeded by Vyacheslav M. Molotov, President of the Council of People's Commissars.

4—Japanese planes bombed Chungking, provisional capital of China, taking an estimated toll of 5000 lives.

5—Gen. Anastasio Somoza, President of Nicaragua, arrived in Washington on a visit of state.

Soft coal production was almost completely halted when the United Mine Workers and coal operators failed to reach an agreement on a new contract.

6—The Turkish Government announced a mutual assistance pact with Great Britain.

7—Italy announced an iron-clad political and military agreement with Germany, following conferences in Milan between their respective Foreign Ministers, Count Galeazzo Ciano and Joachim von Ribbentrop.

10—German proposals for non-aggression treaties were formally rejected by Finland, Norway, and Sweden on the ground that acceptance would compromise their neutrality.

11—Fighting began between Japanese-Manchoukuo and Mongol-Soviet troops on the Manchoukuo-Outer Mongolia border southeast of Lake Bor. Hostilities continued for several months.

13—Negotiators for miners and operators in the soft coal industry reached an agreement to accept a two-year contract with no wage or hour changes.

17—King George VI and Queen Elizabeth of Great Britain landed in Quebec from the steamship *Empress of Australia*.

Denmark accepted Germany's non-aggression pact proffer.

22—In Toronto, the Dionne quintuplets were received by Queen Elizabeth and King George in a special audience.

Germany and Italy signed a 10-year military alliance, which stated: "If contrary to the wishes and hopes of the contracting parties it should happen that either of them should become involved in military entanglements with one other power or with other powers, the other contracting party will immediately rally to his side as ally and support him with all his military resources on land, at sea and in the air."

Thomas J. Pendergast, 67, Democratic leader of Kansas City, Mo., pleaded guilty to income tax evasion and was sentenced to one year and three months in prison and fined \$10,000 in Kansas City Federal Court.

23—The U.S. submarine *Squalus* sank with 59 men aboard five miles southeast of the Isle of Shoals, off Portsmouth, N. H., with a loss of 26 lives; 33 men, including the commander, were saved on May 24 by means of a 10-ton "diving bell" steel rescue chamber.

25—Japanese airmen again bombed Chungking, provisional capital of China.

Grover Cleveland Bergdoll, World War draft dodger, returned to New York from Germany and was arrested by army officials on a desertion charge.

31—Foreign Commissar Molotov announced that Soviet Russia would not conclude mutual assistance-defensive pacts such as Great Britain had recently negotiated with Poland and Turkey unless the scope were widened to include Finland, Estonia, and Latvia.

JUNE

1—British submarine *Thetis* sank in Liverpool Bay. Only four of 103 men aboard were saved.

The U.S. House, by a vote of 302 to 97, turned down the Townsend Old-Age Pension Bill.

Ex-Judge Martin T. Manton of the U.S. Circuit Court of Appeals was found guilty in New York City of conspiracy to defraud by selling justice while on the bench. A sentence of two years in prison and a fine of \$10,000 were imposed on June 20.

5—The U.S. Supreme Court sustained an injunction granted by a lower court restraining Mayor Frank Hague and the Jersey City police from nullifying the constitutional right of free speech and assembly.

6—Supreme command of the French army, navy, and air force was vested in Gen. Marie Gustave Gamelin.

7—King George and Queen Elizabeth crossed the American border at Niagara Falls, N. Y., and were greeted by Secretary of State Cordell Hull and Mrs. Hull.

8—The British monarchs were met at the Union railway station in Washington, D. C., by President and Mrs. Roosevelt. The party motored to the White House where an official reception was held, followed by a state dinner in the evening.

14—The British concession at Tientsin, China, was blockaded by Japanese troops, following refusal of the British to surrender to the Japanese four Chinese fugitives accused of terrorism and assassination.

15—Responsibility for the Black Tom and Kingsland, N. J., explosions of 1916-17 was placed on the German Government by U.S. Supreme Court Justice Owen J. Roberts acting as umpire for the German-American Mixed Claims Commission.

22—King George and Queen Elizabeth reached England on the liner *Empress of Britain* on their return home from their visit to Canada and the United States.

23—France and Turkey signed a military alliance and treaty under which the Hatay Republic (Sanjak of Alexandretta), part of France's mandated territory of Syria, was ceded to Turkey.

26—Governor Richard Leche of Louisiana resigned and was succeeded by Earl Long, lieutenant-governor and brother of the late Huey Long.

29—The airplane *Dirie Clipper*, with 22 passengers and a crew of 11, arrived in Lisbon, Portugal, from Port Washington, N. Y., on the first commercial passenger flight of an airplane from the United States to Europe.

JULY

5—President Roosevelt's power to alter the gold content of the dollar and to affect foreign exchange rates by operation of the \$2,000,000,000 stabilization fund was extended to June 30, 1941, by the U.S. Senate.

7—Chungking, temporary capital of China, was bombed by Japanese airmen.

11—The Foreign Relations Committee of the U.S. Senate voted to postpone revision of the Neutrality Law to the "next session of Congress."

17—The proposed Battery-Brooklyn bridge over the East River at New York City was rejected by the U.S. War Department as a potential menace to naval navigation if bombed in wartime.

22—Great Britain and Japan signed an agreement by which the British recognized that the "Japanese forces

in China have special requirements for the purpose of safeguarding their own security and maintaining public order in the regions under their control."

25—A new treaty between the United States and Panama, superseding that of 1903, and granting the United States special war time rights in the Isthmus, was ratified by the U.S. Senate, 65 to 15.

26—The United States gave formal six-months notice to Japan of abrogation of its 1911 commercial treaty with that country.

AUGUST

2—Gov. R. L. Carr of Colorado called out national guard to restore order at strike-bound Green Mountain Dam.

5—First session of 76th U.S. Congress adjourned.

11—Nine soldiers, including two officers, were killed when U.S. Army bombing plane crashed near Langley Field, Va.

13—Passenger train bound for San Francisco from Chicago jumped the track at the Humboldt River Canyon, Nev., killing 23 and injuring 109 persons.

15—U.S. Government paid \$44,728,300 to the Commonwealth and Southern Corporation and took formal possession of the Tennessee Electric Power Company properties.

16—Japanese troops invaded territory adjoining Hong Kong.

Mayor Frank Hayes of Waterbury, Conn., and 19 other city employees, were found guilty of fraud. Hayes was sentenced to from 10 to 15 years.

18—Germany assumed military control of Slovakia.

19—Soviet Russia and Germany signed a far-reaching trade agreement.

21—A 10-year mutual non-aggression pact was concluded by Soviet Russia and Germany and formally signed on Aug. 24.

22—Great Britain announced that her obligations to Poland were unaffected by Russo-German trade and non-aggression pacts.

23—President German Busch of Bolivia shot himself to death.

24—In peace appeals to Germany, Poland, and Italy, President Roosevelt urged direct settlement, arbitration or conciliation of the Danzig-Polish Corridor dispute.

A law making Albert Forster "supreme head of . . . Danzig" was passed by the Danzig Senate.

26—Proposals and counter-proposals regarding Danzig and Poland were carried to and from London and Berlin by Sir Neville Henderson, British Ambassador to Berlin.

27—In a letter to Premier Daladier of France, Chancellor Hitler said the Polish Corridor "must return to Germany" and that "the Macedonian conditions on our eastern frontier must be removed."

28—Gen. Nobuyuki Abe succeeded Kiichiro Hiranuma as Premier of Japan.

30—Chancellor Hitler demanded immediate return of Danzig, a plebiscite in the Corridor, and free access of Germany to East Prussia, offering in return to guarantee the port of Gdynia to Poland.

German liner *Bremen* sailed from New York for an undisclosed destination.

SEPTEMBER

1—German troops invaded Poland in what was officially described as "counter-attack with pursuit." Warsaw, Cracow, Kattowitz, Gdynia, and Teschen were bombed from the air. Great Britain and France, in ultimatums, notified Berlin that unless German soldiers were recalled from Polish soil in 24 hours, Britain and France would go to war for Poland.

3—Prime Minister Neville Chamberlain told Parliament that Germany had ignored the British ultimatum and that consequently a state of war between Germany and Great Britain had begun at 11 a.m. September 3. France's ultimatum expired at 5 p.m. and war between France and Germany began automatically at that hour. Australia and New Zealand entered the war later the same day.

The British steamship *Athenia*, bound for Montreal, was sunk by a submarine 200 miles northwest of Ireland with a loss of 122 persons, including 29 Americans.

5—One German army came within 21 miles of Warsaw and shelled the city with long-range guns.

President Roosevelt—under the existing neutrality law—proclaimed an embargo on the shipment of arms, munitions, airplanes, and airplane parts to Germany, Poland, France, the United Kingdom, India, Australia, and New Zealand.

8—German soldiers occupied suburbs of Warsaw.

10—Canada declared war on Germany.

11—Warsaw was bombed 17 times by German airmen.

14—Gdynia surrendered to the Germans.

The Duke of Windsor had tea with his brother, King George VI, at Buckingham Palace, their first meeting since the abdication.

15—Soviet Russia and Japan agreed to an armistice on the Manchoukuo-Outer Mongolia border.

16—Soviet troops crossed the Polish frontier "to protect" Russian "interests and to protect the White Russian and Ukrainian minorities."

17—The British aircraft carrier *Courageous* was sunk by a German submarine.

President Ignace Moscicki and Foreign Minister Josef Beck and many other Polish officials, soldiers, and civilians fled to Cernauti, Rumania.

21—In Rumania, Premier Armand Calinescu was assassinated by members of the Iron Guard (Fascist) organization.

27—Warsaw surrendered to the German armies.

28—Soviet Russia and Germany signed a compact sealing "the disintegration of the Polish State" and dividing the country between them.

29—Estonia and Soviet Russia signed a mutual assistance pact giving the latter the right to establish army, naval, and air bases on Estonian soil.

OCTOBER

2—Pan-American Conference adopted a declaration enjoining belligerent nations from aerial or naval warfare within a "safety zone" extending roughly 300 miles from the ocean shore of all the American republics.

5—Soviet Russia and Latvia concluded a military pact which provided for Russian naval, aerial, and army bases on Latvian soil.

Grover C. Bergdoll, Philadelphia World War draft dodger, was court-martialed on Governors Island, found guilty and sentenced to three years in prison at hard labor.

9—The U.S. steamship *City of Flint* was seized in the Atlantic by the German battleship *Deutschland*. It was released to its American crew by the Norwegian Government (Oct. 20) at Haugesund where, under a German prize crew, it stopped en route from Murmansk to Hamburg.

Finnish delegation arrived in Moscow to negotiate military pact.

10—Soviet Russia and Lithuania signed a 15-year mutual assistance pact by which Vilna was restored to Lithuania and Russia was permitted to establish military bases on Lithuanian soil.

12—U.S. Ambassador Steinhardt, on instructions from President Roosevelt, appealed to Soviet Russia to be moderate in its demands on Finland.

14—British battleship *Royal Oak* was sunk by a German submarine.

16—Warren K. Billings, serving life term in 1916 San Francisco bombing case, freed by Governor Olson of California.

19—Turkey signed a 15-year military pact with France and Great Britain, pledging mutual assistance in the event of European aggression in the Mediterranean area, but specifically releasing Turkey from any obligation to go to war with Russia.

27—U.S. Senate repealed the arms embargo bill, 63 to 30.

NOVEMBER

2—U.S. House repealed arms embargo bill, 243 to 181.

4—President Roosevelt in two proclamations barred American shipping from the European "combat area" and barred foreign submarines from United States ports.

7—A joint offer to mediate the European war was issued by Queen Wilhelmina of the Netherlands and King Leopold of Belgium.

8—Chancellor Hitler narrowly escaped death when a time-bomb exploded in a Munich beer hall (killing eight persons), a few minutes after he had left.

13—Finnish delegates returned home after unsuccessful effort to reach an accord with Soviet Russia.

15—Serious riots broke out among Czech students and others in Prague, followed by wholesale arrests and executions by German troops.

16—Alphonse Capone was formally released from prison, after serving more than seven years for income tax evasion.

20—Magnetic mines were dropped by parachute from German airplanes into British waters.

22—City ordinances prohibiting door-to-door canvassing and the distribution of pamphlets in streets were found unconstitutional by the U.S. Supreme Court.

24—Japanese forces occupied the city of Nanning, in south China.

26—The Soviet Government charged that Finnish artillery killed four and injured nine Red soldiers on the Karelian Isthmus.

23—British armed merchant ship *Rawalpindi* was sunk in an engagement with the German battleship *Deutschland*.

28—Soviet Russia formally denounced its non-aggression pact with Finland.

29—Soviet Russia severed diplomatic relations with Finland and mobilized troops on the Finnish border.

30—Soviet Russia launched a four-pronged military

assault on Finland. Red airplanes bombed many Finnish cities, including Helsinki, where 200 persons were reported killed.

President Roosevelt in identical notes appealed to Finland and Russia to refrain from bombing unfortified cities.

DECEMBER

1—A "People's Government of Finland," reportedly established by Finnish Communists at Terijoki, Finland, was officially recognized by Soviet Russia.

Helsinki was bombed three times by Soviet airmen.

2—Petsamo was occupied by Soviet forces, retaken by Finnish troops, and recaptured by the Red Army in fierce fighting.

President Roosevelt asked American aircraft firms not to export planes or aeronautical equipment to nations guilty of "bombing and machine-gunning civilian populations."

King George VI of Great Britain landed in France for an inspection of his troops.

Great Britain and France officially instituted their two-way blockade of Germany.

Fritz Kuhn, German-American Bund leader, was sentenced to two and a half to five years for larceny and forgery.

7—The Fascist Grand Council reaffirmed the Rome-Berlin Axis, but warned Russia to keep hands off the Balkans.

8—The United States protested Great Britain's blockade of German exports.

The United States Government extended credits of \$10,000,000 to Finland for the purchase of "civilian supplies" in this country.

11—U.S. Supreme Court ruled that evidence obtained by wire-tapping is inadmissible in Federal courts.

The League of Nations sent a telegram to Soviet Russia requesting that hostilities be ended and the Finnish-Russian dispute submitted to the League for arbitration.

12—Soviet Russia informed the League of Nations that Finland and Russia were not at war.

The German liner *Bremen* arrived at a German seaport after a dash from Murmansk, Russia.

A Franco-British economic agreement fixed the parity rate between the franc and the pound sterling at 176 francs to the pound, and eliminated transfers of gold between the two countries.

Russian steamer *Indigirka* sank in a lonely strait between the islands of Sakhalin and Hokkaido (Japan), carrying more than 700 fishermen and their wives to their deaths. About 400 were rescued.

13—After an 18-hour battle with three British light cruisers—the *Exeter*, *Ajax*, and *Achilles*—the German pocket battleship *Admiral Graf Spee* took refuge in Montevideo harbor, Uruguay, with 36 dead and 60 wounded. British casualties were 72 killed—61 of them on board the *Exeter*—and 31 wounded.

14—The League of Nations declared that Soviet Russia had "placed itself outside the League of Nations."

Soviet troops occupied Salmijaervi, Finnish nickel-mining center.

First major air battle of the Anglo-German war was fought over Helgoland naval base.

15—Finland paid its semi-annual debt installment of \$234,693 to the United States.

The Communist party in the United States lifted its boycott of German goods.

The Finnish army claimed the recapture of Suomussalmi.

16—Vice-president John Nance Garner, at Uvalde, Texas, announced his candidacy for the Presidency.

17—The pocket battleship *Admiral Graf Spee* was blown up and sunk by her crew at the mouth of the River Plate, near Montevideo.

18—The first contingent of Canadian troops arrived in England.

British bombers engaged German pursuit planes over Helgoland Bight in major air battle.

A British submarine destroyed one German cruiser, crippled two others and sank a U-boat, according to the Admiralty in London.

Officers and crew of the sunken *Admiral Graf Spee* were interned in Buenos Aires.

19—The German liner *Columbus* was scuttled by her crew when intercepted by a British cruiser 450 miles east of Cape May, N. J. The U.S.S. *Tuscaloosa* picked up 577 survivors. Two members of the crew were reported missing.

The German freighter *Arauca* was chased into Fort Lauderdale harbor, Florida, by the British cruiser *Orion*. Russian airmen bombed five Finnish cities—Helsinki, Abo, Borga, Viborg, and Hangoe.

20—In Buenos Aires, Capt. Hans Langsdorff, commander of the sunken battleship *Admiral Graf Spee*, shot himself to death.

21—Col. F. C. Harrington, WPA administrator, an-

nounced that on Dec. 13, 1939, there were 2,122,960 persons obtaining Federal relief as compared with 3,184,927 on Dec. 14, 1938.

22—Collision of two railway trains in Germany took 132 lives, bringing to 238 the number of persons killed in train accidents in Germany since the war began.

23—The United States and the 20 other American republics jointly protested to Great Britain, France, and Germany against naval warfare in the safety zone proclaimed by the Panama Inter-American Conference.

President Roosevelt appointed Myron C. Taylor as his personal Ambassador, without portfolio, to the Vatican.

24—Pope Pius XII outlined five conditions essential to "a just and honorable peace" as follows—a guarantee of independence to all nations, general disarmament, the creation or reshaping of international bodies to assure faithful observance of international undertakings, the fulfillment of "the true needs" of nations and ethnic minorities, and abandonment of all hatreds for "moral justice" in keeping with Christian ideals.

27—Earthquake in Eastern and Northern Anatolia, Turkey, took a toll of 30,000 to 50,000 lives and caused widespread property damage.

Great Britain announced that the United Kingdom and Sweden had signed a war-time trade agreement.

28—Pope Pius XII made a visit of state to the King and Queen of Italy at the Quirinal Palace; repaying a like visit of the Italian rulers to the Vatican.

31—Near Lake Kianta, the Finns inflicted a crushing defeat on the 163d Russian Division, consisting of some 18,000 men, who were cut off from the main Soviet army and virtually annihilated.

CINCINNATI, UNIVERSITY OF. An institution for the higher education of men and women in Cincinnati, Ohio, founded in 1870. The enrollment for the autumn of 1939 was 10,570, and for the summer session, 1084. There were 689 members on the faculty. The endowment funds for the year amounted to \$9,629,874; the income for the same period was \$349,300. The library contained 480,367 volumes. A \$500,000 addition to the chemistry building was made. CIVIC FEDERATION, THE NATIONAL.

This movement was organized in 1900 to seek the solution of some of the great problems related to social and industrial progress. It provided especially for the discussion of questions of national import, aided in the crystallization of an enlightened public opinion, and promoted legislation when desirable.

During 1939 the Federation initiated a campaign to rally public opinion in opposition to burdensome taxation in the securities field, believing that the resumption of prosperity was not possible until certain obstacles were removed from the channels through which private funds flow into economic structure.

Also, the Federation created a Religious Recovery Division, designed to stimulate church attendance and support by enlisting the aid of

business. The underlying purpose was to preserve Americanism and discourage the spread of subversive movements. The first step in this direction was the publication before Christmas of full-page advertisements in papers throughout the country.

The founder and chairman of the Executive Council of the Federation, Ralph M. Easley, died on Sept. 7, 1939. He was succeeded by Mack W. Beeks. The headquarters are at 45 East 34th Street, New York City.

CIVIL AERONAUTICS AUTHORITY.

See AERONAUTICS.

CIVIL ENGINEERS, AMERICAN SOCIETY OF.

An association of professional engineers, founded in 1852 to advance engineering and architectural knowledge and practice, to maintain high professional standards, and to encourage intercourse among men of practical science.

The membership as of Dec. 26, 1939, was 16,065. There were 63 local sections and 120 affiliated student chapters in colleges and universities throughout the United States.

The Spring Meeting of the Society was held in Chattanooga, Tenn., April 19-22, and included a discussion of the construction program and activities of the Tennessee Valley Authority, and inspection trips to power plants and points of scenic interest in Tennessee and North Carolina.

The 69th Annual Convention took place in San Francisco, July 26-28, during the Golden Gate International Exposition. At all of these meetings, sessions were also held by several of the Technical Divisions, presenting papers in their own specific fields.

The Society publishes two monthly magazines: *Civil Engineering*, which presents news of society affairs and articles of more popular appeal; and *Proceedings*, which contains technical papers that are later collated, with discussions, in the yearly volume of *Transactions*.

At the Annual Meeting, held in New York City, Jan. 18-21, 1939, there were awarded medals and prizes for papers published in the "Transactions" for 1937. These included the Norman Medal to Hunter Rouse, the J. James R. Croes Medal to E. C. Hartmann, the James Laurie Prize to Leon S. Moisseiff, the Arthur M. Wellington Prize to Charles M. Noble, and the Collingwood Prize for Juniors to Douglas M. Stewart.

The officers of the society in 1939 were: President, Donald H. Sawyer; vice-presidents, E. N. Noyes, Malcolm Pirnie, Charles M. Reppert, James L. Ferebee; secretary, George T. Seabury; treasurer, Otis E. Hovey. Headquarters are in the Engineering Societies Building, 33 West Thirty-ninth Street, New York City.

CIVILIAN CONSERVATION CORPS.

The Civilian Conservation Corps was established in April, 1933, to furnish employment, as well as vocational training for youthful citizens of the United States who are unemployed and in need of employment, and to a limited extent for war veterans and Indians, through the performance of useful public work in connection with the conservation and development of the natural resources of the continental United States, Alaska, Hawaii, the Virgin Islands, and Puerto Rico.

The CCC was created by Act of Congress approved June 28, 1937, succeeding the emergency agency known as the Emergency Conservation Work which was established by Executive Order 6101 dated April 5, 1933, under the Act of March 31, 1933 (Public No. 5, 73rd Congress). The 1937

Act (Public No. 163, 75th Congress) which established the Civilian Conservation Corps, also extended its period of operation until July 1, 1940. This Act was amended Aug. 7, 1939, providing for the continuation of the Corps through June 30, 1943.

The CCC operated as an independent government agency from April, 1933, through June 30, 1939. On July 1, 1939, it became a part of the Federal Security Agency created by the President under the Reorganization Act of 1939. Robert Fechner, appointed as Director of the CCC upon its establishment, headed the organization until his death Dec. 31, 1939. James J. McEntee, Executive Assistant to the Director since the CCC began operations, is now Acting Director.

The Corps operates a chain of 1500 outdoor camps for young men and war veterans throughout the continental United States, and approximately 100 smaller camps on Indian reservations and in the territories and insular possessions. By legislation, the enrolled strength of the Corps is limited to a maximum of 270,000 junior enrollees, 30,000 war veterans, 10,000 Indians, and 5000 territorials.

The CCC program is headed by a Director, appointed by the President, by and with the advice and consent of the Senate, who is charged with complete and final authority in the functioning of the Corps. He is assisted by three co-operating government departments—War, Interior, and Agriculture—the Veterans Administration and a large group of State welfare and conservation agencies.

The general program and objectives of the CCC have continued unchanged since its establishment. Each year the Corps has offered an opportunity for security, gainful employment, academic, vocational, and job training to hundreds of thousands of idle young men. Each year has seen great progress made in the conservation work programs carried out on the nation's forests, parks, and farm lands. Some 150 major types of work have been and are being carried out from CCC camps in furtherance of this program. By planting trees over hundreds of thousands of acres of wastelands, by demonstrating proper measures for soil erosion control on farms, by strengthening the forest and park protection systems against forest fires and attacks of insects and tree diseases, by developing our parks and forests for recreational use, by conserving wildlife and carrying on many flood control, range rehabilitation, draining, reclamation, and other conservation projects, the CCC work programs have already added greatly to the nation's present wealth and future natural resources.

During the fiscal year 1939 (July 1, 1938–June 30, 1939) the principal results of the Civilian Conservation Corps program were as follows:

Employment furnished to an aggregate of 582,000 persons, of whom approximately 536,920 were enrolled men. Of the enrolled group, 473,832 were young men between the ages of 17 and 23 years, and 5420 were Project Assistants (age exempted); 39,168 were war veterans; 12,000 were Indians, and 6500 were Territorials. Enrollees join the Corps for a six-month period, and may re-enroll for succeeding six-month periods up to a total of two years, providing they fulfill requirements and have a satisfactory record.

More than \$72,285,000 was sent home to needy dependents by CCC enrollees during the fiscal year 1939. (Enrollees are paid a basic cash

allowance of \$30 a month of which a minimum of \$22 is required to be allotted to dependents.)

Expenditures of the Civilian Conservation Corps for the fiscal year 1939 totaled \$284,827,774.

An average of 249,768 young men per month or 91.3 per cent of the average strength received educational and practical work training. During the fiscal year 1939, more than 8936 illiterates were taught to read and write. During this period more than 31,000 enrollees left the camps to accept jobs in private industry prior to completing their terms of enrollment.

Diplomas issued to CCC enrollees were as follows: 5176 for completion of the eighth grade; 1048 for completion of high school courses; 97 for completion of college courses. CCC enrollees were awarded 763 college scholarships in 189 educational institutions. Enrollee participation in the CCC camp educational and vocational training program is as follows:

| | % | | % |
|------------------------|----|--------------------------------------|----|
| Academic | 37 | Informal | 13 |
| Vocational | 47 | Professional | 16 |
| Job Training | 65 | First Aid, Life Saving, etc. | 59 |

A brief summary of conservation work accomplished by CCC enrollees during the fiscal year 1939 is given in the following table:

| | |
|--|------------------------|
| Tree planting (forest trees) | 267,162,400 (Number) |
| Forest stand improvement | 290,272 (Acres) |
| Tree disease and insect pest control work | 1,346,426 (Acres) |
| Construction truck trails and minor roads | 8,368 (Miles) |
| Building of telephone lines | 7,429 (Miles) |
| Reduction of fire hazards | 97,783 (Acres) |
| Erection fire lookout and observation towers | 241 (Number) |
| Forest fire fighting and fire prevention and fire suppression work | 1,443,391 (Man-days) |
| Construction of check dams | 756,869 (Number) |
| Gully Control Work: | |
| Seeding and sodding | 37,877,052 (Sq. Yds.) |
| Tree Planting | 20,351,000 (Number) |
| Terrace construction | 4,240 (Miles) |
| Terrace channel construction | 7,271,883 (Linear Ft.) |
| Construction of impounding and large diversion dams | 588 (Number) |
| Construction of stock driveways | 555 (Miles) |
| Building springs, waterholes, and small reservoirs | 2,092 (Number) |
| Development fish rearing ponds | 165 (Number) |
| Planting fingerlings in lakes, ponds, streams | 145,613,606 (Number) |

J. J. McENTEE.

CIVILIAN PILOT TRAINING PROGRAM. See AERONAUTICS.

CIVIL LIBERTIES UNION, AMERICAN. An organization incorporated under the laws of New York in 1920. It fights for freedom of speech, press and assemblage wherever these constitutional rights are violated anywhere in the United States. It deals also with other guarantees of personal liberty in the Bill of Rights, and with academic freedom, censorship, and race discrimination.

It has over 5000 members and contributors, and is managed by a Board of Directors which acts under the ultimate control of policies by a National Committee numbering about 70 throughout the country. *The Civil Liberties Quarterly* is sent free to members of the Union.

During 1939, the Union interested itself in conditions in Jersey City, N. J. (see New Jersey), the right of assembly, the rights of communists, the rights of the German-American Nazis, censorship, political prisoners, etc.

The officers of the Union were Dr. Harry F. Ward, chairman and chairman of the Board of Directors, the Rt. Rev. Edward L. Parsons, Dr. Mary E. Woolley, and Lloyd K. Garrison, vice-chairmen; B. W. Huebsch, treasurer; Roger N. Baldwin, director; Lucille B. Milner, secretary. Headquarters are at 31 Union Square, West, New York City.

CIVIL SERVICE COMMISSION, U.S.

As the central personnel agency for the Federal Government, the U.S. Civil Service Commission administers the Civil Service Act of Jan. 16, 1883, the Classification Act of Mar. 4, 1923, as amended, the Civil Service Retirement Act of May 22, 1920, as amended, the Canal Zone Retirement Act of Mar. 2, 1931, as amended, and the Alaska Railroad Retirement Act of June 29, 1936, as amended.

The Civil Service Act and the civil-service rules promulgated by the President of the United States under authority of the Civil Service Act and of the act of Mar. 3, 1871, apply to the classified civil service of the executive branch, and, in some provisions, to the unclassified service. In December, 1939, the classified service included 660,594 positions, or 70.85 per cent of the 932,305 positions in the executive civil service on that date. See *GEORGIA*, *NEW YORK*.

There were 760,036 men and 172,269 women in the executive civil service in December, 1939. In the departmental service (central offices at Washington, D. C.) 39.3 per cent of the employees were women. In the field service 15.2 per cent of the employees were women; this relatively small proportion is caused by the large number of men employed in the Postal Service and in the navy yards, arsenals, and other manufacturing and construction projects.

Civil-Service Examinations. During the past fiscal year, 1,196,042 applications for civil-service examinations were received. Ratings were completed and eligible registers established in examinations for which 651,939 persons applied. Of these 566,361 took the examinations, and 261,586 received eligible ratings. The various Federal departments and establishments appointed 52,206 persons from civil-service registers.

Under the act of July 11, 1919, as interpreted by various Executive orders and court decisions, veteran preference is granted all persons discharged under honorable conditions at any time from the Army, Navy, Marine Corps, or Coast Guard.

During the fiscal year 1939, 123,806 persons applied for veteran preference in examinations. Of those who passed civil-service examinations, 31,463 had been granted veteran preference. Of the appointees to the classified service during the fiscal year, 21.89 per cent had veteran preference, including 10,933 men and 25 women receiving preference because of their own service, 381 widows of veterans, and 89 wives of disabled veterans.

Recent Legislation and Executive Orders.

On June 24, 1938, President Roosevelt issued Executive Orders Nos. 7915 and 7916, which became effective Feb. 1, 1939. Executive Order No. 7915 promulgated revised civil-service rules. Executive Order No. 7916 extended the classified service to unclassified positions not excepted by statute, required Divisions of Personnel Management to be established in the 10 executive departments and in 13 of the larger independent establishments, and authorized in-service training and competitive promotion examinations under the

supervision and co-ordination of the Civil Service Commission.

An appropriations act, Public Resolution No. 1 of Feb. 4, 1939, reduced to approximately 22,000 the number of positions included in the classified service by Executive Order No. 7916, by the withdrawal of positions financed from emergency relief funds.

On Jan. 31, 1939, the President issued revised Schedules A and B of the civil-service rules. These schedules are lists of positions excepted from examination or from competitive examination and their revision was provided for in Executive Order No. 7916. Decisions on the status of about 5000 professional, scientific, administrative, and technical positions, including many attorney positions, was temporarily postponed and the President's Committee on Civil Service Improvement was appointed to study this question. Chairman of the committee is Supreme Court Justice Stanley F. Reed.

Under the Ramspeck-O'Mahoney Act of June 25, 1938, postmasters of the first-, second-, and third-classes will be appointed without term, at the expiration of the terms of the present incumbents, in the classified service by the President by and with the advice and consent of the Senate. At the close of the session of Congress on Aug. 5, 1939, appointments to about 26 per cent of these 14,886 postmasterships had been made under the terms of this act.

The Civil Service Retirement Act was amended by Public, No. 263, of Aug. 4, 1939, effective Jan. 1, 1940. About 29,000 classified postmasters were included within the provisions of the Retirement Act, increasing the number of persons covered by the act to about 645,000. As other postmasterships are filled under provisions of the Ramspeck-O'Mahoney Act the incumbents will also be included within the scope of this Retirement Act.

HARRY B. MITCHELL.

CIVIL SERVICE REFORM LEAGUE, NATIONAL. Organized in 1881 under the leadership of George William Curtis, Dorman B. Eaton, Carl Schurz, Everett P. Wheeler, Charles J. Bonaparte, and others for the purpose of eliminating the spoils system of making appointments to public office, and for the establishment of a career system in the public service.

During 1939 the League successfully worked for passage of legislation banning political activity on the part of Federal employees; and for institution of the requirement that States sharing in Federal funds under the Social Security Act include observance of the merit system in selection of personnel in their plans of operation. A nation-wide Committee of Lawyers was organized, to arouse interest of the Bar in extension of the merit system. In co-operation with the National Municipal League (q.v.), the League drafted a model State civil service law.

Good Government is the League's official publication. The officers in 1939 were: Robert L. Johnson, president; W. W. Montgomery, Jr., chairman of the executive committee; Nicholas Kelley, chairman of the national council; Ogden H. Hammond, treasurer, and H. Eliot Kaplan, executive secretary. Headquarters: 521 Fifth Avenue, New York City.

CIVITAN INTERNATIONAL. An organization composed of selected professional and business men throughout the United States and

Canada, who have dedicated themselves to unselfish service to their city, county, State, and Nation. Its three major objectives are the "Building of Good Citizenship," "Curbing of Crime," and "Elimination of Tuberculosis." The first Civitan Club was founded in Birmingham, Ala., in 1917, the name being formed from the Latin "civitas." A total of 355 clubs had been chartered by Dec. 1, 1939.

The 1939 Convention was held in Hollywood, Calif., July 13-19. The official organ is *The Civitan* (monthly). The officers for 1939-40 were: President, Dr. J. L. Brakefield, Birmingham, Ala.; Vice presidents, Judge Allen May, St. Louis, Mo., Don Rogers, Chicago, Ill., and Fred Bauckham, Toronto, Canada; International Secretary, Arthur Cundy, Birmingham, Ala.; and International Treasurer, H. Z. Hopkins, Atlanta, Ga. Headquarters were at 800 Farley Building, Birmingham, Ala.

CLARK UNIVERSITY. A nonsectarian university in Worcester, Mass., founded in 1887. The registration for the autumn of 1939 was 418. The enrollment for the summer session was 183. There were 40 members on the faculty. The productive funds amounted to approximately \$5,000,000. The library contained 160,000 volumes. During 1939 an auditorium and an addition to the library were completed at a cost of \$250,000. President, Wallace W. Atwood, Ph.D.

CLEVELAND. See OHIO; SEWERAGE AND SEWAGE PURIFICATION.

COAL AND COKE. United States production of bituminous coal, anthracite, and bee-hive coke in 1939 are shown in Table I, with comparisons for 1938 and 1929.

TABLE I

| | 1939 (short tons) | 1938 (short tons) | 1929 (short tons) |
|----------------------------|----------------------|----------------------|----------------------|
| Bituminous ¹ | 389,025,000 | 344,630,000 | 534,989,000 |
| Anthracite ¹ | 50,807,000 | 46,099,000 | 73,828,000 |
| Bee-hive coke ² | 1,394,000 | 837,000 | 6,472,000 |

¹ Bituminous Coal Division, Dept. of Interior

² Bureau of Mines, Dept. of Interior

The coal industry in the United States staged a healthy recovery in 1939 of about 13 per cent in bituminous coal production, and 10 per cent in anthracite, compared with 1938. Bee-hive coke production, however, rose 67 per cent, reflecting increased activity in the iron and steel industry. In no case did the figures closely approach the records of 1929. The European war had little direct effect on the domestic industry. See BUSINESS REVIEW; KENTUCKY; LABOR CONDITIONS.

Stocks of bituminous coal in the hands of industrial consumers on Dec. 1, 1939, were 37,384,000 tons, an increase of 9 per cent over the preceding month and 12 per cent above the corresponding date in 1938. At the prevailing rate of consumption, industrial users held on December 1 enough bituminous coal to last 37 days.

A marked feature of soft coal mining in the United States is the rapid adoption of mechanical loading underground. According to a WPA research report issued by Commissioner F. C. Harrington, mechanical loading can displace from 10 to 40 per cent of the labor used in hand loading. It is estimated that within another decade as much as one-half of the country's soft coal

mined will be loaded underground by machine. Employment in the soft coal industry reached a peak of 705,000 in 1923, declined to a low point of 406,000 in 1932, and rose gradually to 492,000 in 1937. The industry employs as many workers as all other mineral industries combined.

British Empire output of coal remains nearly constant at 300,000,000 tons per annum, more than three-fourths of which is produced in the United Kingdom, and 90 per cent of the remainder in India, South Africa, Canada, and Australia.

H. C. PARMELEE.

COAST GUARD. The activities of the United States Coast Guard, dealing with the saving of life and property during the year ended June 30, 1939, may be summarized by stating that there were 9383 instances of lives saved and vessels assisted, this being 658 more instances than during the previous year; the total value of the vessels assisted, including cargoes, was \$63,723,566, and the number of persons on board the vessels assisted was 32,645. There were 10,615 instances of lives being saved or persons being rescued from peril, and an additional 4858 instances where assistance of one form or another was rendered.

In carrying out its functions as the Federal maritime police agency and its duties of law enforcement, the Coast Guard boarded and examined the papers of 32,655 vessels, and it seized 6 vessels. The fines and penalties incurred by vessels reported amounted to \$470,081. Coast Guard vessels removed or destroyed 266 derelicts; they patrolled 443 marine parades and regattas; and Coast Guard officers examined 3495 persons for certificates as lifeboat men.

In the hurricane which struck the New England coast in September, 1938, the Coast Guard rendered assistance with all equipment available, rescuing 1011 persons from positions of peril, and aiding 509 vessels. Emergency radio communication was provided, mail was transported, vessels and automobiles were recovered, and aerial surveys made. Three members of the Service lost their lives incident to rescue activities.

The Coast Guard provided an armed detail for the guarding and supervision of the transfer of approximately 77 million pounds of silver bullion by the Treasury Department from New York City to the depository at West Point, N. Y. Coast Guard cutters maintained the International Ice Patrol on the North Atlantic during the iceberg season, a duty to which they have been assigned since 1913, and while on this duty co-operated with the Weather Bureau in the study of the upper air conditions as a means of promoting greater safety in air navigation.

Under President Roosevelt's Reorganization Plan No. II, the Lighthouse Service, of the Department of Commerce, was transferred to and consolidated with the United States Coast Guard, in the Treasury Department. This consolidation, made in the interests of efficiency and economy, resulted in the transfer of the system of approximately 30,000 aids to marine navigation, including lighthouses, lightships, radiobeacons, fog signals, buoys, and beacons. These aids are maintained upon the sea and lake coasts of the United States, on the navigable rivers of the country, and upon the coasts of all other territory under the jurisdiction of the United States with the exception of the Philippine Islands and the Panama Canal proper. Plans were in progress at the close of the fiscal year providing for a complete

integration with the Coast Guard of the personnel of the Lighthouse Service, numbering about 5200.

The present national emergency has resulted in arduous duties incident to the maintenance of a strict neutrality patrol devolving upon the Coast Guard. To effectively carry out these additional duties Congress authorized the expansion of the enlisted strength of the Coast Guard, and the bringing of all units up to full strength. To provide for the eventuality of a continuing emergency, the number of cadets under training at the Coast Guard Academy at New London, Conn., for eventual commissioning as officers, was also increased. The establishment of a neutrality patrol necessitated a general reassignment of vessels, and certain shifts in personnel.

COFFEE. The 1938-39 coffee season in the principal producing countries, according to the International Institute of Agriculture, was characterized by weather conditions rather unfavorable to the crop and in some important areas by diseases, reducing the volume of production. The 1938-39 crop was estimated at 5011 million lb., the smallest in years except for the very low of 1935-36, and 465 million lb., below 1937-38. Brazilian production in 1938-39 approximated 3086 million lb. from 8,155,000 acres versus 3413 million lb. from 8,409,000 acres in 1937-38. The crop in other American countries was for Colombia 562 million lb., Salvador 132 million lb., Guatemala 119 million, Mexico 82 million, Cuba 68 million, and Venezuela 66 million lb.; and the total for American countries was estimated at 4314 million lb. The crop in Netherlands Indies, the leading non-American producer, was about 229 million lb.

The 1939-40 crop of Brazil, as reported by the New York Coffee and Sugar Exchange, would total about 21,861,000 bags versus 21,873,000 bags in 1938-39; the respective world totals in these years were 32,361,000 and 32,017,000 bags. The world visible supply in December, 1939, amounted to 8,162,812 bags. In Brazil, 8,628,749 bags had been pledged against the 1939-40 coffee loan, and coffee destroyed from July 1, 1938, to Dec. 15, 1939, totaled 6,207,000 bags. The total destroyed to Dec. 31, 1939, amounted to 68,253,000 bags, not including 479,000 bags destroyed before June 1931 by São Paulo Institute. Receipts at ports from interior Brazil were 17,102,000 bags in 1938-39. Exports from Brazil totaled 16,840,000 bags, and from Colombia 4,094,388 bags. Deliveries in the United States amounted to 13,817,107 bags in 1938-39, and in Europe 11,598,000, and the total world delivery 26,727,100 bags. New York spot prices (January-December) in 1939 averaged from 6 to 7¼¢ per lb. for Santos No. 4 and 8¼ to 12¾¢ for Colombian.

COLBY COLLEGE. A nonsectarian college for men and women at Waterville, Me., founded in 1813. The enrollment for the autumn term of 1939 was 682. The faculty numbered 53. The endowment amounted to \$2,765,705. Total income was \$569,294, of which \$117,264 was from interest on

investment, \$270,000 from student fees and sundry, and \$182,030 from gifts. The library contained 96,000 volumes. President, Franklin W. Johnson, L.H.D., LL.D.

COLCHICINE. See BOTANY.

COLGATE UNIVERSITY. A nonsectarian institution for the higher education of men in Hamilton, N. Y., founded in 1819. In the autumn of 1939, there were 1094 students enrolled. The faculty numbered 107 members. The productive funds amounted to approximately \$6,555,000, and the income for the year \$732,000. The library contained 110,000 volumes. President, George Barton Cutten, Ph.D., LL.D., D.D., Pd.D., L.H.D.

COLLIER, BARRON. An American capitalist, died in New York, Mar. 13, 1939. Born in Memphis, Tenn., Mar. 23, 1873, he attended the public schools there, and got a job with an advertising firm at the age of seventeen. Ten years later (1900) he left for New York where he established Barron G. Collier, Inc., an advertising firm which subsequently controlled advertising in the New York subway, elevated, and surface lines. Successful, he branched out into other fields and accumulated a fortune through realty, banking, and contracting. At his death he was president or director of a score of companies, including Broadway Surface Advertising Corporation, Street Railways Advertising Co., etc.

Active in civic affairs, particularly in police work, Mr. Collier was a special deputy police commissioner in charge of the Bureau of Public Safety, New York (1922-25) and was interested in the work of the International World Police and the International Association of Chiefs of Police. He served as acting director of the Boy Scout Foundation of Greater New York during 1932-37. Mr. Collier established a residence in Florida and his large real estate holdings there led him to develop the West Coast of that State. He organized the Florida Gulf Coast Hotels, Inc., and Collier Florida Coast Hotels, Inc.

COLOMBIA. A South American republic, third in area and population among the states of that continent. Capital, Bogotá.

Area and Population. Area, about 448,794 square miles; population at the census of July 5, 1938, 8,724,839 (7,851,000 at 1928 census). There were 27,437 foreigners in January, 1939, of whom 16.6 per cent were Venezuelans, 13.3 per cent Germans, 8.3 per cent Spaniards, and 7.7 per cent United States citizens. Living births registered in 1938 numbered 277,800 (31.8 per 1000); deaths, 150,268 (17.2); marriages, 42,605 (4.9). The 1938 census populations of the chief cities were: Bogotá, 331,400; Medellín, 170,622; Barranquilla, 152,348; Cali, 110,579; Manizales, 86,346; Cartagena, 86,197; Ibagué, 61,860; Cúcuta, 57,251.

Defense. Military service is compulsory, the conscripts being called to the colors for one year at the age of 21 and then serving in the reserve until 30. The army's peace strength is about 10,000 men; war strength, about 50,000. Defense equipment includes about 15 airplanes, 2 modern destroyers, 1 seagoing gunboat, 3 coastguard patrol vessels, and 4 river gunboats. See *History*.

Education and Religion. In 1939 there were nearly 9200 primary schools, with over 600,000 pupils; 376 secondary, 25 vocational and 11 commercial schools; one national and three regional universities and six additional institutes offering courses of university grades. Students in all secondary schools and universities numbered 73,000. Primary education was available to only about one-third of the children of school age. The great majority of Colombians belong to the Roman Catholic Church, which was disestablished as the state church in 1936.

Production. The production of raw materials and foodstuffs for export is the basis of the national economy. Coffee, petroleum, gold, and bananas accounted for 94.2 per cent of the 1938 exports. Colombia is the world's chief source of mild coffee and ranks second to Brazil in total production. Estimated yields of the chief crops were (in metric tons): Coffee, 255,000 in 1938-39; cacao, 11,400 in 1937-38; cane sugar, 51,000 in 1938-39; tobacco, 14,800 in 1937-38; rice, 74,600 in 1936-37; wheat, 90,800 in 1937-38; corn, 490,500 in 1937-38. Livestock (1937): 9,167,455 cattle, 1,018,267 horses, 1,865,185 swine, 913,993 sheep, 815,923 mules and asses. Mineral production in 1938 included: Petroleum, 21,576,016 bbl.; gold, 520,698 fine oz.; salt, 78,000 metric tons; silver, 6 metric tons; platinum, 25,486 fine oz. (10 months). Manufacturing is confined largely to fabrication for local consumption (chiefly textiles, flour, cigars, and cigarettes) and oil refining.

Foreign Trade. Imports in 1938 totaled 159,259,000 pesos (169,684,000 in 1937); exports, 168,637,000 (184,187,000). Values of the chief 1938 exports (in pesos): Coffee, 94,160,000; petroleum, 37,206,000; gold, 18,780,402; bananas, 8,684,000; cattle hides, 3,876,000. The United States supplied 49.9 per cent of the 1938 imports (46.5 in 1937); Germany, 17.4 (13.2); United Kingdom, 11.1 (17.4). Of the exports, the United States took 59 per cent (64.1 in 1937); Germany, 12.8 (10.3); Curaçao, 10 (10.1).

Finance. For the calendar year 1938 ordinary, extraordinary and miscellaneous receipts including loans, etc., but excluding the surplus from 1937, totaled about 88,989,000 pesos and ordinary and extraordinary expenditures about 94,423,000 pesos. The 1939 budget estimated revenues and expenditures at 89,249,000 pesos. The ordinary budget for 1940 balanced at 86,106,000 pesos; special purpose budget, at 2,745,000 pesos; special budget for repayment of 1932 defense loan, at 2,775,000 pesos.

The public debt on Dec. 31, 1938, totaled about 186,310,000 pesos (188,776,000 on Dec. 31, 1937). Exchange rates of the Colombian peso in 1938: Controlled, \$0.5586 (\$0.5450 in 1937); curb, \$0.5435 (\$0.5494).

Transportation. There were 1918 miles of railway line in operation in 1938; 84 miles of line were under construction in 1939. Highways extended 14,637 miles (1939) and 190 miles were under construction. In 1938 about 3,600,000 tons of cargo were moved by rail and 849,000 tons on the Magdalena River. Operating statistics of the "SCADTA" (Colombian-German Air Transport Co.) for 1938: Miles flown, 2,154,279 (1,812,294 in 1937); passengers, 54,969 (42,590 in 1937); air mail, 140,655 lb. (117,495); total pay load, 11,913,053 lb. (8,902,100). Colombia also is served by the Pan American Airways.

Government. The Constitution of Aug. 5, 1886, vests executive power in a President elected

for four years by direct popular vote and ineligible for re-election for four years after completion of his term. A Congress of two houses exercises the legislative power. The Senate has 56 members, elected for 4 years by departmental assemblies; the Chamber of Deputies, 118 members, elected for 2 years by direct suffrage. Extensive amendments to the Constitution were voted in 1936 (see 1936 YEAR BOOK, p. 174 f.). President in 1939, Dr. Eduardo Santos (Liberal), who assumed office Aug. 7, 1938. The Conservatives abstained from voting in the 1935 and 1937 elections with the result that both houses of Congress were composed entirely of Liberals of various shades of opinion.

HISTORY

Parliamentary Elections. The annual convention of the Conservative party at Bogotá voted on Feb. 7, 1939, to participate in the biennial congressional elections, thus ending the boycott policy adopted during the 1935 and 1937 elections. The election of March 19 was one of the most orderly and free in Colombian history. The Liberals captured 76 seats in the Chamber of Deputies against 42 for the Conservatives. The Liberals also won majorities in each of the 14 departmental assemblies, with the result that the new Senate chosen by the departmental assemblies in April was composed of 39 Liberals and 19 Conservatives. The Liberals in March had captured control of four departmental assemblies formerly dominated by the Conservatives. They continued their sweep of the polls in the municipal elections of October 1, winning about 600 of the 800 contested offices.

The national convention of the Liberal party, held in Bogotá July 15-19, was marked by the resumption of the struggle between Left and Right wing groups headed by ex-President Alfonso López and the supporters of President Santos, respectively. A new directorate was chosen consisting of ex-President López, Minister of Government Carlos Lozano, Gabriel Turbay, former chairman of the directorate; the Leftist leader Jorge Gattán, Col. Luis Cano, and Lucas Caballero, former Minister to the Central American republics. Most of them were supporters of the policies of Dr. López.

Congress and Legislation. In accordance with the constitutional amendment voted in 1938, Congress met for its annual five-months' session on July 20. In his message inaugurating the session, President Santos reported a substantial improvement in the economic and financial situation, urged constitutional reforms to secure the independence of the judiciary, and mentioned the improved relations between the state and the Roman Catholic Church. He emphasized the need for technical progress in strengthening the air service and other departments of national defense. As to foreign policy, President Santos declared that his country would take steps to prevent the safety of the Panama Canal from being threatened from its territory. He said that the government was anxious to resume service on its foreign loans on the basis of its real capacity to pay. Negotiations for a readjustment of the dollar debt were continued during the year with the Foreign Bondholders Protective Council of New York, but no agreement on terms for the resumption of interest and amortization payments was reached.

The government placed upon the newly estab-

lished territorial credit banks the additional task of making long term mortgage loans for the construction of dwellings for agricultural workers. The influx of Jewish and other refugees from Europe led the government on March 14 to establish the Immigration and Colonization Committee to formulate a permanent immigration policy. On May 16 all immigration of Jewish, Czech and Spanish refugees was suspended. Some 3500 Jews had entered Colombia in the preceding eight months and applications for entry had been made by 5000 more. The government's action was forced by the increasing protests of Colombian merchants and professional men against the competition of the newcomers. Another decree of March 10 established the National Cost of Living Commission to prevent an undue rise in the cost of prime necessities. A bill to give the President extraordinary powers until July, 1940, was introduced by seven Cabinet Ministers on December 5.

Public and Private Works. The National Railways Administrative Council in 1939 commenced the construction of a number of government-operated hotels to stimulate the tourist trade. Other public works completed during the year included the new port of Barranquilla, a 27-mile section of the Pacific Railway, and a number of important highways. The construction of additional schools and reorganization of the educational system was continued. Recommendations for curbing alleged anti-government political propaganda in Catholic schools conducted by the Christian Brothers' order were submitted to the cabinet on May 21. The government initiated a reforestation programme.

Of exceptional economic importance was the opening at the end of September of a 250-mile oil pipe-line, with a parallel highway, built by the Gulf Oil Company from the rich Catatumbo fields near the Venezuelan border across a high range of mountains to the Caribbean at Puerto Covenas. There a harbor for the exportation of petroleum was constructed and a refinery was to be built. The pipe-line was expected to yield the Colombia Government royalties of \$1,160,000 during the first year of operation, during which it was expected to handle only one-third of its ultimate capacity.

Foreign investments in petroleum and other mining enterprises were encouraged by the Santos Government despite demands in radical circles for either nationalization or heavy taxation of mining properties. Mining shares on the Bogotá exchange dropped sharply on May 10 when the Council of State ordered the return to the national reserves of alluvial gold workings on the Telembi River operated under a concession by a subsidiary of the Choco Pacifico Mining Co. of New York. However this decision was reversed by the Supreme Court of Colombia, which on July 19 upheld the company's title. The latter decision was considered an important precedent in affirming the validity of existing titles to mining properties.

Foreign Relations. After a debate on foreign policy indicating the existence of widespread Nazi propaganda, working through Spanish Fascist organizations and some elements of the Conservative party, the Chamber of Deputies on August 23 approved the government's policy of "close understanding with American nations and harmonious collaboration with the Good Neighbor policy of the President of the United States, based on international juridical equality and unity

of action in defending this continent and democracy."

Additional evidence of close United States-Colombian collaboration in defense of the Panama Canal and the principle of hemisphere solidarity was seen in the visit of Gen. David L. Stone and a group of other high army officers from the Canal Zone to Bogotá early in July. After the outbreak of the European war, the State Department at Washington was reported to have objected to the employment of some 20 German pilots, understood to be reserve officers of the German air corps, by the SCADTA air system. The Bogotá authorities on their own initiative had taken steps to prevent a possible air raid on the Panama Canal by the German pilots.

In line with proposals made by President Santos in July, the German-Colombian SCADTA Co. was merged with the Colombian-owned Saco Company on October 26, placing all internal air lines under Colombian control. The new company (Colombian Air Navigation Co.) employed Colombian and United States pilots. On September 2 President Santos in a message to all American governments suggested immediate application of the Pan American conventions to safeguard the neutrality and independence of the hemisphere. This step led to the convocation of the conference of Foreign Ministers in Panama (see PAN AMERICANISM; PAN AMERICAN UNION).

Friction with the Franco Government in Spain also developed during the year. The Franco decree providing for the establishment of Falangist (Fascist) units among Spanish immigrants in Latin America led President Santos to declare on July 20 that "the intention of establishing centers or branches of foreign political organizations will be considered unfriendly acts, whatever the politics of the group." A month earlier considerable indignation was aroused by the demand of Franco's Minister in Bogotá for retraction of an article in the newspaper *Liberal* concerning executions in Spain. The Minister had not yet presented his credentials. Mass meetings were held throughout the country demanding the Minister's expulsion and even the pro-Franco Conservative press criticized the Minister's action. A treaty of non-aggression, conciliation, arbitration and juridical procedure was signed with Venezuela on Dec. 17, 1939.

See ARGENTINA under *History*.

COLONIZATION. See ALASKA.

COLORADO. Area and Population. Area, 103,948 square miles; included (1930) water, 290 square miles. Population: Apr. 1, 1936 (census), 1,035,791; July 1, 1937 (Federal estimate), 1,071,000; 1920 (census), 939,629. Denver, the capital, had (1930) 287,861 inhabitants; Pueblo, 50,096.

Agriculture. Colorado harvested, in 1939, 4,910,400 acres of principal crops: This was about five-sixths of the total for 1938 and six-sevenths of the average for 1928-37. Tame hay, on 1,037,000 acres, made 1,537,000 tons (\$13,987,000, estimated farm value); wheat, on 1,072,000 acres, 12,217,000 bu. (\$7,452,000); sugar beets, 145,000 acres, 1,539,000 tons (value of the previous crop, that of 1938, estimated at \$8,344,000); potatoes, 90,000 acres, 14,400,000 bu. (\$9,360,000); corn, 766,000 acres, 8,043,000 bu. (\$4,906,000); dry beans, 272,000 acres, 1,360,000 100-lb. bags (\$4,537,000); barley, 388,000 acres, 7,566,000 bu. (\$3,405,000); oats, 145,000 acres, 4,205,000 bu. (\$1,514,000).

Manufacturing. Establishments engaged in

manufacturing in Colorado in 1937 numbered 1233 (in 1935, 1160); employed 25,932 wage-earners (in 1935, 20,858); and paid wages totaling \$31,753,039 (in 1935, \$21,530,164). To their output of goods, attaining \$237,838,370 (for 1935, \$171,350,403), they contributed by manufacture \$92,103,247 (in 1935, \$63,588,385). Meat-packing produced goods to the total of \$39,805,919 in 1937.

Mineral Production. Colorado's yearly production of native minerals totaled \$67,338,548 for 1937, according to the most recent estimate of the Bureau of Mines. Coal contributed the highest stated component to this total; molybdenum, for which the total yearly production by value was not given for this State, apparently rivaled coal as the year's leading product, but still ranked second; gold was third, silver fourth in importance. The mining of coal decreased to about 5,676,000 net tons for 1938, from 7,187,000 for 1937 (value, \$18,327,000). Molybdenum, of which the Climax Molybdenum Company was the State's single producer, was mined in 1938 to the total of 28,242,085 pounds of metal in the form of the sulphide, as against 22,750,368 pounds for 1937. The total for 1938 came to some 84 per cent of the production of the whole Union. Mines shipments of molybdenum in 1938, lower than their production were reckoned to total \$17,977,000 in value, of which much the greatest part was ascribable to Colorado. The output of petroleum, produced in moderate quantity, diminished to about 1,412,000 barrels for 1938, from 1,605,000 barrels (value, \$1,800,000) for 1937.

The yearly value of the production in Colorado of gold, silver, copper, lead, and zinc, about \$22,245,979 for 1939, slightly exceeded that for 1938, of \$22,073,663. The mines' output of gold was about 364,719 ounces for 1939, as against 367,468 for 1938; by value, \$12,765,165, as against \$12,861,380. That of silver rose to some 8,393,642 ounces (1939) from 7,932,095 (1938); by value, to \$5,697,502, from \$5,127,819. That of copper declined in quantity to about 26,828,000 pounds (1939), from 28,342,000; while the total by value, \$2,790,112 for 1939, approximated that of \$2,777,516 for 1938. The minor production of zinc and of lead fell below that of 1938.

Education. Colorado's inhabitants of school age were stated to number 312,715 (from 6 years to 21) in 1939. Enrollments of all pupils in public schools totaled 233,141; this comprised 157,548 in the elementary group, 53,560 in high schools, and 22,033 otherwise listed. The year's expenditures for public-school education totaled \$23,017,216 and included \$17,795,571 of current expense. Teachers, numbering 9207, averaged \$1248.51 in yearly salary.

Legislation. The regular session of the 32d General Assembly, convening January 4 and closing April 28, had as its most urgent concern the need to divert revenue from existing but already allotted sources into the State's general fund, sustaining many old and indispensable services. Governor Carr, taking office, proposed that the previous Legislature's grant of the State's income tax toward the support of the public schools should be rescinded, in order that the State might meet "just as great an obligation" to the sick and dependent. Although the supporters of the public schools were powerful in the Legislature, it eventually assigned to the State's general fund 65 per cent of the proceeds of the income tax, reducing the schools' share to 35 per cent. The State's temporary tax on paid services, due to

expire June 30, was made to continue for two years thereafter, for further aid to the general fund; amendments lifted this tax from certain services, in response to agitation for terminating the "tax on human suffering"; these were services rendered by doctors, dentists, undertakers, nurses, and some others. The power of distraint was granted to the collectors of the sales tax, as a means of bringing payments of this tax into closer conformity with liability.

Critics of the Assembly held that it turned its back on the proposed reorganization of the over-many and ill-correlated branches of the State government. A carefully prepared study of this need and of ways to deal with it, existed in the Griffenhagen report; reorganizing bills were introduced in either house, only to rest in committee. Appropriation measures, as signed by the Governor, totaled \$11,233,766, which exceeded by less than half of 1 per cent the estimated revenue of the general fund for the biennium; he had pared the appropriations down from higher totals passed by the session. Miscellaneous enactments included the creation of a system for the settlement of fines for drivers' minor offenses by payment to the State's Motor Vehicle Department, without proceedings in court; the requirement that physicians test the blood in pregnancy, for sign of venereal disease; tests to the same purpose as prerequisite to a marriage certificate; and provision for a legislative investigation of un-American activities in the State.

A brief special session followed the regular session; it dealt with charges against two members of the State Civil Service Commission, Herman C. Getty and Mrs. Clara C. Wilkins. The charges, having to do with alleged levies on applicants for places in the State's service, were dismissed.

Political and Other Events. Governor Carr, inaugurated January 10, made his inaugural address the occasion for advocating many of the reforms proposed some time before, in the Griffenhagen Report, as needful in the improvement of the structure of the State government; he was unable to induce the Legislature to enact a number of bills for effecting such changes; with difficulty he prevailed in a struggle for the adoption of taxes that would approximately cover the expenditure for the general purposes of the State government, not specially assured by revenue from earmarked sources. His administration made unusual efforts to collect in full the taxes due, invoking the power of distraint of the goods of delinquent payers of the sales tax. The State was reported to have ended the fiscal year June 30 without current deficit; this was ascribed to success in making greater collections of existing taxes applicable to the general fund. The payments of the State's old-age assistance continued as provided by constitutional amendment, but the monthly rate varied widely with the tide of the income from the taxes particularly segregated to this use. For January the awards of pension averaged \$39.93; from this the State deducted \$8 because of insufficiency of allotted funds, and the average of actual payments was therefore \$31.93.

The State's compact with Texas and New Mexico, for the division among the three of the right to use the waters of the Rio Grande River, received Federal approval May 31; representatives of the three States had signed it in 1938 and all three had subsequently given it legislative ratification. Differences with Wyoming over waters of the Laramie River arose in June, persons in Colo-

rado having broken the fastenings of headgates closed under court order after the taking of the maximum quantity of water; State authorities, failing to stop the taking of water were cited for contempt of the U.S. Supreme Court's decree. The State Civil Service Commission became involved during September in discords among the members and seemed unable to proceed with business; the Governor proposed that the members resign, but his counsel was not followed.

Railroads in Colorado were extensively involved during the year in litigation and in proceedings before administrative bodies, with regard to taxes and proposed abandonments of lines. The State Tax Commission had raised the taxes of railroads by virtually 20 per cent in 1938. Some of the companies remained delinquent as to payment of taxes that they had been unable to meet in years of great adversity. Lines that might under better conditions have been seized and sold by taxing bodies to meet companies' fiscal liability were in some cases the ones that companies wanted to abandon in order to reduce unprofitable operation. The railroads contesting the increase of their taxes imposed in 1938 sued in the Federal courts; a District Court's decision in their favor was overruled by the Circuit Court, which held (August 22) that the companies should first have exhausted the possibility of recourse to the State courts. The Colorado and Southern Railway abandoned in February a piece of line running from Idaho Springs to Silver Plume, including a metal trestle 303 feet long, over Clear Creek, formerly a noted work of engineering. The Denver and Rio Grande Western, long in receivership, was the subject of a plan of reorganization approved by the Interstate Commerce Commission, but as this plan favored the claim of the Reconstruction Finance Corporation, to the disadvantage of other leading creditors, a committee of these proposed an alternative surrendering to the Corporation the Denver and Salt Lake line and thus abandoning the operation of the Moffat tunnel and the Dotsero cut-off, which had been built at great expense to give Denver its connections beyond the continental divide. The State's programme of highway-building did not accord with the requirements of the Federal Bureau of Public Roads, which called upon Colorado to construct a highway through Clear Creek Canyon. After reported Federal intimation that the State might not be found qualified for U.S. road aid, the State's willingness to proceed with the Clear Creek work was expressed.

Work on the Green Mountain dam and tunnel, part of the Colorado-Big-Thompson system of structures for the impounding and diversion, through the mountains, of water, was interrupted in July and August by a severe strike. Governor Carr sent a force of the National Guard to the scene August 3, after four men had been wounded in a shooting-encounter. The contracting company granted the union-shop system August 22, to the striking unions, connected with the AFL.

In Denver the municipal Housing Authority undertook the construction of a group of dwellings for 718 families of slum-dwellers, at an expected cost of \$3,500,000. Railroads entering Denver combined in a plan to build a market on Wazee Street; the city was asked to lease and operate the market at its completion. Denver adopted a municipal tax on cigarettes, at a cent a package, to go into effect Jan. 1, 1940; the State's Treasurer thereafter asserted, December 13, that the State, in virtue of the old-age-pension amendment,

would claim 85 per cent of the proceeds and that the tax, once in effect, could not be repealed. The city council moved for the repeal of this and of other new taxes likely to be claimed in part by the State. The neighborhood of Denver experienced what was called the dryest year since 1872; only 7.58 inches of rain (6.47 inches below average) were reported to have fallen in 1939.

Colorado Springs announced the retirement October 1 of the last of the debt on its municipally owned system for purveying gas and electric current; the system was said to have retired \$2,200,000 of bonds since its start in 1926, and to have made yearly contributions to municipal revenue: for 1938, \$180,000, or 28 per cent of such revenue. At Cripple Creek a celebration (September 4) marked the dedication of the Carlton Tunnel, then in course of construction by private enterprise, and designed on its completion by 1942 to drain deep levels of mines extending under about 30 square miles of the Cripple Creek area.

At Caddoa, in Bent County, the start of work on the construction of the Caddoa Dam was celebrated, October 13, with a barbecue and speeches by Governor Carr and others. The Caddoa Dam was to be built by the Army Engineers at an expected cost of \$15,000,000, to bar the Arkansas River with an earthen dike 120 feet higher than the lowest part of the river-bed and 13,000 feet long. The resulting reservoir was to supply water for irrigation and to hold back floods.

Officers. Colorado's chief officers, serving in 1939, were: Governor, Ralph L. Carr (Rep.); Lieutenant-Governor, John C. Vivian; Secretary of State, George E. Saunders; Auditor, Homer F. Bedford; Treasurer, Charles M. Armstrong; Attorney-General, Byron G. Rogers; Superintendent of Public Instruction, Inez Johnson Lewis.

COLORADO, UNIVERSITY OF. A coeducational State institution of higher learning in Boulder, Colo., founded in 1876. The number of students enrolled for the autumn of 1939 was 4166; the summer session enrollment was 3741. There were 281 faculty members. The total income for the year was \$2,158,904. The library contained 293,833 bound volumes, 5271 pamphlets, and 310 maps. A new library building is under construction. President, Robert L. Stearns, B.A., LL.B.

COLUMBIA UNIVERSITY. A nonsectarian institution for the higher education of men and women in New York City, founded as King's College in 1754. At Morningside Heights, Broadway, and 116th Street are located: Columbia College (for undergraduate men); Barnard College (for undergraduate women); Teachers College, including the Advanced School of Education; the professional schools of law, engineering, architecture, journalism, business, library service, and optometry; and nonprofessional graduate faculties of political science, philosophy, and pure science. The College of Physicians and Surgeons and the School of Dental and Oral Surgery are at the Medical Center on West 168th Street, the College of Pharmacy on West 68th Street, Bard College at Annandale-on-Hudson, N. Y., and the New York Post-Graduate Medical School on East 20th Street. In addition, through university extension classes and the summer session, courses

are offered for resident students at Morningside Heights; and other courses are offered at Camp Columbia, as well as at several centres.

On the basis of the enrollment on Nov. 1, 1939, the total number of resident students for the year was estimated at 31,032, distributed as follows: Undergraduates, 2932, of whom 1801 were in Columbia College, 991 in Barnard College, 101 in Bard College, and 102 in other schools; and graduate students, 2857. The distribution of professional students was as follows: Law, 516; medicine, 682; engineering, 308; architecture, 57; journalism, 65; business, 540; dental and oral surgery, 282; pharmacy, 246; optometry, 92; library service, 507; and Teachers College, 7502; 5013 students were enrolled in university extension classes. 3100 were registered in special and extramural courses as nonresident students. There were 11,950 students registered for the summer session of 1939. The grand total of resident students is exclusive of 2580 duplicate registrations.

The faculty and officers of administration in 1939-40 numbered 3361, of whom all but 105 were in active service. This number was distributed as follows: Professors, 410; associate professors, 215; assistant professors, 349; associates, 213; instructors, 394; lecturers, 113; assistants, 306; curators, 5; associates, instructors, lecturers, and assistants in Teachers College, 192; associates, instructors, lecturers, and assistants in the College of Pharmacy, 15; associates, instructors, and lecturers in Bard College, 17; instructors in extension, not included above, 479; instructors in summer session, not included above, 441; officers of administration, 107; emeritus and retired officers, 105.

During the year 1938-39 the university received gifts in money representing a total of \$1,392,279.72. The principal gifts were: \$50,000 from the Carnegie Corporation for graduate medical instruction and research; \$173,000 from the estate of Mary B. Pell for general endowment; \$171,000 from the estate of William Campbell, for the Campbell (William) Fellowship in Scientific Research; \$183,000 from the estate of Benjamin N. Cardozo for the Cardozo (Benjamin N.) Fund to establish a chair in jurisprudence in the Law School; \$53,000 from the estate of Mary Purroy Mitchel for the Mitchel (John Purroy) Memorial Fund; \$171,000 from the Rockefeller Foundation for various special purposes.

The capital endowment of the university in 1939, excluding value of plant (including Barnard College, Teachers College, College of Pharmacy, Bard College, and New York Post-Graduate Medical School), was \$87,068,335. The estimated total resources as of June 30, 1939, were \$158,314,167. The annual budget for 1939-40 was \$11,292,700. The library contained 1,662,883 volumes. President, Nicholas Murray Butler, Ph.D., Hon.D., LL.D.

COMMERCE. See BUSINESS REVIEW; FEDERAL TRADE COMMISSION; IMPORTS AND EXPORTS; INTERSTATE COMMERCE COMMISSION; sections on *Foreign Trade* under the various countries.

COMMERCE, U.S. DEPARTMENT OF. Harry Lloyd Hopkins of Iowa was Secretary of Commerce during 1939. Edward J. Noble was appointed to the post of Under Secretary, which was created by Act of Congress in June. By the

administrative reorganization of July 1 (see under UNITED STATES), the division of foreign commerce was removed from the Department's Bureau of Foreign and Domestic Commerce and transferred to the Department of State.

The Department of Commerce continued, however, as the direct contact between the Government and American business as regards the determination of information to be obtained abroad and the analysis and dissemination of such information in the United States. Requests in connection with trade promotion and economic matters were still to be directed to the Bureau of Foreign and Domestic Commerce, as formerly. In July Secretary Hopkins appointed George Wythe to act as liaison officer between the Departments of Commerce and State.

As a result of the reorganization, the Bureau of Fisheries (q.v.) was placed under the Department of the Interior, the Lighthouse Service (q.v.) under the Treasury Department, and the Federal Employment Stabilization Office under the National Resources Planning Board in the President's Executive Office. At the same time, the Department took over the Inland Waterways Corporation, formerly an independent agency incorporated by the Secretary of War.

Steps were taken during the year to establish a clearing house in the Department of Commerce for business research activities throughout the nation, and a program of co-operation with universities in business research was introduced. Late in the year, Secretary Hopkins announced the formation of an Interdepartmental Committee to study and co-ordinate Government activities in combatting interstate trade barriers. For expenditures of the Department, see the table under PUBLIC FINANCE. Separate articles in this volume are devoted to the following divisions: CENSUS, BUREAU OF THE; PATENT OFFICE.

COMMERCIAL BUILDINGS. See ARCHITECTURE.

COMMODITY CREDIT CORPORATION. A United States government agency, formerly independent, integrated into the Department of Agriculture on July 1, 1939. The Commodity Credit Corporation is primarily a lending institution, making loans principally to producers to finance the carrying and orderly marketing of agricultural commodities. It was created as an agency of the United States on Oct. 17, 1933, by executive order, and its functions have been extended from time to time. On Mar. 4, 1939, its functions were extended to June 30, 1941, or such earlier date as may be determined by the President. The Corporation has a paid-in capital of \$100,000,000 and is authorized, with the approval of the Secretary of the Treasury, to have outstanding at any one time obligations aggregating up to \$900,000,000. See AGRICULTURAL ADJUSTMENT ADMINISTRATION; AGRICULTURE.

On Sept. 15, 1939, the Commodity Credit Corporation reported that it had disbursed since its inception a total of \$1,229,216,493, of which \$435,600,264 was outstanding. Loans held by the Cor-

| Commodity | Dollars | Commodity | Dollars |
|-------------------------|-------------|--------------------|------------|
| Cotton | 727,905,698 | Raisins | 3,780,889 |
| Cotton Pool | 51,415,842 | Wheat | 50,766,866 |
| Corn | 305,245,243 | Wool, Mohair | 3,334,840 |
| Tobacco | 9,639,384 | Butter | 34,376,958 |
| Turpentine, Rosin | 25,359,448 | Dates | 61,302 |
| Figs | 208,913 | Pecans | 440,649 |
| Peanuts | 12,473,860 | Hops | 1,456,709 |
| Prunes | 2,751,893 | | |

poration totaled \$218,769,727 and loans held by banks through arrangement with the Corporation totaled \$216,830,537. As a result of its operations the Corporation owned on the above date 6,921,372 bales of cotton, 4,267,467 bu. of corn, and 10,663,015 bu. of wheat. The total disbursements, by commodities, as reported on Sept. 15, 1939, are shown in the accompanying table.

Carl B. Robbins was named President of the Corporation in August, 1939, succeeding Lynn P. Talley.

CARL B. ROBBINS.

COMMUNISM. The conclusion of the German-Soviet non-aggression pact of Aug. 24, 1939, and the subsequent sensational reversals of Soviet policy that followed Joseph Stalin's formal rapprochement with Adolf Hitler, profoundly affected the program and influence of the Third International (Comintern) and of the Communist parties in the various countries of the world.

Upon the announcement of the German-Soviet pact, the Comintern overnight abandoned the "party line" adopted by its Seventh Congress in 1935 (see 1935 YEAR BOOK, p. 160 f.), and the Stalinist Communist party organizations throughout the world immediately followed suit. The annual appeals to the workers of the world issued by the Comintern on May Day and on November 7 showed the extent of this tactical somersault.

The May Day appeal was issued while the Soviet Union was still seeking to rally world support against the double threat of German and Japanese aggression and while Moscow was striving to enlist Britain and France in a defensive pact on Soviet terms. Accordingly it called upon the workers everywhere to "demonstrate together with the workers of France and England against war arsonists, for a decisive rebuff to fascist aggressors and for application of military, economic and political sanctions against them." It continued:

You will demand from the bourgeois governments of England, France and the United States aid for the republicans of Spain, for the patriots of Czecho-Slovakia, Albania and Abyssinia and for the democrats of Austria to free them from the foreign yoke. . . . You will demonstrate for a united front of the workers of the whole world with the great country of socialism.

The appeal of November 7 was issued after the Soviet-German pact had paved the way for the German conquest of Poland, helped to embroil France and Britain in war with the Reich, and enabled Moscow to annex half of Poland and establish its undisputed control over the Baltic states. It was the general conviction of Soviet leaders that the war between the capitalist states would temporarily eliminate danger of an anti-Soviet coalition and provide a great impetus toward the expansion of communism. This conviction was expressed by the Old Bolshevik, Emil Yaroslavsky, in the Moscow *Bolshevik* of November 15.

Consequently the Comintern's November manifesto revived the pre-1935 summons to a world revolution against "imperialism, war, capitalism, and profiteering." It called upon the workers of Britain, France, and Germany to oppose the war; denounced Social Democrats and liberals in

the democratic countries for supporting the war against Germany; repudiated the former Communist united front policy; and attacked the American repeal of the arms embargo. The Comintern's interpretation of the war and of Soviet policy toward it was set forth as follows:

This war is the continuation of many years of imperialistic struggle in the camp of capitalism. Three of the richest States—Great Britain, France and the United States—dominate the most important world routes and markets of raw materials. They hold in subjection more than half of mankind.

Exploitation of toilers and exploitation of oppressed colonial peoples are covered with the hypocritical flag of democracy in order more easily to deceive the masses.

Against their world domination struggle other capitalist States who have lately entered the arena of colonial expansion.*** They wish to redistribute in their favor the sources of war materials, foodstuffs, gold reserves and human masses of the colonies. Such is the true meaning of this war, an unjust, reactionary, imperialist war.

In this war, all the capitalist States and above all the ruling classes of the belligerent States, are guilty. The working class cannot support such a war. Communists have always combatted such wars.

The Soviet Union has waged a tireless struggle for the preservation of peace for more than a score of years. The bourgeois governments have continued their silent policy of isolating the U.S.S.R.

Even when it was clear to everyone that war was already inevitable, the Soviet Union made a last attempt to save peace. It agreed to negotiations with the governments of Great Britain and France.

But the war provocateurs sought something else. They sought to utilize negotiations to lull the vigilance of the masses and to rid themselves of responsibility for a war that had already been prepared by them.

They instigated Poland against the land of the Soviets. While conducting negotiations with the U.S.S.R., they sought on the sly to goad Germany against the Soviet Union.

By concluding a non-aggression treaty with Germany the Soviet Union disrupted the crafty plans of the provocateurs of an anti-Soviet war. By this treaty it has placed its peoples outside the range of the carnage and narrowed the arena of fire of the European war.

By its appeals for cessation of the war and by its treaty of friendship and border delimitation with Germany, the Soviet Union introduces a new element into the cause of peace.

Advances of Communism. As a result of the outbreak of the European war, the Stalin variety of communism achieved some advances during 1939. The eastern half of Poland, annexed by the Soviet Union, was sovietized. The small Baltic states were forced to accept Russian domination and their sovietization was expected to follow in due course. A violent attack was launched upon bourgeois, capitalist democracy in Finland. The Russian advance into Poland placed communism in a much more advantageous position for expansion into southeastern Europe.

Moreover, the financial cost of the war was rapidly undermining private property and the other bases of middle-class society in Britain and France, and destroying the remnants of capitalism in Germany. The European and Chino-Japanese wars enabled Moscow to speed up the sovietization of Sinkiang and strengthen its influence over the provinces of northwest China controlled by the Chinese Communists. At the year end there were persistent reports that Soviet troops were preparing to carry the banners of Russian nationalism and Bolshevik class warfare southward into Iran, Afghanistan, and India, and southwestward into Rumania, and possibly other Balkan states. Apparently the unexpected difficulties encountered in Finland delayed these plans.

Setbacks to the Movement. The reverse side of the picture was not nearly so favorable to the success of world communism. Stalin's entente with Hitler, his invasion of Poland, his extortion of strategic bases, and mutual assistance pacts from the small Baltic states under threat of

invasion, and particularly his effort to subjugate Finland aroused world-wide revulsion and indignation. Thousands of Communists and fellow-travelers deserted the orthodox Communist (Stalinist) parties throughout the world, although the party apparatus in virtually all countries remained intact. From his place of exile in Mexico, Leon Trotsky declared the Hitler-Stalin rapprochement had broken the back of the Third International and insured the early demise of the Communist party in the United States.

Effect in the United States. While most leaders of the American Communist party and its press defended the Hitler-Stalin pact, there were numerous defections. According to Benjamin Stolberg, the party membership dropped from 60,000 to about 35,000 within three months after the non-aggression pact was concluded. Some of the dissenters shifted their allegiance to the Trotskyite and other anti-Stalin Communist factions, while others went over to the Socialist or other more conservative political movements.

There were also numerous schisms and defections within the so-called "Communist front" organizations, some 500 of which were said to have been formed, usually under hidden Communist inspiration, among liberal and left-wing elements. Among the more important organizations affected by dissensions of this nature were the American Student Union, American League for Peace and Democracy, American Committee for Protection of the Foreign Born, International Labor Defense, International Juridical Association, and American Youth Congress. On August 14, shortly before the German-Soviet pact, 400 leading American intellectuals published an open letter advocating closer co-operation between Soviet Russia and the United States to combat growing reactionary and Fascist movements. After the pact became known, most of those signing the letter repudiated their former views and bitterly denounced the Stalin regime for the "betrayal" of the liberal, democratic principles for which they stood.

Besides creating dissension within the ranks of the Communists and their supporters, Stalin's policy made Communists more than ever suspect to anti-Communist elements. The Congressional investigation of Communist and other "anti-American activities" gained wider popular support. Outbreaks of mob violence against Communist gatherings were reported in San Antonio, Detroit, and Aberdeen, Wash. Earl Browder, general secretary of the Communist party, was indicted on October 24 in New York City by a Federal grand jury on a charge of using a passport obtained by making a false statement. Indictments of William Wiener, national treasurer, and Nicholas Dozenberg, a founder of the American Communist party, followed on similar charges.

While awaiting trial Browder in a series of bitter speeches assailed President Roosevelt, the New Deal, the Pope, and many critics and Communist dissenters. He declared that "reactionary hysteria" was gripping the American bourgeoisie in the face of the "imperialist war" because they knew the war was "placing the Socialist revolution on the order of the day there (in Europe) as a practical question." "America itself," he declared in Boston on November 5, "is technically, objectively, the country which is the most ripe, the most prepared, for a quick transition to socialism, for which it lacks only the under-

standing and the will of the masses to that goal."

The Stalin-Hitler pact and the subsequent Soviet aggressions also provoked a strong counter-attack against Communist influence in American labor unions. The American Labor party of New York City on September 4 condemned the Communists of the United States as "betrayers of the labor movement, antagonists of democracy and protagonists of dictatorship." In subsequent months the leaders of the party conducted a vigorous drive to force out numerous Communists and Communist-dominated district clubs. In October John L. Lewis launched an anti-Communist drive within the Congress of Industrial Organizations, threatening to remove any officer or member found following Communist policy.

The influence of Communists in the schools was more carefully scrutinized. In a report published on December 15, Professor George S. Counts of Teachers College, national president of the American Federation of Teachers, said that while Communists constituted "but the smallest fraction of the total membership" of his federation, they had been able to achieve a "precarious, temporary control" over some locals. Bills to curb revolutionary activities found increasing public favor. The Devany bill passed in New York State on May 28 barred persons advocating forceful overthrow of the government from civil service and teaching positions in the public schools.

See also BRIDGES CASE, COMMUNIST PARTY, DIES COMMITTEE.

Other Countries. While Stalin's expansionist policies were said to appeal to the younger and more nationalistic elements in the Soviet Union, the repudiation of all the previous Bolshevik strictures against fascism and aggression was reported by Moscow correspondents to have caused considerable questioning and discontent within the Soviet Union itself. In the other European countries, with the exception of Germany and Bulgaria, the Stalin-Hitler accord shattered Communist influence and prestige seemingly beyond repair.

In France, where the Communist party had played a powerful role for more than a decade and polled over a million votes in the 1936 elections, the movement was weakened by the defection of many members and then outlawed by the government on September 26 for sponsoring defeatist propaganda. The French Parliament, municipal councils, and other governmental bodies were purged of Communists and many of the party leaders were arrested on charges of conspiring with or aiding the enemy.

The British Communist party was unmolested by the government, but was shaken by internal dissensions and numerous withdrawals. At the outset of the war it issued a manifesto calling on the people "to secure a military victory over the Fascist system." But in October it published an official "correction" of this manifesto, asserting that it "failed to take into account the basic changes in the international situation arising from the rejection of the peace front by Britain and France."

"By rejection of a firm peace front with the Soviet Union," the correction stated, "the British, French and Polish Governments have equal responsibility with German fascism for the present war." The new "party line" of opposition to the war led to the dismissal of Harry Pollitt as the party's general secretary. The anti-war propa-

ganda was continued during the remainder of the year, although opposed by many former Communists and their sympathizers. The Lord Provost of Glasgow declared in December that 1000 Communist agents were working to stir up trouble in certain industries of that city.

In Denmark, Norway, and Sweden the Soviet attack upon Finland brought hostility against the Communists to a high pitch. In the Danish and Swedish parliaments attempts of Communist members to speak led members of all other parties to walk out. Action to outlaw the Communist party in Sweden was in prospect at the year end. This situation was in contrast with the attitude displayed by the British, French, and Norwegian delegations to the eighth Congress of the International Federation of Trade Unions at Zurich, Switzerland, early in July. At that time these delegations supported a resolution inviting the Soviet trade unions to affiliate with the I.F.T.U. The resolution was defeated by 46 votes to 37.

In Mexico and Chile, the two Latin American countries where orthodox Communist parties had gained a firm foothold, the Soviet-German pact had equally disastrous repercussions upon Stalin's followers. In both countries, the movement was discredited and shorn of much of its former influence. In these countries, too, anti-Communist elements and movements gained further support. The Vatican, aroused by the sovietization of Catholic Poland, took an even more active lead in the world struggle against communism.

In Spain the effort of the Third International to gain control of the revolutionary and liberal groups supporting the Loyalist Government was ended for the time being by General Franco's victory. Communists who failed to escape abroad were ruthlessly extirpated.

See CHILE, CHINA, FINLAND, FRANCE, GERMANY, MEXICO, SPAIN, UNION OF SOVIET SOCIALIST REPUBLICS, and other countries, under *History*; *DEMOCRACY*; *FASCISM*.

COMMUNIST PARTY. Unlike the political parties of the type usual in the United States, the Communist Party has an enrolled membership of whom dues are required. The membership was stated at the beginning of 1939 as 80,327. The vote for the National ticket of the Communist party in the election of 1936 was 80,159. The party was chartered in a number of States; Representative Dies (see *DIES COMMITTEE*), in an address (August 1) urged that its State charters be revoked. The party also constituted a section of the Communist International, a world-wide body having its headquarters in Russia.

For particulars of the investigation of Communist activity by the *DIES COMMITTEE*, see under that title. The number of members of the party in the United States was estimated by Earl Browder, in connection with that investigation, as about 100,000. Members' payments of dues, as earlier reported by Browder for 1937, totaled \$73,352. William E. Browder, brother of the foregoing and executive secretary of the party, stated in the course of the Dies investigation that the dues paid by members of the New York State organization of the party, about 27,000 in number, averaged \$20 to the member. The titular head of the party, the party chairman, in 1939 was William Z. Foster.

In New York City the party ousted from membership (December 14) two officials of a strong trade union, and five other of this union's officials reportedly resigned from the party. This labor

organization, Local 22 of the Ladies' Garment Workers' Union, had a reported membership of some 30,000, including 500 members of the party. The difficulty between the organization and the party, represented by the former as involving the union's policies, had apparent connection also with anti-Communist sentiment inspired among Jewish garment-workers by the party's attitude of approval toward the entente between Germany and the Russian Communist government. On December 15 the party further altered its course to follow Russia's by advising its members in New York City to give up a previously established boycott of German goods. See *COMMUNISM*.

COMMUNITY CHESTS AND COUNCILS, INC. An association organized in February, 1918, when only 21 cities were using the centralized method of raising philanthropic and charitable funds. It was first known as the American Association for Community Organization, a name which it continued to bear until 1927, when the name was changed to the Association of Community Chests and Councils. In 1933 the association was incorporated, and adopted its present name. The Association staff is guided by an Advisory Committee of local chest and council executives in carrying out the policies decided upon by the Board of Directors. The association is financed by dues from its corporate members.

The purpose of Community Chests and Councils is to aid and assist local community chests in their efforts to raise, manage, and distribute money for social welfare purposes; to encourage and stimulate collective community planning for social welfare, and the development of better standards for community organization, as well as to harmonize and make more efficient the work of all social welfare organizations; to co-operate with nation-wide and other organizations in joint efforts to promote social welfare; to carry on other projects in connection with the achievement of all these purposes.

The Mobilization for Human Needs is a programme of national information regarding the social needs of the times, urging citizens to support their local private welfare appeals. It is sponsored by a National Citizens' Committee of public-spirited men and women.

Thirty-six national organizations for social welfare and health co-operate in this effort, with Community Chests and Councils, Inc., acting as administrative agency. The Mobilization for Human Needs arranges public meetings of national significance, secures the donation of nation-wide radio time, and stimulates the publication of articles and editorials in magazines and newspapers. It does not raise a national fund, but throws its strength to local campaigns of chests and welfare funds.

Of the 522 chests in operation, 506 are in the United States proper, 2 in the territory of Hawaii, 1 in the Virgin Islands, and 13 in Canada and other foreign countries. All but six cities of 100,000 population and over in the United States have community chests. Nine million contributors in 518 cities gave \$82,808,793 to community chests to be used for private social work in their communities during 1939.

The officers in 1939-40 were: Honorary and acting president, George E. Vincent, Greenwich, Conn.; vice presidents, John Stewart Bryan, Richmond, Va., and Geoffrey Smith, Philadelphia, Pa.; treasurer, J. Herbert Case, Plainfield, N. J.; secretary, Pierce Atwater, St. Paul, Minn.;

executive vice president, Allen T. Burns. Headquarters, 155 East 44th St., New York City.

CONCILIATION SERVICE, U.S. See UNITED STATES CONCILIATION SERVICE.

CONGO, BELGIAN. A colony of Belgium, in central Africa. Area, 902,082 square miles; population (Jan. 1, 1938), 10,217,408 natives and 23,091 whites. The language spoken by the natives is Kiswahili; the commercial language of the Upper Congo is Bangala; near the coast, Fiote is spoken; in the southern part of the country the language is Tshiluba. Chief towns: Léopoldville (capital), Matadi, Elisabethville, Jadotville, Stanleyville, Coquilhatville.

Production and Trade. Important agricultural products in 1937 (in metric tons) palm oil (69,133), palm-kernel oil (43,000), ginned cotton (38,000; 35,000 in 1938), cottonseed (83,600; 77,000 in 1938), coffee (19,600; 26,000 in 1938), copal gum (16,848), sugar (15,000), maize (11,334), rubber, cocoa, groundnuts, timber, and bananas. The country is rich in minerals, the chief being copper (124,000 metric tons in 1938), diamonds (5,059,927 carats in 1937), gold (20,993 kilograms in 1938), silver (76.6 metric tons in 1938), tin (8900 metric tons in 1938), manganese (3800 metric tons in 1938), cobalt, radium, uranium, and iron. In 1937 the output of ivory was 183 metric tons. Cattle raising is successfully carried on only in the districts in which there are no tsetse flies. In 1938, imports were valued at 1,022,000,000 francs; exports, 1,897,000,000 francs (Belgian franc averaged \$0.03378 for 1938).

Communications. The navigable portions of the river Congo and its tributaries are an important means of communication and transport to the interior. Air services link most of the important towns in the colony and there is a weekly service in operation with Brussels in Belgium and Léopoldville and Elisabethville. In 1938 there were 3051 miles of railway, 42,336 miles of roads, 4209 miles of telegraph lines, 4000 miles of telephone lines, and 28 wireless stations.

Government. For 1938, estimated revenue 748,216,000 francs; estimated expenditure, 798,216,000. Public debt (Jan. 1, 1938), 5,917,350,575 francs. The Belgian Congo is divided into 6 provinces and 16 administrative districts. Each province has a capital bearing the same name as the province. Government is under the control of the Belgian minister for the colonies at Brussels, who is aided by a colonial council (of which he is president) consisting of 14 members (8 appointed by the King, 3 chosen by the senate, and 3 by the chamber of representatives). A governor-general (aided by a vice-governor-general, state inspectors, and 6 provincial commissioners) represents the King in the colony. Governor-General, Pierre Ryckmans (appointed December, 1934).

Ruanda (rōo-ān'dā)-**Urundi** (ōō-rōon'dē). The two districts adjoining eastern Belgian Congo, formerly a part of German East Africa, mandated to Belgium by the League of Nations (July, 1919). Area, 21,230 square miles; population (Jan. 1, 1938), 3,720,000 of whom 1076 were Europeans. Capital, Usumbura. Livestock raising is the main occupation of the people. The chief products are maize, potatoes, groundnuts, and gold. In 1937, imports were valued at 72,630,719 francs; exports,

69,678,548 francs. For 1938, estimated revenue (ordinary and extraordinary) was 45,597,525 francs; estimated expenditure (ordinary), 37,386,946 francs. Public debt (Jan. 1, 1938), 150,000,000 francs. Both districts were united, for administrative purposes, with the Belgian Congo and placed under the supervision of a vice-governor (law of Aug. 21, 1925).

CONGO, FRENCH. See FRENCH EQUATORIAL AFRICA.

CONGREGATIONAL AND CHRISTIAN CHURCHES, THE GENERAL COUNCIL OF THE. A general council was instituted at Seattle, Wash., June 27, 1931, when the National Council of the Congregational Churches in the United States and the General Convention of the Christian Church merged their activities in this new organization. The International Council which was to have been held at Wellesley, Mass., during July, 1940, has been indefinitely postponed because of war conditions. The next biennial meeting will be held at Berkeley, Calif., Aug. 15-22, 1940. For the officers elected at the last biennium, see the YEAR BOOK for 1938.

The headquarters of the General Council of the Congregational and Christian Churches are at 287 Fourth Avenue, New York City. Those of the Board of Home Missions at the same address, with offices also at 14 Beacon St., Boston, Mass., and those of the American Board at 14 Beacon St., Boston, Mass. For statistics, see RELIGIOUS ORGANIZATIONS.

CONGRESS (U.S., MEMBERS AND OFFICERS). The members of the 76th Congress, at its assembly on Jan. 3, 1939, are shown in the following lists; political affiliation is shown in each case after the name, by a D (Democrat), R (Republican), P (Progressive), FL (Farmer Labor), AL (American Labor), or I (Independent).

WYOMING

Representative at Large: Frank O. Horton, R

In the Senate the leadership of the Democratic majority's stalwart group continued with Barkley of Kentucky. Vandenberg of Michigan remained leader of the Republican minority; Glass of Virginia continued as chairman of the Senate's committee on appropriations; Pittman of Nevada, to head that on foreign relations; and Harrison of Mississippi, that on finance. In the House of Representatives, William B. Bankhead, Representative from Alabama, was again chosen for Speaker, McReynolds of Tennessee held the chairmanship of the House's committee on foreign affairs, and Doughton of North Carolina, that of the committee on ways and means. In place of Snell of New York, no longer a member, the Republicans chose Joseph W. Martin, Jr., of Massachusetts, for minority leader. Rayburn of Texas remained majority leader of the House.

For legislation, see UNITED STATES under *Legislation*.

CONGRESS OF INDUSTRIAL ORGANIZATIONS. The Congress of Industrial Organizations continued to grow numerically and in influence during the year 1939. Founded in November, 1935 by the presidents of eight unions, with less than one million members, the C.I.O. was able to report to its second constitutional convention in San Francisco, Oct. 10, 1939, a four-fold growth in membership. With 45 national and international unions and organizing committees affiliated, 210 state, county, and city Industrial Union Councils and 567 directly affiliated Local Industrial Unions, a total membership of approximately four million was represented. See AMERICAN FEDERATION OF LABOR; COMMUNISM; LABOR CONDITIONS; LABOR LEGISLATION; RELIEF.

The two most important meetings of the Congress of Industrial Organizations during 1939 were the Executive Board meeting held in Washington, D. C., June 13-15, and the second constitutional convention held in San Francisco, Calif., October 10-13.

The Executive Board meeting heard reports on the activities of the executive officers and of the C.I.O. committees on legislation, unemployment,

social security, and housing. It adopted a program for expanding organizing activities and for legislation to cope with unemployment and insecurity, and decided to launch a national campaign for pensions of \$60 a month at 60 years of age, and \$90 for married couples.

Progress. The progress of the Congress of Industrial Organizations during the year was summarized in the report of the President to the convention in San Francisco. This report noted many organizational and legislative advances during the year. "The CIO has held its own and maintained its ranks through a long period of bitter unemployment and in face of the most vicious and concentrated attacks of its enemies," it stated. "More than this, it has not only held its own, but it has also made many organizational advances in industries where it was already established and has pushed forward into new fields."

"The economic strength of the CIO has been reflected in increased political influence, which the CIO has used in recent elections and in the last session of Congress to strike many a blow in the cause of liberalism and progress. The CIO has used its political influence to defend existing labor and social legislation; to demand the enactment of new legislation in the interests of labor, the unemployed, the farmers, and the great masses of the people; and to protect and expand our democratic liberties."

The President's report to the San Francisco convention noted the victory of the United Mine Workers of America in winning the union shop for 600,000 coal miners, and making that organization more powerful than ever before in its history, as one of the major achievements of the C.I.O. during the year.

It also referred to the fact that the Amalgamated Clothing Workers of America had reached the peak of its strength during the year, "with renewed agreements bringing many improvements, with increased membership, and with a record of constructive contributions to the welfare of this industry and the workers employed in it."

The success of the C.I.O.-United Automobile Workers of America in defeating a dual movement sponsored by the American Federation of Labor was another achievement noted. The C.I.O. unions during the year won a series of elections by overwhelming majorities. These included an election at the Chrysler Corporation plants in which it received 40,564 votes, as against 4673 for the A. F. of L.; an election at the Briggs Manufacturing Company, in which the C.I.O. union received 13,301 votes, while the A. F. of L. union got only 1052; and similar large election majorities for the C.I.O. at the Packard, Motor Products, Kelsey-Hayes, and other plants.

The Steel Workers Organizing Committee also made great progress during the year, and was able to report to the San Francisco convention 614 corporation-wide and company collective bargaining agreements covering the conditions of some 625,000 workers employed in the industry. The number of its local lodges rose to 1200 during the year; and it was estimated that since its formation, the SWOC had won annual wage increases amounting to about 287 million dollars for the steel workers of the country.

The Textile Workers Organizing Committee of the C.I.O. merged with the United Textile Workers at a joint convention in May, 1939, forming a new international union, the Textile Workers Union of America. This organization also won

many elections and new agreements during the year, reporting to the C.I.O. convention a total of more than 1100 signed collective bargaining agreements, covering over three hundred thousand workers.

Among the newer C.I.O. unions, the Packinghouse Workers Organizing Committee made notable progress during 1939 in organizing the unorganized. Having won scores of agreements from independent packers, it won a series of election victories during the year at the plants of some of the biggest companies, and was certified as the workers' collective bargaining agent in all the major plants of Armour & Company.

Two consolidations of C.I.O. unions took place during 1939. The National Leather Workers Association merged with the Fur Workers International Union to form the Fur and Leather Workers International Union, which has since launched a drive to organize the unorganized workers throughout the industry. Several units of the United Fishermen's Union of the Pacific merged to become the International Union of Fishermen and Allied Workers of America.

The C.I.O. entered a new field during the year by setting up the United Construction Workers Organizing Committee on Aug. 1, 1939, for the purpose of organizing all workers in and around the construction industry without regard to creed, race, or nationality. The new committee consists of A. D. Lewis, chairman, Philip Murray, James B. Carey, S. H. Dalrymple, and R. J. Thomas. The number of local charters issued by the new organization had increased to 80 by the end of the year and a number of contracts had been won with building contractors.

Besides the unions mentioned, all other C.I.O. organizations reported considerable organizing progress during the year, as indicated by increases in membership, Labor Board election victories, and many new collective bargaining agreements.

The President's report also stated that in the past year the C.I.O. had won more Labor Board elections than any other group and had received more workers' votes than all other unions combined.

In regard to legislative achievements, it stated that in the past session of Congress "the CIO led the fight for progressive legislation and was the backbone of the liberal resistance to attacks on existing social legislation." It noted that "CIO efforts were effective in preventing emasculating amendments to the National Labor Relations Act and the Wage-Hour Law, and preventing even worse slashes than were made in the WPA program."

Purposes. The objects of the Congress of Industrial Organizations were outlined in the constitution first adopted at the Pittsburgh convention in November, 1938, and were reaffirmed at the 1939 convention as follows:

First: To bring about the effective organization of the working men and women of America regardless of race, creed, color, or nationality, and to unite them for common action into labor unions for their mutual aid and protection.

Second: To extend the benefits of collective bargaining and to secure for the workers means to establish peaceful relations with their employers, by forming labor unions capable of dealing with modern aggregates of industry and finance.

Third: To maintain determined adherence to obligations and responsibilities under collective bargaining and wage agreements.

Fourth: To secure legislation safeguarding the economic security and social welfare of the workers of America, to protect and extend our democratic institutions and

civil rights and liberties, and thus to perpetuate the cherished traditions of our democracy.

The San Francisco convention declared that continued organization of the unorganized workers was "the primary purpose of the CIO," unanimously adopting the following resolution:

Whereas, (1) The self-organization of American workers into modern labor unions, capable of dealing with the vast combines of industry and capital, is the fundamental and unalterable purpose of the CIO, the cornerstone of its economic, legislative and cultural activities, and the very reason for its being; and

(2) During the last two years of adverse economic conditions the CIO has forged steadily ahead with its all-important organizing work and has met with a success which augurs well for the results to be achieved during the period of more promising economic circumstances which lies directly ahead; now, therefore be it

Resolved, That the primary purpose of the CIO during the months and years immediately before us, as in the past, must be the advancement of the basic task for which the CIO was created and to which it is dedicated, the organizing of the unorganized millions of American workers on an industrial basis.

Among other important actions taken at the San Francisco convention was a resolution on labor and the European war, in which it was resolved:

(1) That labor wants no war nor any part of it and while countries in Europe are engaged in their barbaric orgies of conquest and aggression as they have been doing for centuries, it must ever be the purpose of the United States to remain out of these wars, and

(2) That the CIO offers its support to President Roosevelt's neutrality policy based upon the cardinal principle of keeping America out of war and calls for further legislation to take the profits out of war business by rigorous taxation of excess profits and surplus incomes; and

(3) That this Second Annual Convention of the CIO declares in no equivocal terms that we will defend the free institutions of this Republic, the greatest democracy on earth, under the Declaration of Independence and the Constitution, a government of the people, for the people and by the people. It shall ever be our purpose as Americans to defend our country and our free institutions against foreign invasion; and

(4) The CIO will devote itself to continuing the organization of the unorganized American workers, promoting genuine collective bargaining, for the welfare of American labor and the stabilization of industry, and, through the preservation of peace, find a solution of the basic economic ills of this country and bring about a permanent prosperity. By these efforts we shall prove to the world that the United States is the highest form of democratic government on earth and set the example of the effectiveness of democratic government in promoting life, liberty and happiness for mankind.

Legislative Issues. The San Francisco convention took action on all major legislative issues affecting the labor movement, and its policies were embodied in a legislative program for 1940, which was adopted at a meeting in Washington, Dec. 15, 1939, of the C.I.O. legislative committee, consisting of John L. Lewis, chairman, Philip Murray, Sidney Hillman, R. J. Thomas, S. H. Dalrymple, Reid Robinson, Emil Rieve, James Carey, and Lee Pressman, secretary.

The legislative purposes of the C.I.O. are summed up in the following paragraphs from the program:

The people of this country, whenever the occasion has presented itself, have strongly and pointedly demonstrated their desire to continue and extend the gains and benefits of the social legislation enacted during the past few years. There can be no retreat now, rather there must be a steady forward march to extend the social and economic program of the nation.

At the present time, the nations in Europe and Asia are convulsed by international warfare. Democratic institutions and civil liberties in those nations have been abolished. Labor in those countries has been compelled to carry the brunt of the wartime burdens; unions there are facing virtual extinction. Unfortunately, the time and energy of our own Government representatives during the past few months have been devoted almost exclusively to international affairs at the expense of the interests and needs of the American people at home.

Today the American problem No. 1 is still the problem of the 9 to 10 million employable men and women who are without jobs in private industry. In spite of a most extensive acceleration of business activity during the past few months, the huge number of unemployed remains undiminished. These millions of unemployed men and women are ready subjects to the wiles of the demagogues who actually desire to undermine and destroy our democratic institutions.

The CIO urges for the serious consideration by the Federal Congress a legislative program based upon certain fundamental objectives:

- (1) the United States must keep out of any involvement in the foreign wars;
- (2) the attention of this country and the energies of our Government, industrial and labor leaders of this country, must be directed toward the immediate solving of the problem of unemployment;
- (3) the democratic rights and institutions of this country must be preserved and maintained;
- (4) there must be continued assurance and protection of the rights of labor to organize and bargain collectively as the cornerstone for the preservation and extension of any economic and social program.

The legislative program of the C.I.O. recommended that the President of the United States convene a conference of representatives of Government, industry, labor, and agriculture to work out concrete plans to solve unemployment; and that pending such conference and solution Congress should appropriate sufficient funds for public works to provide jobs for at least three million men and women.

In regard to the nation's youth problem, the C.I.O. program called for a program of public works appropriations, contributing to the needs of youth and to the public welfare, sufficient to employ all young people who are out of work and out of school.

The C.I.O. legislative committee took note of two serious difficulties that have risen in connection with the National Labor Relations Act, as follows:

In the first place, the enforcement provisions of the Labor Act are not sufficiently severe to actually obtain enforcement from those corporations which are still determined to violate the rights of labor.

In the second place, the National Labor Relations Board, in an attempt to appease the reactionary interests, including the leaders of the American Federation of Labor, has issued decisions which have threatened the existence of the industrial unions of the CIO by carving out crafts in industrial plants organized by the CIO.

The C.I.O. program therefore called for three amendments to the National Labor Relations Act:

1. A provision which will provide for criminal penalties to be imposed upon any employer found to have violated any of the provisions of the National Labor Relations Act. This will bring the National Labor Relations Act into line with the provisions of the Fair Labor Standards Act and the Railway Labor Act, violation of which permits the imposition of criminal penalties.
2. A provision which will prevent the Government from awarding any Government contracts to any employer found to have violated the National Labor Relations Act. At the present time the most reactionary and vicious anti-labor corporations such as Bethlehem Steel, Douglas Aircraft, and Standard Oil Company of New Jersey, are the most frequent beneficiaries of Government contracts while they are actually violating the labor law of the land.
3. A provision which will prevent the National Labor Relations Board from carving up any industrial units established by the industrial unions of the C.I.O.

Passage of the LaFollette-Thomas Oppressive Labor Practices Act was asked, to outlaw the use of industrial spies and the purchase of munitions by private corporations.

In regard to the Fair Labor Standards Act, the C.I.O. called upon Congress not to pass any amendments which would exclude groups of exploited workers from its benefits. On the contrary, it urged larger appropriations for administrative expenses to assure real enforcement, and stated that, after the Act has had a chance to

operate, Congress should extend the benefits of the legislation to the millions of workers who are still deprived of its protection.

In regard to social security, the C.I.O. legislative program asked that the provisions for old age and unemployment compensation be expanded, simplified, and liberalized through Federal action. It again advanced the C.I.O. pension program for pensions of \$60 a month at the age of 60 and an additional allowance of \$30 to aged wives.

The C.I.O. also called for an expanded public health and industrial hygiene program, and for expansion of Government housing activities. It urged that at least one million new housing units be built each year, of which the Government, in order to stimulate private builders, must provide at least 300,000.

In regard to taxation, the C.I.O. program pointed out that labor and consumer groups have been bearing the brunt of increased expenses, social welfare, and national defense. It urged that the present tax burden upon consumer groups and wage earners be substantially reduced; and that a far greater proportion of total tax revenue be derived by tapping the large concentrations of wealth and surplus profits.

Origin. The C.I.O. was first established in November, 1935, under the name of the Committee for Industrial Organization, by the presidents of eight international unions of the American Federation of Labor. Its purpose was declared to be "to encourage and promote organization of the workers in the mass production and unorganized industries of the nation and affiliation with the American Federation of Labor."

In August, 1936, however, the executive council of the A. F. of L., meeting in Washington, ordered the C.I.O. unions to disband their committee and discontinue their organizing activities, under penalty of suspension from the Federation. This suspension went into effect in September, 1936, and thereafter the committee continued its organizing activities independently of the A. F. of L.

In November, 1938, the Committee for Industrial Organization held a convention in Pittsburgh, Pa., to establish the new movement on a permanent basis. It adopted a constitution and changed its name to the Congress of Industrial Organizations.

Officers. Officers of the Congress of Industrial Organizations elected at its 1939 convention are as follows: President, John L. Lewis, president of the United Mine Workers of America. Vice Presidents: Philip Murray, chairman of the Steel Workers Organizing Committee; Sidney Hillman, president of the Amalgamated Clothing Workers of America; R. J. Thomas, president of the United Automobile Workers of America; S. H. Dalrymple, president of the United Rubber Workers of America; Reid Robinson, president of the International Union of Mine, Mill & Smelter Workers; Emil Rieve, president of the Textile Workers Union of America. Secretary, James B. Carey, president of the United Electrical, Radio & Machine Workers of America. Headquarters of the Congress of Industrial Organizations are located at 1106 Connecticut Avenue, N. W., Washington, D. C.

JOHN L. LEWIS.

CONNECTICUT. Area and Population. Area, 4965 square miles; included (1930) water, 145 square miles. Population: Apr. 1, 1930 (census), 1,606,903; July 1, 1937 (Federal estimate),

1,741,000; 1920 (census), 1,380,631. Hartford, the capital, had (1930) 164,072 inhabitants; New Haven, 162,655.

Agriculture. Connecticut harvested, in 1939, 444,700 acres of principal crops. Three-fourths of this, or 343,000 acres, bore 412,000 tons of tame hay (estimated farm value, \$6,716,000); tobacco, using little land but important in its high monetary return, gave from 17,200 acres 25,590,000 pounds (\$10,442,000); potatoes, on 17,500 acres, 3,238,000 bushels (\$3,238,000); corn, 50,000 acres, 1,950,000 bushels (\$1,384,000); apples yielded 1,030,000 bushels gathered for market (\$978,000).

Manufacturing. Establishments in Connecticut, engaged in manufacturing, numbered 2892 in 1937 (in 1935, 2820); employed 262,620 wage-earners (in 1935, 223,041); and paid, in wages, \$312,269,732 (in 1935, \$226,253,427). They produced goods to the total of \$1,261,788,693 (in 1935, \$899,401,096). The greater part of the total yearly value of the output was contributed by the processes in these manufacturing, as distinct from cost of materials. In 1937, \$680,787,099 (in 1925, \$491,483,051) was the sum of value added to materials by manufacture. A characteristic of industry in the State, the prevalence of a sort of production greatly dependent on the efforts of the worker rather than on automatic processes, appeared in the high ratio, 45 per cent, of the total wages paid to the value added by manufacture. The making of brass and other non-ferrous metal alloys, while not typical in all these respects, was an outstanding industry, using 22,210 wage-earners and producing goods to the value of \$155,725,947 in 1937; the production of electrical machinery, apparatus, and supplies engaged 16,741 wage-earners and attained \$96,512,785 of output. Among the lines of production most characteristic of the State were: machine-shop products, to the total of \$65,095,295; hardware (outside of separately listed sorts), \$48,305,548; machine tools, \$29,115,574; fur-felt hats, \$28,458,885; typewriters and parts, \$22,794,956; silverware and plated ware, \$20,026,822; clocks, watches, and parts, \$21,289,104; and cutlery, \$18,383,096.

Bridgeport had 34,747 wage-earners in factories and produced \$178,066,597; Hartford, 26,572, \$109,147,153; Waterbury, 23,752, \$120,389,265; New Haven, 22,260, \$106,502,599. Each of 13 among the cities manufactured goods in excess of \$20,000,000.

Education. Connecticut's inhabitants of school age were accounted, for the year ended June 30, 1939, as 320,555, from 4 to 16 years of age. The year's enrollments of pupils in public schools totaled 296,888; this comprised 15,589 in kindergartens, 178,809 in elementary schools, 24,821 in junior high schools, and 77,669 in high schools. The year's expenditures for public-school education totaled \$31,394,411.

Legislation. The regular biennial session of the General Assembly, which convened in January, ended only on June 8, having spent weeks in partisan dispute over rival proposals for a law to forbid the appointment of legislators to remunerated posts in the State government during the terms for which they had been elected. The State's ratification of the Bill of Rights (ten original amendments of the Federal Constitution) was voted, 148 years after adoption by the Union; this action, while not the result of any obvious necessity, was promoted by the Democratic group in both houses and allowed to pass. Governor Baldwin's desire to do away with the State's inspection

of automobiles was followed only in part: the two chambers failed to agree on a measure to abolish the inspectors, but the exclusion of an appropriation for their work left it possible for the inspection to be suspended. The Legislature authorized the construction of the Wilbur Cross Parkway, a road similar in character to the Merritt Parkway and extending up the valley of the Connecticut River to Hartford; the same enactment authorized the State's Highway Department to levy toll on the completed part of the Merritt Parkway; proceeds were to build up a fund for extending the Parkway over the Housatonic River and beyond, to a junction with the proposed Wilbur Cross Parkway.

Dealing with demand for the reform of the municipal government of Waterbury, an enactment authorized that city to hold an election on a referendum proposing the direction of affairs by a city manager.

Political and Other Events. Gov. Raymond E. Baldwin took office January 4. He had served in the Navy, gaining the rank of Lieutenant in 1918; had graduated at the Yale Law School; had practised law at Bridgeport for 15 years; and had been Republican floor leader in the lower house of the General Assembly.

Waterbury Trials. The year's most conspicuous political event was the trial and conviction, August 16, for conspiracy to defraud Waterbury, of Mayor Frank Hayes (Democrat); he had served as Lieutenant-Governor for two terms of the administration of Governor Cross. Indictments had been brought in 1938; 26 others had been indicted with Hayes; they were largely officers, actual or former, of the city, employees in its service, and men who had worked with them in corrupt transactions; two Republican politicians were among the number. Besides Hayes, 19 were convicted; 3 pleaded guilty; and 3 were freed by court order. The trial judge, Ernest A. Inglis of the Superior Court, sentenced Hayes to prison for not under 10 nor over 15 years; Daniel J. Leary, former City Comptroller, received a like sentence; lighter penalties were imposed on 20 others.

The convicted men were alleged to have bled Waterbury of \$1,000,000 or more in the course of numerous transactions between 1930 and 1938. The State's case against them was established by the evidence of the city's accounts and the testimony of persons, of whom many had been privy to some of the asserted deals. Hayes became Mayor in 1930, promising to give a businesslike administration and cut the local tax rate. He had obtained from the Legislature an increase of his mayoral authority; an issue of \$2,000,000 in municipal bonds for the cost of local aid to the activity of the WPA was said to have been used as a source of unduly profitable payments to some contractors. Two Waterbury newspapers, the *Republican* and the *American*, campaigned against the Hayes regime, and in the election of 1937 its former majority of about 7000 dropped to a scant lead, Comptroller Leary, indeed, being defeated by a margin of 33 votes. The new Comptroller, Sherwood L. Rowland, on entering office found in the city's accounts matters warranting the grand jury's investigation and indictments, which followed.

After the trial of Hayes and his associates a motion in the city's Board of Aldermen, to remove from their posts Mayor Hayes and his executive secretary, T. P. Kelly, was defeated by the Democratic minority, whose opposition kept the vote

short of the required two-thirds for removal (August 24); the defendants' motion for appeal was pending at the time; both resigned some days later. At a special election held October 3, the popular vote of Waterbury decisively defeated a referendum, held under authorization from the General Assembly, on a proposal to drop the charter's provision for a mayor of extensive authority and adopt instead a city manager. The vacancy left by the resignation of Hayes was filled by popular election, November 14; another Democrat, Vincent A. Scully, was elected mayor by a plurality of about 2384.

Other Events. The prosecution of two physicians and a nurse on the charge of giving advice about contraceptives at a maternal health clinic, the Chase Dispensary of the Waterbury Hospital, in violation of the State's law on birth control was dismissed (August 7) by a decision of the Superior Court; the court held this law defective in failing to allow proper exceptions to restrictions put on physicians, whom it found entitled to prescribe according to the requirements of patients' health.

The Merritt Parkway imposed a toll of 10 cents on each automobile passing a station fixed near the connection with the Westchester (N. Y.) County parkway system; toll taken on the first day (June 21) amounted to somewhat less than \$1000.

Bridgeport elected Jasper McLevy, Socialist, to his fourth consecutive term as mayor (November 7); he received a plurality of about 12,467 votes, more than the whole vote for his nearest opponent, but only two-thirds of his own plurality of 1937. The first non-Socialist since 1933 was elected to the common council.

Officers. The chief officers of Connecticut, serving in 1939, were: Governor, Raymond E. Baldwin (Rep.); Lieutenant-Governor, James L. McConaughy; Secretary of State, Sara B. Crawford; Treasurer, Joseph E. Talbot; Comptroller, Fred R. Zeller; Attorney-General, Francis A. Pallotti; Commissioner of Education, Alonzo G. Grace.

CONNECTICUT COLLEGE. A liberal college of arts and sciences for the higher education of women in New London, Conn., chartered in 1911 by the State of Connecticut and opened for instruction in 1915. The enrollment for the autumn of 1939 is 748. The faculty numbers 80 full-time members. The productive funds amount to \$1,361,261, and the budget for the year is \$749,300. There are 83,341 accessioned volumes in the library. In 1938-39 the college received total gifts amounting to \$472,632, for buildings, scholarships, etc. Buildings under construction during the year were: The Frank Loomis Palmer Auditorium, a bequest from the will of the late Virginia Palmer of New London; the Harkness Chapel, a gift of Mrs. Mary Stillman Harkness of New York; Frederic Bill Hall, a new academic building containing laboratories for psychology and physics, studios for fine arts, and a modern lecture room for general use, built with the bequest of Mrs. Frederic Bill of Groton; Emily Abbey House, a co-operative dormitory especially planned for the living and working of 26 self-supporting young women, the gift of Mrs. Emily Abbey Gill of Springfield, Mass.; Faculty Apartment House, an anonymous gift providing homes for four members of the faculty; reconstruction of the power house. Beginning with the Class of 1939, a final general ex-

amination in the major subject is required for graduation. The development of individual work is also an important part of the program. Through the recent gift of Mrs. Beatrice Fox Auerbach of Hartford, a major for students interested in business, especially retailing, was added in the fall of 1939. President, Katharine Blunt, Ph.D., LL.D.

CO-OPERATIVES. Consumers Co-operative societies in the United States doubled in number between 1933 and 1936, according to the latest (1938) U.S. Department of Labor Survey—from 188 to 3600, with a corresponding increase in members from 328,278 to 677,750. These Associations were doing an annual business of \$182,685,000. They included 2400 co-operative store associations with 330,500 members and a business of \$107,250,000; 1150 co-operative petroleum associations with 325,000 members and a business of \$69,985,000, and 50 other distributive associations with 22,250 members and business of \$5,450,000.

The typical American co-operative is said to have a membership of from 100 to 250 members. Associations handling petroleum products are mostly in the Mississippi Valley. States with the largest number of co-operatives are Minnesota, Wisconsin, Kansas, Illinois, and Nebraska. Probably two-thirds of total purchases by consumer co-operatives is concentrated in the North Central States.

Although no complete statistics are available, the movement is known to have grown rapidly in 1938 and 1939. According to reliable estimates at the end of 1939 more than 2,000,000 consumers were members of co-operatives doing an annual business of \$600,000,000.

Among the newer co-operative factories and other production units started in 1939 are: a \$750,000 petroleum refinery at Phillipsburg, Kans.; a \$250,000 refinery at Regina, Saskatchewan, Canada; an oil topping and cracking plant at Mount Vernon, Ind.; flour mills at Auburn, Ind., and Outlook, Sask.; feed mills at Manheim, Pa., and Superior, Wis.; commercial fertilizer factories and mixing plants at Baltimore; Indianapolis; Alliance, Ohio; and Maumee, Ohio; a new co-operative cold storage locker plant in Champaign, Ill. A group of co-operatives and credit unions in Indiana purchased a bank in July.

The Co-operative oil refinery in Kansas, capacity 3000 barrels a day, a \$750,000 plant, is the outgrowth of a movement started in 1929 by a group of farmers in and near North Kansas City, Mo., who started a service to six local co-operative gas and oil associations and grew to a \$4,000,000 business in 1938. In all sections of the

United States consumer co-operatives handle approximately \$110,000,000 worth of petroleum products a year.

Co-operative distribution of groceries grew notably in eastern cities when the Eastern Co-operative Wholesale, serving two hundred co-operatives from Maine to Maryland, reached a sales volume of \$1,000,000, as compared with \$533,000 in 1937, and \$717,000 in 1938. An unusual development was the creation of a co-operative chain of eighteen grocery stores in southern Minnesota and Wisconsin which combine the efficiency of chain store operation with the advantages of co-operation. American grocery co-operatives adopted a uniform CO-OP label and adopted government ABC-grade labeling of commodities.

A chain of eight co-operative cafeteria restaurants in New York City, with about 5000 members, are doing business of about 450,000 a year, and serving about a million meals.

Distribution of farm supplies continued to grow. The Farm Credit Administration estimated co-operative purchases at \$440,000,000, one eighth of all United States farm supply purchases.

Co-operative insurance companies handling fire, automobile, and life insurance showed increases of from 18 to 27 per cent for the year. Co-operative credit unions continued to grow throughout the year, reporting 8500 credit unions in the United States having a total membership of 2,225,000. These credit union co-operatives have assets well over \$110,000,000.

Insurance conventions in Boston, Oakland, Indianapolis, Little Rock, and White Sulphur Springs passed resolutions condemning the consumer co-operative movement on the ground that it "aims to increase prices to producers," "to cut prices to consumers," and "establish economic democracy."

B. P. ADAMS.

COPPER. World production, consumption, markets, and prices of this commodity in 1939 were affected primarily by the war economy of Europe, with respect to foreign producers, and by general business conditions in the United States for the domestic industry. In general the year showed a higher degree of activity both at home and abroad than in 1938. World production statistics for 1939 are not available, due to interruption of communications by the war in Europe.

Summary of United States duty-free statistics reported by the members of the Copper Institute are given in the accompanying table. They show increased production and shipments in 1939 over 1938, but a decrease in refined stocks at the year-end.

| | 1938 (short tons) | 1939 (short tons) |
|--------------------|----------------------|----------------------|
| Production | | |
| Crude..... | 644,869 | 836,371 |
| Refined..... | 638,076 | 818,289 |
| Deliveries | | |
| Domestic..... | 481,803 | 814,407 |
| Export..... | 125,869 | 134,152 |
| Refined stocks.... | 289,755 | 159,485 |

Mine production of recoverable copper in the United States in 1939 was about 722,700 short tons, according to preliminary figures of the Bureau of Mines. The output for 1938 was 557,763 tons, indicating an increase in 1939 of 30 per cent. Value of 1939 production was \$150,321,600, compared with \$109,321,466 in 1938. The accompany-

ing table gives mine production of copper in short tons of recoverable metal, 1938-39.

| State or Territory | 1938 | 1939 ^a | % change in 1939 |

^a Preliminary figures.

^b 1938: Georgia, North Carolina, Pennsylvania, South Carolina, Tennessee, and Virginia. 1939: Same States except Georgia and South Carolina.

Copper output in Canada increased 6 per cent in 1939 over 1938, amounting to 606,705,278 lb.

The domestic price for refined electrolytic copper, Connecticut Valley, ranged from 11¼¢ per lb. in January down to 10¢ in June, and up again to 12½¢ from October to the year end, according to *Engineering and Mining Journal*. The annual average price for 1939 was 10.965¢. London prices pursued a similar course until early in September, when the Metal Exchange was closed to trading, and Great Britain practically commandeered copper from Empire producers at a price of £51 per long ton, or about 9¢ per lb. On December 18 the British Ministry of Supply announced a price to consumers of £62 per long ton, equivalent to about 11¢ per lb., on account of the heavy cost of delivery to England from Empire producing countries. No change was made in price to producers.

Consequent on the closing of the London Metal Exchange, the f.a.s. dollar basis, New York export price reflected the open market abroad, rising to 12.90 @ 12.95¢ in November and closing the year at 12.40¢.

Copper and brass fabricators experienced an encouraging recovery of business during the last half of 1939 in marked contrast to conditions prevailing earlier in the year. For the entire year the sales of copper and its alloys increased nearly 50 per cent over 1938, according to the Copper & Brass Research Association. An all-time record was made in the sale of brass pipe and copper water tube for plumbing purposes, in spite of the fact that building construction did not approach previous high records. The principal uses of copper, in order of importance are: electrical manufactures, wire and cable, automobile, light and power lines. See BUSINESS REVIEW; METALLURGY.

On Dec. 21, 1939 the State Department announced in Washington that it had abandoned its announced intention to consider reduction of the import tax of 4¢ per lb. of copper in negotiating the reciprocal trade treaty with Chile.

H. C. PARMELEE.

COPTS. See EGYPT; ITALIAN EAST AFRICA. **COPYRIGHT.** Registrations for the fiscal year 1938-39, according to the report of the U.S. Register of Copyrights, numbered 173,135, as compared with 166,248 for the preceding year. Of these 59,744 were classed as books, but included pamphlets, leaflets, and contributions in periodicals. Those printed in the United States numbered 54,536, those printed abroad in a foreign language,

4086, while the remainder, 1122, were English books registered for ad interim copyright. The chief classes of the remaining registration were: Periodicals (numbers), 38,307; musical compositions, 40,961; dramatic or dramatico-musical compositions, 6800; works of art, models, or designs, 3419; drawings or plastic works of a scientific or technical character, 2863; photographs, 3150; prints and pictorial illustrations, 3126; maps, 1566; lectures, sermons, addresses, 1135; motion pictures not photoplays, 932; motion-picture photoplays, 825; reproductions of works of art, 130. The renewals numbered 10,177 as compared with 9940 in the preceding year. The fees applied during the year amounted to \$306,764. The total number of articles deposited during the fiscal year ended June 30, 1939, was 263,937. The gross receipts of the Register's office for the fiscal year were \$330,466; the total expenditures for salaries, \$266,737, and for supplies, \$1930.

CORN. The corn crop of the United States in 1939 was estimated at 2,619,137,000 bu., 2.2 per cent larger than the 1938 crop of 2,562,197,000 bu. and compared with the 1928-37 (including three drought years) average of 2,309,674,000 bu. The total acreage harvested for all purposes was 88,803,000 acres compared with 92,222,000 acres in 1938, 11 per cent below the 10-year average of 99,798,000 acres, and was the smallest acreage in 41 years. The decrease was attributed to low acreage allotments established by the AAA, low prices, and a large carry-over. Yield per harvested acre averaged 29.5 bu., the highest since 1920, versus 27.8 bu. in 1938, due to favorable conditions in five Corn Belt States resulting from larger acreages of high-yielding hybrids, restriction of corn to more fertile land, favorable growing and maturing weather, and increased use of power machinery. Corn grown for grain was estimated at 2,360,060,000 bu., the 4,243,000 acres harvested for silage produced 31,195,000 tons of silage, and the rest of the crop, about 5,699,000 acres, was harvested for forage or grazed by livestock. States leading in production of corn for grain were Iowa 481,572,000 bu., Illinois 404,404,000, Indiana 204,867,000, Minnesota 167,132,000, Ohio 161,800,000, and Missouri, 118,531,000 bu. Wisconsin, Minnesota, New York, Pennsylvania, and Iowa led in order in silage production. The season average price per bushel received by farmers was 55.9¢ in 1939 and the value of production was estimated at \$1,464,309,000 versus 50.4¢ and \$1,290,423,000 in 1938. See AGRICULTURAL ADJUSTMENT ADMINISTRATION; *Crop Production in 1939* under AGRICULTURE; COMMODITY CREDIT CORPORATION.

CORN BORER. See ENTOMOLOGY, ECONOMIC.

CORNELL UNIVERSITY. A nonsectarian institution for the higher education of men and women in Ithaca, N. Y., founded in 1865. There were 6949 students enrolled in the autumn of 1939, distributed as follows: Graduate school, 853; law school, 207; medical college, the main division of which is in New York City, 292; arts and sciences, 1757; architecture, landscape architecture, and fine arts, 141; engineering, 1236; veterinary medicine, 164; agriculture, 1621; and home economics, 782, including 310 in hotel administration. Of these students, 1499 were women. The 1939 summer session registration was 2062. The faculty, composed of 1691 members, had 50

professors emeritus, 318 professors, 273 assistant professors, 23 lecturers and associates, 464 instructors, and 563 assistants. The productive funds on June 30, 1939, amounted to \$30,872,433. The income applicable to current expenses was approximately \$9,896,038, including \$3,285,431 of State and \$869,540 of Federal appropriations. Gifts amounting to \$1,009,458 were received during the fiscal year. The land and buildings were valued at \$19,692,680, and the equipment at \$8,200,950. The library contained 1,036,404 volumes. President, Edmund Ezra Day, Ph.D., L.L.D. See PHOTOGRAPHY.

CORSICA. An island department of France, in the eastern Mediterranean, 100 miles south-east of Nice. Area, 3367 square miles; population (1936 census), 322,854. Capital, Ajaccio.

COSMETICS. See FOOD AND DRUG ADMINISTRATION.

COSMIC RAYS. See PHYSICS.

COSTA RICA, kōs'tā rē'kā. A Central American republic. Capital, San José.

Area and Population. Area, 23,000 square miles; estimated population on Dec. 31, 1938, 623,414, largely of Spanish and other European descent except for some 18,000 Negroes in the Atlantic banana zone and about 3000 Indian aborigines. Passengers entering the country in 1938 numbered 8090; departures, 7674. Estimated populations of the chief towns in 1938 were: San José, 70,568; Cartago, 20,452; Limón, 16,699; Alajuela, 11,877; Heredia, 9828.

Education and Religion. The illiteracy rate among persons under 18 is very low. In 1938 there were 649 primary schools with 64,413 pupils, three secondary and normal schools with 1860 students, and two colleges. Roman Catholicism is the state religion.

Production. Coffee, bananas, and cacao comprised 84.5 per cent of the 1938 exports. Coffee exports amounted to 21,873,891 kilos (kilo equals 2.2 lb.) ; bananas, 5,033,424 stems; cacao, 5,533,016 kilos. Corn, rice, beans, sugar, fruits, and vegetables are grown for local consumption. Gold (\$554,393 exported in 1938) and salt are the only minerals produced. Manufacturing is confined to the production of a few articles for domestic use.

Foreign Trade. Total imports in 1938 were valued at \$12,620,721 (\$11,878,547 in 1937); exports, \$10,145,614 (\$11,512,097 in 1937). Of the 1938 imports the United States supplied \$6,194,856; Germany, \$2,496,216. Of the exports, the United States took \$4,628,438; United Kingdom, \$2,476,564; Germany, \$1,944,666. Values of the leading 1938 exports: Coffee, \$4,938,053; bananas, \$2,806,547; cacao, \$830,727.

Finance. Governmental revenues in 1938 were 37,491,407 colones; expenditures, 36,337,010, including 5,487,635 colones representing interest on the foreign debt. The ordinary budget for 1939 placed revenues at 30,750,000 colones and expenditures at 31,299,000. A decree of Sept. 8, 1939, provided for the continuance in 1940 of the 1939 budget. The public debt decreased from 144,439,734 colones on Dec. 31, 1937, to 138,639,712 on

Dec. 31, 1938. Average exchange rates of colon (1937 and 1938): Controlled, \$0.1779; uncontrolled, \$0.1770.

Transportation. Costa Rica has 413 miles of railways, 430 miles of roads and trails, and a domestic air network connecting with Pan American Airways. The government-owned Pacific Railway in 1938 carried 235,868 metric tons of freight and earned net profits of 1,615,310 colones. A total of 696 ships of 1,501,435 tons entered and cleared the ports in 1937.

Government. Executive power is vested in a president elected for 4 years and legislative power in a Congress of 44 members, half of whom are elected (for 4 years) every 2 years. President in 1939, León Cortés Castro (Republican National party), who assumed office May 8, 1936.

History. The campaign for the presidential election scheduled for February, 1940, got under way in earnest in 1939 after President Cortés Castro announced on January 31 that he would not seek re-election. The President and his Republican National party, representing Catholic and conservative groups, put forward as their candidate Dr. Rafael Angel Calderón Guardia, president of the Congress. On April 30 the 80-year-old statesman, Dr. Ricardo Jiménez Oreamuno, who had served three terms as President of the republic, accepted the nomination of the opposition liberal elements, but on May 21 he withdrew his candidacy due to "unneutral opposition on the part of the government" and lack of financial support. Four days later President Cortés Castro prohibited political demonstrations by all parties on the ground that they threatened to cause disorders.

On July 14 it was announced that all opposition groups, including the Communists, had agreed to unite behind a single candidate. Leaders of this National Democratic Alliance announced that their objective was to defend Costa Rica's democratic institutions against official infringements. The spread of Nazi and Fascist propaganda and influence and changes proposed in the laws governing elections and the press by President Cortés Castro on May 1 contributed to the unprecedented action of the opposition parties in forming an anti-government united front.

Other internal developments included the gradual elimination, under the decree of Mar. 25, 1939, of the coffee export tax imposed Dec. 22, 1937; imposition on March 10 of a customs surcharge of 100 per cent on imports from countries with which Costa Rica's balance of trade was unfavorable by more than 50 per cent during the preceding calendar year (aimed chiefly at Japan); suspension of service on the debt owed in France and continuance of negotiations for an adjustment of the private United States and British loans. The President in his message of May 1 to Congress reported that the banana concession granted the United Fruit Company in 1938 was resulting in rapid development of a hitherto unproductive and unpopulated region on the west coast.

With the support of the German colony in Costa Rica, the Reich continued its rapid commercial and political penetration previous to the outbreak of the European war in September. German interests undertook to exploit high-cost manganese ore deposits; organized a manila hemp industry; pressed the Costa Rican Government to improve the Puntarenas port works with German materials and technicians; pushed the aski mark

trading device so successfully that the Reich displaced Britain as the chief market for Costa Rican coffee; and won some success in replacing United States interests in the electric power and equipment business. On May 12 Herbert Knorr, the local Nazi leader, was shot and seriously wounded by a prominent Costa Rican Socialist leader, Vicente Sáenz.

Upon the outbreak of war, there were large anti-Nazi demonstrations in San José and other cities. Costa Rican coffee exports to the Reich virtually ceased. Some 2,500,000 marks worth of German goods sold to Costa Rican merchants on credit in anticipation of future coffee shipments were frozen. An active pro-German propaganda, re-inforced by the German colony's boycott of anti-Nazi publications and merchants and marked by efforts to induce the government to curb the local press, aroused much resentment among Costa Ricans.

Two Nicaraguan revolutionary leaders were expelled from Costa Rica during the year for making public attacks upon the Nicaraguan President and Government. Following his visit to the United States, President Somoza of Nicaragua with his wife, daughter and various government officials, visited Costa Rica in the middle of August for the purpose of seeking an agreement with the San José government on the Nicaraguan-United States project for canalization of the San Juan River as the first step toward another inter-ocean canal. The Nicaraguan Foreign Minister returned to San José late in October to continue the negotiations, which had encountered difficulties.

See HONDURAS and NICARAGUA under *History*.
COSTIGAN, EDWARD P (RENTISS). An American lawyer and ex-Senator, died in Denver, Jan. 17, 1939. Born in King William Co., Va., July 1, 1874, he was graduated from Harvard University in 1899, though two years earlier he had been admitted to the Utah bar. He began the practice of law in Denver, Colo., in 1900 and soon became actively interested in the honest administration of the law. He assisted in organizing the Honest Election League (1903-06) and the Law Enforcement League (1906-08), and was chairman of the Dry Denver Campaign Committee in 1910, having been the attorney for the Anti-Saloon League in its local option litigation before the Colorado Supreme Court.

Mr. Costigan was one of the organizers of the Direct Primary League and the Direct Legislation League of Colorado; was a past president of the Civil Service Reform Association of Denver, and an organizer of the Citizens Party in Denver which won the municipal elections of 1912. With the establishment of the Progressive Party in 1912 he left the Republican Party and became a vigorous supporter of the new organization. He was its unsuccessful candidate for governor in the elections of 1912 and 1914.

Returning to the practice of law, Mr. Costigan became the attorney for the Colorado merchants and the Arizona commercial interests in their litigation over freight rates before the Interstate Commerce Commission; represented the United Mine Workers of America during the Congressional investigation of the Colorado coal strike in 1914, and in 1916 he successfully defended the defendants in the murder trials growing out of the strike.

In 1917, Costigan, having espoused the cause of President Wilson, was named a member of the

Interstate Commerce Commission. In 1925 he claimed the Commission had ceased to be a non-political, fact-finding body and his statements were investigated by the Senate. As Congress shelved the report of the investigating commission, Costigan resigned in protest in 1928. He was elected as a Democrat to the U.S. Senate for the 1930-36 term and joined with the liberal bloc advocating public ownership of utilities, unemployment insurance, and old-age pensions. He was co-author of the Jones-Costigan Bill to aid the sugar-beet growers, and with Senator Wagner of New York introduced an anti-lynching bill. He did not seek re-election at the expiration of his term.

COST OF LIVING. See LIVING COSTS AND STANDARDS.

COTTON. The cotton crop of the United States for 1939, as estimated by the U.S. Department of Agriculture on Dec. 8, 1939, amounted to 11,792,000 bales of 500 lb., as compared with 11,943,000 bales in 1938, the crop of 18,946,000 bales in 1937, and 12,399,000 bales in 1936. The average yield of lint per acre was estimated at 235.9 lb., against 226.8 lb. in 1938, the record of 266.9 lb. in 1937, and 190.8 lb. was the 1928-37 average. Of 24,832,000 acres in cultivation July 1, 1939, 3.6 per cent were abandoned later, and 23,928,000 acres were left for harvest, against 24,248,000 acres in 1938. Abandonment exceeded the average, some acreage being removed in compliance with the Agricultural Conservation Program.

World carry-over of American cotton on July 31, 1939, as estimated by New York Cotton Exchange Service, was about 14,030,000 bales, compared with 13,712,000 at the end of the previous season and 6,235,000 two years earlier. The carry-over of American cotton in the United States, estimated at 12,966,575 running bales, together with the above estimate of world total, indicated the carry-over of American cotton in foreign countries on Aug. 1, 1939, at about 1,063,000 bales. World mill consumption of American cotton during the season ended July 31, 1939, was estimated at 11,281,000 bales compared with 10,870,000 bales in 1937-38, and 12,767,000, the 1928-37 average.

The world supply of all cotton for the 1939-40 season was estimated in December to total about 49,300,000 bales, only slightly less than the record supplies of each of the two previous seasons and about one-fifth larger than the 1928-38 average. World carry-over of all cotton on August 1 was about 21,462,000 bales, compared with 22,639,000 bales a year earlier and 14,326,000 bales, the 10-year average.

The prospective world supply of American cotton for the current season, 1939-40, was indicated at about 25,705,000 bales, about 330,000 bales more than in 1938-39 and only slightly less than the high record supply, 26,224,000 bales, of 1932-33. The stocks of spot cotton held as collateral against government loans in late November 1939 were indicated at slightly more than 10,000,000 bales.

Production in 1939 in the countries reported was estimated to be: United States 11,792,000, India 3,660,000, U.S.S.R. 4,050,000, China 2,800,000, Egypt 1,815,000, Brazil 2,000,000, Korea (Chosen) 183,500, Greece 66,000, and Tanganyika 66,000. The total world production in 1939-40 was indicated by the U.S. Department of Agriculture at the close of 1939 at 27,838,000 bales, slightly

above the previous season, and about 800,000 over the 10-year average.

The world production of commercial cotton in 1938 was estimated by the U.S. Bureau of the Census to be 28,221,000 (478 lb.) bales, of which the United States produced 11,623,000 (running) bales; India 5,200,000; U.S.S.R. (Russia) 3,800,000; Egypt 1,728,000; China 1,300,000; Brazil 1,877,000; Peru 390,000; Mexico 250,000, and all other countries 2,053,000 bales. In 1938-39, Argentina produced 304,000 bales; Uganda 253,000 bales; Belgian Congo 161,000 bales, and Anglo-Egyptian Sudan 263,000 bales.

The United States cotton crop for 1938, as reported by the Bureau of the Census, the estimated crop for 1938, and the quantity reported ginned to Dec. 13, 1939, are shown in the accompanying table.

UNITED STATES COTTON CROP, 1938-39

| States | Crop in 1938 500-lb. bales | Crop—1939* 500-lb. bales | Bales ^b ginned Dec. 13, 1939 |
|----------------------|-------------------------------|-----------------------------|--|
| Alabama | 1,081,936 | 780,000 | 767,341 |
| Arizona | 196,164 | 197,000 | 154,592 |
| Arkansas | 1,358,182 | 1,410,000 | 1,353,939 |
| California | 424,532 | 450,000 | 405,495 |
| Florida | 20,867 | 11,000 | 9,621 |
| Georgia | 855,721 | 916,000 | 904,961 |
| Louisiana | 673,520 | 750,000 | 717,668 |
| Mississippi | 1,706,906 | 1,585,000 | 1,532,829 |
| Missouri | 331,434 | 440,000 | 421,516 |
| New Mexico | 93,502 | 97,000 | 83,641 |
| North Carolina | 390,416 | 455,000 | 453,767 |
| Oklahoma | 556,545 | 520,000 | 501,223 |
| South Carolina | 649,132 | 870,000 | 846,830 |
| Tennessee | 487,494 | 450,000 | 428,148 |
| Texas | 3,093,911 | 2,830,000 | 2,667,172 |
| Virginia | 10,812 | 12,000 | 9,920 |
| All Others | 13,266 | 19,000 | 16,887 |
| United States | 11,944,340 | 11,792,000 | 11,275,550 |

* estimated ^b running bales

The table includes for 1939, under the ginning report, 169,424 round bales counted as half bales and also 21,539 bales of American-Egyptian cotton, and 2103 bales of Sea Island cotton. The 1939 crop of Arizona was estimated to include 22,000 bales of American-Egyptian cotton grown on 40,000 acres, and 2600 bales of Sea Island cotton were grown largely in Georgia and Florida.

Cotton of the 1939 crop ginned up to Dec. 13, 1939, averaged slightly lower in grade and shorter in staple compared to that ginned up to Dec. 13, 1938, according to reports based on the 11,251,298 bales of American upland cotton ginned to that date. About 92.6 per cent of the cotton ginned up to Dec. 1, 1939, was tenderable, against 94.6 in 1938.

Oil mills in the United States, during the cotton year ended July 31, 1939, crushed 4,470,516 tons of cottonseed. The products of the seed included 1,113,312 bales of lint, 1,161,079 tons of hulls, 2,023,341 tons of cake and meal, and 1,409,413,537 lb. of oil.

Consumption of all cottons in the United States rose in 1938-39 to 6,858,426 bales from 5,747,978 bales in 1937-38. Cotton used by American mills was consumed largely, nearly 85 per cent, in the cotton growing States. World consumption of cotton (exclusive of linters in the United States) for the year ended July 31, 1939, according to the U.S. Bureau of the Census, approximated 27,748,000 bales compared with 27,050,000 bales in the previous year. Estimates based on reports of the New York Cotton Exchange Service were equivalent to about 28,500,000 bales, about 2,700,000 bales above the average for the 10 years

ended 1937-38. Of the total consumption in 1938-39, about 17,237,000 bales were foreign and 10,870,000 bales American. Consumption of American cotton in countries other than the United States decreased sharply in 1938-39 to slightly more than 4,500,000 bales, while non-American cotton in countries other than the United States totaled 17,100,000 bales.

The price of middling $\frac{7}{8}$ -inch cotton at the 10 spot markets averaged 8.90 cents per pound during the year ended July 31, 1939, compared with 8.70 in 1937-38, 12.70 in 1936-37, and 11.32 cents, the 1928-37 average. Prices averaged in January, 1939, 8.54 cents, February 8.53, March 8.64, April 8.51, May 9.16, June 9.50, July 9.37, August 8.98, September 8.88, October 8.83, November 9.30, and closed on December 29 at an average of 10.76 in the southern spot markets and at 11.36 cents in New York, and 8.70d. at Liverpool. Prices received by producers at local farm markets on Dec. 15, 1939, were estimated to average 9.71 cents per pound for lint and \$24.75 per ton for cottonseed compared with 8.20 cents and \$23.04, respectively, on Dec. 15, 1938. The value of production of cotton lint was estimated at \$524,090,000 in 1939 and of cottonseed \$113,535,000 compared with \$513,638,000 and \$115,690,000 reported in 1938. See BUSINESS REVIEW.

HENRY M. STEECE.

COURT GAMES. See SPORTS.

COURTS, FEDERAL. (Excepting the SUPREME COURT, q.v.). The conviction (June 3) of Martin T. Manton, late senior judge of the U.S. Circuit Court of Appeals, on the charge of conspiring to obstruct justice and thereby to defraud the Government, was an event without precedent in the annals of the Federal bench. Manton, until his resignation before impending disclosures, served in New York City, handling many cases involving great amounts; he had completed 23 years on the bench; and his seniority of service, as well as the magnitude and number of cases arising in his jurisdiction, gave him a standing second only to that of the members of the Supreme Court. The indictment against him specified his participation in transactions involving \$186,000, connected with eight matters, including purported loans from banks. It was stated at the time of his conviction that no judge of the U.S. Court of Appeals had previously been found guilty of selling justice.

Manton was tried in New York, before Federal District Judge Calvin W. Chesnut of Baltimore, specially assigned by the Chief Justice. John T. Cahill, U.S. Attorney, prosecuted; under commission as special assistant to the Attorney-General he had obtained the indictment. He brought testimony of numerous witnesses, some of them originally co-defendants but now giving Government evidence, to show that Manton and his associates had not merely accepted monetary inducements for favorable action on the Court's part but had pressed payments from parties, by working on victims' fear of hostile treatment in court. Manton was sentenced (June 20) to serve two years in a Federal prison and to pay a fine of \$10,000. Appealing from the conviction, he took his case to a specially constituted court composed of retired Justice Sutherland of the Supreme Court, Justice Stone of that court, and Judge Charles E. Clark of the Circuit Court; this tribunal, after hearing the appeal, unanimously upheld the conviction (December 4).

Among the effects of the conviction of Manton, one of the most direct was the doubt cast on the merit of a number of decisions that he had rendered. Thus his decision in a case, involving a mortgage, between the 671 Prospect Avenue Holding Corporation and the East River Savings Bank, of New York, was declared by a Circuit Court (July 2) to be void. Another Federal Judge, Edwin S. Thomas of the District Court, serving in Connecticut, resigned from the bench in advance of Manton's trial and was mentioned in the prosecution, in connection with a specified sum alleged to have been collected by Manton.

Creation of a Court Proctor. A measure passed by Congress and signed (August 7) by the President created the office of Court Proctor, to be filled by a person named by the Supreme Court; his pay was to be \$10,000 a year. An assistant, chosen in the same way, was to receive \$7500. The Proctor was authorized to supervise the fiscal operations of all the Federal courts; subject to the will of the Chief Justice, he was to direct the employment, discharge, and payment of these courts' officers. Such duties of business management had previously been performed by the Department of Justice.

Courts' Decisions. A great number of rulings relating to the contentions between the NLRB and the labor unions or the employers were made in the course of the year; some in which there followed determinations by the SUPREME COURT are noted under that title; other decisions, of particular local significance, under appropriate States.

Among decisions of general public interest were those of the Court of Appeals of the District of Columbia, sustaining (August 4) the action of certain steel-making companies against an order of the Department of Labor requiring wages to be paid according to rates set separately for localities—six for the entire United States—as a requisite qualification to obtain Government contracts; the same court ruled, in the WMEX-Yankee-Network case that the Federal Communications Commission, in granting licenses to broadcast, must consider the effects that this may produce in competition between stations. A Circuit Court's decision in Chicago (July 17) set aside an order of the Secretary of Agriculture to Swift and Company, packers, to cease from allegedly unfair practises, involving grants of longer credit to some purchasers, such as institutions.

A matter affecting growers of cotton was handled in a District Court's decision in western Texas, rendered in July: the Government suing farmers who had borrowed on their cotton in 1935 and later sold the cotton but failed to repay the loans, the Court held applicable the statute of limitations that would have barred an analogous suit by a private creditor. The District Court of the District of Columbia dismissed (July 26) a prosecution that the Department had brought against the American Medical Association and other associations and individuals, in the endeavor to bring the medical groups under Federal discipline as a monopoly; the ruling rested on the ground that medicine did not properly constitute trade. In Tennessee, a Federal District Court dismissed (August 11) the action brought by Dr. Arthur E. Morgan, former chairman of the TVA (see YEAR BOOK, 1938, pp. 748-9) against his removal, holding that the

President had full power of removal from this office.

CRISTEA, PATRIARCH MIRON. A Rumanian ecclesiastic, died at Cannes, France, Mar. 6, 1939. Born in Toplitz-Romana, Transylvania, in 1868, he studied at Hermannstadt in Transylvania, and received a degree from the Budapest University in 1895. Appointed secretary to the Metropolitan of Hermannstadt, in 1902 he joined the monastic order of Hodoss-Bodrog, and from 1890 until 1900 he edited *Telegraful Roman*, the organ of the Orthodox Church in Transylvania, and was a leading champion of Rumanian rights. He served as Bishop of Caransebesch from 1909 to 1919, and in the latter year was named Metropolitan Primate of Rumania. He was named First Patriarch of the Rumanian Orthodox Church in 1925. An organizer of Rumanian church and monastery life, he assisted in negotiating for *rapprochement* between the Church of England and the Apostolic Orthodox Church.

After the death of Ferdinand I in 1927, the Patriarch was appointed one of the three Regents who served until 1930 when King Carol ascended the throne. On Feb. 11, 1938 he was invited to become Premier of Rumania by the King and served until his death. See **RUMANIA** under *History*.

CROSLEY, REAR ADMIRAL WALTER SELWYN, U.S.N., RET. An American hydrographer, died in Baltimore, Jan. 6, 1939. He was born in East Jaffrey, N. H., Oct. 30, 1871 and was graduated from the U.S. Naval Academy in 1893. During his long naval service—he retired in 1935—he participated in the Brazilian Revolution (1893), the railroad riots in California (1894), the Spanish-American War (1898), the Philippine Insurrection (1900), the Dominican Occupation (1916), and the World War (1917–18). Naval attaché at Constantinople (1910–12), Petrograd (1917–18), and Madrid (1918), he became commandant of the 7th Naval District, Key West, Fla. (1921), the 9th Naval District at Chicago (1929–32), and the 15th Naval District at Balboa, C. Z., (1933–35).

During 1925–27 Crosley was hydrographer of the Navy and directed surveys of Cuban and

Central American waters. Promoted to rear admiral in 1927 he was given command of Squadron No. 1 of the Fleet Base Force. During 1932–33 he was commander of Battle-Ship Division 3. He was a delegate to the International Hydrographic Conferences of 1926 and 1929 and in August, 1937, was appointed resident director of the International Hydrographic Bureau at Monaco. He retired in June, 1938.

CROSS-COUNTRY RUNNING. See **SPORTS**.

CRUSTACEA. See **ZOOLOGY**.

CUBA. An island republic of the West Indies. Capital Havana (Habana).

Area and Population. Area, 44,164 square miles; estimated population on Dec. 31, 1938, 4,227,587 (about 60 per cent white, 40 per cent Negro). During 1933–37 a total of 262,725 passengers entered Cuba and 316,815 departed. Estimated populations of the chief cities, including suburbs, on Dec. 31, 1936: Havana, 552,133; Holguin, 137,016; Camagüey, 135,126; Santiago de Cuba, 104,729; Santa Clara, 98,183; Marianao, 84,357; Moron, 83,291; Matanzas, 80,954.

Defense. The army comprises about 16,500 officers and men; the navy, 2650 men with 5 gunboats, 2 escort vessels, 1 armed transport, and about 12 coastguard vessels; the air force, about 116 men and 16 airplanes.

Education and Religion. The 1931 census showed 39 per cent of the adult population to be illiterate. Enrollment in 4115 primary schools in 1937–38 was 423,420 pupils (312,972 white, 110,478 colored). Special government institutes for secondary education are maintained in each province. The University of Havana has about 6000 students. Roman Catholicism is the dominant religion but there is no state church.

Production. Agriculture is the chief occupation. Sugar accounted for 69.9 per cent of the value of all 1938 exports. Sugar production in 1938 was 2,975,683 tons (of 2240 lb.) valued at \$96,650,090 (2,970,997 tons worth \$117,062,035 in 1937). The 1939 sugar quota was fixed at 2,696,517 tons. Tobacco production in 1938 was 25,100 metric tons; coffee (1938–39), 30,700 metric tons. Corn, cacao, rice, fruits, and vegetables are other leading crops. There were 4,964,000 cattle and 695,000 horses, mules, and asses in 1936. Leading manufactures are vegetable oils, meat products, clothing, footwear, furniture, textiles, paints, paper, glass, cement. Foreign tourists and excursionists arriving at Havana in 1938 numbered 158,013 (178,396 in 1937). The 1938 mineral production was: Iron ore, 152,099 gross tons (shipments); crude chromite, 40,163 metric tons (shipments to United States); manganese ore, 123,844 metric tons; copper ore, 341,184 tons (1937).

Foreign Trade. Cuban imports in 1938 were \$106,077,325 (\$105,860,703 in 1939); exports, \$142,677,752 (\$147,676,258). The United States supplied 70.8 per cent of the 1938 imports (74.4 in 1939) and took, 70.8 per cent of the exports (72.4 in 1939). See **IMPORTS AND EXPORTS**. Values of the leading 1938 exports: Raw sugar, \$82,397,000; refined sugar, \$17,374,000; molasses, \$11,552,000; leaf tobacco, \$10,478,000.

Finance. By law of Nov. 2, 1938, the fiscal year ending June 30 was changed to coincide with the calendar year. Budgetary collections for 1937–38 were 77,886,000 pesos; expenditures, 78,554,000. The budget for the calendar year 1939 estimated revenues at 76,000,000 pesos and expenditures at 75,992,000. The Treasury Depart-

ment reported the public debt on Mar. 31, 1939, at \$141,086,000 (\$132,953,000 on Mar. 31, 1938). The 1939 figure was divided as follows: External, \$111,216,000; internal, \$7,517,000; sugar debt, \$2,353,000; public works debt, \$20,000,000. The Cuban peso was about equal to the U.S. dollar in 1938. The 1940 budget estimates were: Revenues, 76,000,000 pesos; expenditures, 75,985,000 pesos.

Transportation. Cuba in 1939 had about 3079 miles of railway lines, excluding some 5650 miles of private lines on sugar estates. Improved highways extended about 2230 miles. Incoming Pan American Airways planes in 1938 carried 15,335 passengers, 46,010 lb. of mail, and 49,236 lb. of express. Outgoing planes carried 14,906 passengers, 38,867 lb. of mail and 11,338 lb. of express.

Government. Cuba at the beginning of 1939 was governed under the Constitution of June 12, 1935 (see 1935 YEAR BOOK, p. 189). There was a Senate of 36 members and a House of Representatives of 162, both controlled by supporters of the government headed by President Federico Laredo Bru. Formerly Vice President, Laredo Bru was sworn in as President Dec. 24, 1936, following the impeachment of President Miguel Mario Gómez. For developments in 1939, see *History*.

HISTORY

Constituent Assembly Elected. A freely elected Constituent Assembly to draw up a new Constitution had been the goal of most Cuban political parties since the "sergeants' revolt" of 1933 made Fulgencio Batista Chief of Staff of the army and the dominant political power in the republic. This objective was attained with Batista's collaboration on Nov. 15, 1939. In one of the most impartial elections ever held in Cuba, the 76 members of the Constituent Assembly were elected out of 816 candidates submitted by 11 parties.

The main issue of the election was support of or opposition to the Laredo Bru Government. The administration represented the parties collaborating with Colonel Batista and for the most part pledged to support him for President in the general election to be held under the Constitution framed by the Constituent Assembly. Both government and opposition parties formed loose coalitions during the electoral campaign. The election was a victory for the opposition groups, which captured 41 seats against 35 by the government parties.

The strength of the opposition in the Constituent Assembly was distributed as follows: Cuban Revolutionary party (leader, ex-President Ramón Grau San Martín), 18; Democratic Republicans (leader, ex-President Mario G. Menocal), 15; ABC (leader, Dr. Joaquín Martínez Sáenz), 4; Republican Action (leader, ex-President Miguel Mariano Gómez), 4. The standing of the government parties was: Liberals (leader, Alfredo Hornedo y Suárez), 16; Nationalists (leader, Dr. José E. Bringuier Laredo), 9; Communist Revolutionary Union (leader, Juan Marinello Vidaurreta), 6; National Democrats (leader, Dr. Félix del Prado), 3; National Realists, 1.

The months prior to the election were marked by several revisions of the electoral law, which had at first barred some of the opposition groups, and by repeated postponements of the election date, originally set for August 30. There were repeated charges by opposition parties that Colo-

nel Batista was attempting to rig the electoral machinery and use the army's influence on behalf of the government candidates with a view to promoting his Presidential ambitions. But the conduct of the elections and the opposition victory nullified these criticisms. On April 21 Batista asserted: "If it is necessary for me to become President, I shall enter the campaign on an equal basis with other candidates and shall expect to win only by the vote of the people."

A law setting Feb. 28, 1940, as the date for the general elections was passed May 25, 1939. A bill paving the way for Batista's entrance into the Presidential race was approved on November 28. It made possible his temporary retirement as Chief of Staff and the reorganization of the army to reduce defense expenditures to a level commensurate with the national income. The results of the Constituent Assembly elections, however, were considered a severe blow to Batista's Presidential aspirations. Nevertheless he resigned as Chief of Staff on December 6 and on December 10 was proclaimed as candidate of all the parties represented in the government coalition.

Meanwhile the meeting of the Constituent Assembly, scheduled for December 15, was indefinitely postponed due to controversies that made it impossible to certify a quorum of delegates. One dispute involved the multiple seats to which some of the opposition leaders were elected. The government parties contended that the extra seats should be declared vacant, thus giving the government a majority in the Constituent Assembly. However the Superior Electoral Tribunal ruled that delegates to the Assembly elected in more than one province might resign their extra seats in favor of substitutes, and this ruling was upheld by the Cuban Supreme Court on December 15.

Other controversies arose from the opposition demand that the general elections set for Feb. 28, 1940, be postponed until after the Constituent Assembly had drawn up a new Constitution. The opposition also insisted that the Constituent Assembly had sovereign powers and that the existing Congress should resign when the Assembly convened, while opposition leaders held that the Constituent Assembly's powers were limited to framing a new Constitution. No settlement of these issues was in sight at the year end.

Batista's Policies and Problems. During 1939 Colonel Batista continued the Leftist policy he had adopted in 1938 in an effort to widen popular support of his indirect dictatorship (see 1938 YEAR BOOK, p. 189 f.). His visit to Mexico during Feb. 3-12, 1939, aroused enthusiasm among the Cuban laboring classes but was severely criticized by commercial, industrial and middle class elements. It was widely believed that the visit might result in the espousal by Batista of the expropriation measures adopted in Mexico (q.v.). But the army chief on his return to Havana assured capital that there would be "no spoliation of property" and stated that his policy would be "slightly Left of center," avoiding both communism and fascism. Rejecting proposals for a Mexican-Cuban front against the United States, he advocated a "Washington-Havana-Mexico City axis" against European ideologies.

Conservative elements, however, continued to regard with suspicion and alarm the legislative and other measures sponsored by Batista and his adherents. Some of these measures were declared confiscatory and ruinous to Cuba's credit and economic prosperity. Among them were the law

published March 25 regulating and controlling dwelling house rentals; the bill for liquidation of the mortgage moratorium which scaled mortgage interest rates down to 3 per cent or lower; the banking and monetary legislation and higher taxes proposed by the President in a message to Congress; the President's request late in June that Congress authorize coining of an additional 15,000,000 silver pesos to balance the 1939 budget and meet other expenditures out of the seignorage; a law requiring Cuban exporters to deposit with the Treasury 10 to 20 per cent of their dollar exchange for Cuban silver; and the decree of July 6 prohibiting unauthorized increases in foodstuff prices above the level prevailing on July 1.

Some of these measures were designed to balance the budget and check the depreciation of the Cuban peso, which was attributed mainly to undue expansion of the currency. But they failed to produce the results anticipated by the government. The request for coining of additional pesos in June caused a drastic slump in the exchange value of the peso and the request was hastily withdrawn. In its place was adopted new tax measures and a bill making internal dollar obligations payable in pesos with certain exceptions. The foodstuffs price control bill was rescinded, and the highly controversial mortgage moratorium liquidation bill, that had been repeatedly endorsed by Colonel Batista, was vetoed by President Laredo Bru on October 16 on the ground that it did not embody the army leader's ideas.

Effect of European War. With the outbreak of the European war on September 1, Cuba experienced a speculative boom in anticipation of a rapid rise in sugar prices similar to that which had produced the famous "dance of the millions" during and after the World War. The sugar boom collapsed when the United States Government on September 11 cancelled its sugar import quota system, thus automatically raising the duty on Cuban sugar from 90 cents to \$1.50 per 100 lb. Cuban producers placed their main hope for improved conditions upon the reopening of the U.S. market on a permanent quota basis. These developments spurred negotiations for a revision of the United States-Cuban reciprocity treaty, which had been hanging fire since the preceding December. On December 18 an agreement supplementing and amending the reciprocity treaty was signed at Washington. It was immediately ratified by the Cuban Congress and went into effect December 23. The new agreement restored the former U.S. duty of 90 cents per 100 lb. on Cuban sugar in return for further tariff concessions by Cuba.

Foreign Relations. Outside of Colonel Batista's visit to Mexico, the principal developments of the year were the tightening of relations with the United States and the other American republics as a result of the European conflict; the refusal of the Cuban Government to permit the landing of 917 Jewish refugees from the German liner *St. Louis*, which arrived at Havana late in May; and the belated recognition of the Franco regime in Spain on May 25. There was considerable agitation among liberal and Leftist groups in Cuba against propaganda by Spanish Fascists. On April 25 the Minister of Government decreed the dissolution of the Cuban branch of the *Falange Española* for "anti-Cuban" activities. It was charged that a Falangist speaker had

advocated restoration of Spanish rule in the island. The Senate on March 21 approved a resolution conferring on President Franklin D. Roosevelt the title "Eminent Citizen of America." An agreement concluded with Italy on Jan. 16, 1939, provided that Cuban imports into Italy were to be maintained at a value of not less than 50 per cent of the value of Italian imports into Cuba.

CUMBERLAND PRESBYTERIAN CHURCH. See PRESBYTERIANS; RELIGIOUS ORGANIZATIONS.

CURAÇAO, kōō'rā-sā'ō or kū'ra-sō'. A colony in the Netherlands West Indies comprising two groups of islands (1) Aruba, Bonaire, Curaçao, just north of Venezuela (2) Saba, St. Eustatius, St. Martin (southern part only), just west of the Virgin Islands. Total area, 403 square miles; estimated population (Jan. 1, 1938), 95,000. Capital, Willemstad on the island of Curaçao, 28,350 inhabitants (1937). Education (1936): 49 schools and 12,474 pupils.

Production. Maize, pulse, cattle, salt, and phosphate of lime (102,000 metric tons exported in 1937) are the chief products. The refining of imported crude oil (from Venezuela and Colombia) is the chief industry (22,261,000 metric tons of refined oils were produced in 1938). Trade (1938): (values in old U.S.A. gold dollars), imports, \$129,900,000; exports, \$110,700,000. Air services by K.L.M. (Royal Air Traffic Company of the Netherlands) link Barbados, Colombia, Netherlands Guiana, Netherlands West Indies, Trinidad, Venezuela, and give connections with Pan American Airways to the United States and greater South America.

Government. Budget (1936): revenue, 7,969,000 florins; expenditure, 7,964,000 florins (florin averaged \$0.6448 in 1936; \$0.5505 in 1937; \$0.5501 in 1938). The colony is administered by a governor, aided by a privy council of 4 members and a colonial council of 13 members all nominated by the Queen. Governor, C. J. J. Wouters (appointed on Apr. 7, 1936).

CURLING. See SPORTS.

CURRENCIES, VALUE OF FOREIGN. The legal estimates of the value of foreign moneys on Jan. 1, 1940, as issued by the U.S. Secretary of the Treasury, are given in the table on page 178.

See FINANCIAL REVIEW; INTERNATIONAL BANKING; MONEY; UNITED STATES.

CUSHING, HARVEY (WILLIAMS). An American surgeon, died in New Haven, Conn., Oct. 7, 1939. He was born in Cleveland, Ohio, Apr. 8, 1869, and was educated at Yale University (A.B., 1891) and at Harvard University (M.D., 1895). After four years at Johns Hopkins University Hospital in Baltimore, he studied in Switzerland and in England. From 1902 to 1912 he was associate professor of surgery at Johns Hopkins, when he joined the staff of Harvard University as professor of surgery, also becoming surgeon-in-chief of the Peter Bent Brigham Hospital in Boston. He was retired from both these offices on Sept. 15, 1932 and became Moseley Professor of Surgery, emeritus, having reached the legal retirement age of surgeons in Massachusetts. He also retired from active practice in that year, having for 37 years been engaged in his profession. His retirement, however, was not complete, for in September 1933, he accepted the newly-created Sterling professorship of neurology at Yale University. He was retired as emeritus professor in 1937.

VALUES OF FOREIGN MONETARY UNITS — JAN. 1, 1940

| Country | Monetary Unit | U.S. Money | Remarks |
|--------------------------|----------------------|------------|--|
| Argentine Republic | Peso | \$1.6335 | Valuation is for gold peso. Paper nominally convertible at 44% of face value. Conversion suspended Dec. 16, 1929. |
| Australia | Pound | 8.2397 | Control of gold stocks and exports authorized Dec. 17, 1929. |
| Belgium | Belga | .1695 | By decree of Mar. 31, 1936, 1 belga = 5 Belgian francs. |
| Bolivia | Boliviano | .6180 | Conversion of notes into gold ended Sept. 23, 1931. |
| Brazil | Milreis | .0606 | Based upon official rate for milreis in terms of the dollar as announced by the Bank of Brazil. Conversion of Stabilization-Office notes into gold ended Nov. 22, 1930. |
| British Honduras | Dollar | 1.6931 | Conversion of notes suspended. |
| Bulgaria | Lev | .0122 | Exchange control established Oct. 15, 1931. |
| Canada | Dollar | 1.6931 | Embargo on export of gold, Oct. 19, 1931; redemption of Dominion notes in gold suspended Apr. 10, 1933. |
| Chile | Peso | .2060 | Given valuation is of gold peso. Gold pesos are received for conversion at the rate of 4 paper pesos for 1 gold peso. Conversion of notes suspended July 30, 1931. |
| China | Yuan | | Silver standard abandoned, Nov. 3, 1935; bank notes legal tender under Currency Board control; exchange rate for British currency fixed at 1s. 2½d., or 29½¢ U.S., per yuan. |
| Hong Kong | Dollar | | Treasury notes and notes of the three banks of issue made legal tender by silver nationalization ordinance, Dec. 5, 1935; exchange fund created to control exchange rate. |
| Colombia | Peso | .5714 | Obligation to sell gold ended Sept. 24, 1931. Gold content of .56424 gram of gold 9/10 fine made effective Nov. 30, 1938. |
| Costa Rica | Colon | .7879 | Conversion of notes into gold suspended Sept. 18, 1914; exchange control established Jan. 16, 1932. |
| Cuba | Peso | 1.0000 | By law of May 25, 1934. |
| Czecho-Slovakia | Koruna | | Conversion of notes into gold suspended Sept. 29, 1931. |
| Denmark | Krone | .4537 | U.S. money is principal circulating medium. |
| Dominican Republic | Dollar | 1.6931 | Conversion of notes into gold suspended Feb. 9, 1932. |
| Ecuador | Sucre | .3386 | Conversion of notes into gold suspended Sept. 21, 1931. |
| Egypt | Pound (100 piasters) | 8.3692 | Conversion of notes into gold suspended June 28, 1933. |
| Estonia | Kroon | .4537 | Conversion of notes into gold suspended Oct. 12, 1931. |
| Finland | Markka | .0426 | Provisions of monetary law of Oct. 1, 1936, providing for gold content of franc, superseded by decree of June 30, 1937, which stated that the gold content of the franc shall be fixed ultimately by a decree adopted by the Council of Ministers. Pending such decree a stabilization fund shall regulate the relationship of the franc and foreign moneys. |
| France | Franc | | Piaster pegged to French franc at rate of 1 piaster = 10 French francs; exchange of notes for gold ended Oct. 2, 1936. |
| French Indo-China | Piaster | | Exchange control established July 13, 1931. |
| Germany | Reichsmark | .4033 | Sale of gold at legal monetary par suspended Sept. 21, 1931. |
| Great Britain | Pound Sterling | 8.2397 | Conversion of notes into gold suspended Apr. 26, 1932. |
| Greece | Drachma | .0220 | Conversion of notes into gold suspended Mar. 6, 1933. |
| Guatemala | Quetzal | 1.6931 | National bank notes redeemable on demand in U.S. dollars. |
| Haiti | Gourde | .2000 | Gold exports prohibited Mar. 27, 1931; lempira circulates as equivalent of half of U.S. dollar. |
| Honduras | Lempira | .8466 | Exchange control established July 17, 1931. |
| Hungary | Pengő | .2961 | Sale of gold at legal monetary par suspended Sept. 21, 1931. |
| India (British) | Ruppee | .6180 | Obligation to pay out gold deferred Mar. 13, 1932; exchange control established Mar. 1, 1936. |
| Iran (Persia) | Rial | .0824 | Conversion of notes into gold suspended Sept. 21, 1931. |
| Ireland | Pound | 8.2397 | New gold content of 46.77 milligrams of fine gold per lira established by monetary law of Oct. 5, 1936. |
| Italy | Lira | .0526 | Embargo on gold exports Dec. 13, 1931. |
| Japan | Yen | .8440 | Money pegged to sterling Sept. 28, 1936, 2,522 lati = £100. |
| Latvia | Lat | | British money is principal circulating medium. |
| Liberia | Dollar | 1.6931 | Free export of gold suspended Oct. 1, 1935. |
| Lithuania | Litas | .1693 | Decree of Aug. 28, 1936, left the monetary unit, the peso, to be later defined by law. |
| Mexico | Peso | | Suspension of convertibility of notes into gold and restrictions placed on free gold exports—Sept. 26, 1936; gold export prohibition repealed by decree June 28, 1938. |
| Netherlands and colonies | Guilder (florin) | .6806 | Newfoundland and Canadian notes legal tender. |
| Newfoundland | Dollar | 1.6931 | Exchange of notes into gold suspended and export of gold curbed, Aug. 5, 1914; exchange regulations December, 1931. |
| New Zealand | Pound | 8.2397 | Embargo on gold exports Nov. 13, 1931. |
| Nicaragua | Cordoba | 1.6933 | Conversion of notes into gold suspended Sept. 29, 1931. |
| Norway | Krone | .4537 | U.S. money is principal circulating medium. |

* At par as regards gold units; nongold units have no fixed par with gold.

One of the world's outstanding neurologists, Dr. Cushing made many pioneer contributions to medicine, and the name Harvey Cushing became almost synonymous with brain surgery. He was one of the first advocates of the use of the X-ray, and one of the first to introduce the use of blood-pressure determinations in the United States. In 1932, he described a new clinical entity, "pituitary basophilism," known as "Cushing's disease." He was a lifelong student of the diseases of the ductless glands, and his *The Pituitary Body and Its Disorders* (1912) was a classic of clinical medicine.

Dr. Cushing's accomplishments brought him many honors, including the Charles Mickle Fellowship of the University of Toronto (1924) as one who did "most during the previous ten years to advance sound knowledge of a practical kind in medical art or science." He received the Cameron prize of the University of Edinburgh in 1924, the Lister medal of the University of London in 1930, and the gold medal of the National Institute of Social Sciences in 1935. An active member of many scientific societies, he was president of the American College of Surgeons (1923) and of the American Surgical Association (1927), and was the recipient of honorary degrees from American and European universities.

In 1915, Dr. Cushing went to France with a Harvard ambulance unit, and during 1917-19 he saw service with the British Expeditionary Forces. He was director of U.S.A. Base Hospital No. 5 and was a consultant in neurological surgery to the American Expeditionary Forces. For his War work he received the Distinguished Service Medal (U.S.), the French Legion of Honor, and was made a Companion of the Bath. During the hostilities he kept a voluminous diary, parts of which were published in 1936 as *From a Surgeon's Journal*.

A frequent contributor of papers to the scientific press, dealing especially with neurological surgery, he wrote *Tumors of the Nervous Acusticus* (1917), *A Classification of the Gliomata* (1925) with P. Bailey, *Intracranial Tumours* (1932), *Pituitary Body and Hypothalamus* (1932), and *The Meningiomas* (1938), with L. Eisenhardt. Also, he published a two-volume *Life of Sir William Osler* (1925) which received the Pulitzer Prize as the outstanding American biography of the year, and *Consecratio Medici and Other Essays* (1928).

CUSTOMS SERVICE. The Customs Service, the first governmental agency provided by the first Federal Congress, celebrated on Aug. 1, 1939, the sesquicentennial of its organization. Although its primary function is now and has always been the collection of duties on imports, it is also charged with many other responsibilities, such as the enforcement of laws relating to vessels and navigation, the registering and licensing of vessels, the regulation of the movement of commodities, persons, vessels, aircraft, and land vehicles between the United States and foreign countries, and the supervision over and restriction of imports and exports. Its functional growth and the increase in its personnel during the 150 years of its existence paralleled roughly the growth in the area and population of the United States, but the progressive development of this country has been only one of the factors influential in determining the amount of duties collected; variations in tariff policy, changes in economic conditions in this and other countries,

and the unusual demand for certain products because of droughts, wars, etc., have been of equal if not greater importance in their effect on the customs revenue. Collections by the Customs Service, in consequence, although manifesting a generally upward trend during the past century and a half, have fluctuated rather sharply from year to year.

Customs Collections. During the fiscal year 1939, the amount collected as customs duties totaled \$319,241,136, or little more than half the collections of a decade before, which were the largest in customs history. In addition to duties which constituted the major portion of the collections, \$2,168,859 was secured from fines and other miscellaneous customs collections, and \$28,985,949 was collected for other governmental agencies, so that total collections by the Customs Service aggregated \$350,395,944 in 1939, as compared with \$392,095,464 in 1938.

There was comparatively little fluctuation in the collections from month to month during the year, the difference between the maximum and minimum monthly collections being smaller than for any but one year of the past decade (1936). The usual seasonal factors were responsible for the peaks in October 1938 and May 1939, but the large April total was due to heavy importations of German merchandise immediately preceding the imposition of countervailing duties on April 23, 1939.

All but 4 of the 15 dutiable tariff schedules participated in the general decline in customs collections. Contrary to the general trend, however, the rayon schedule yielded the largest returns ever recorded, although the total collections under this schedule were of minor consequence. Increased collections also accrued from commodities covered by the chemical, tobacco, and wool schedules, the increase in the latter case being due to unusually low importations of raw wool during 1938, rather than to particularly large importations in 1939. Agricultural commodities, liquors, and sugar, which are of greater importance as sources of customs revenue, each yielded smaller returns than during the previous year.

The Tariff Act of 1930 provides for three types of duties,—specific, ad valorem, and compound, the latter being a combination of the other two. During the fiscal year 1939 the value of goods dutiable at specific rates aggregated \$502,000,000, or 61 per cent of the total value of dutiable imports, while the value of imports dutiable at ad valorem and at compound rates represented 33 and 6 per cent, respectively, of the total.

Almost half of the total duties collected during 1939 consisted of duties on imports from Europe, among which the United Kingdom was by far the most important as a source of customs revenue. Duties on British products were more than double those derived from goods imported from any other European country, and were slightly greater than the amount received as duties on imports from Cuba. More than half of the total duties collected on imports from all the North and Central American countries came from duties on Cuban imports—chiefly sugar and tobacco. Duties collected on Canadian imports were considerably smaller than in 1938 due to a 50 per cent decrease in imports of distilled liquors from Canada. Argentina, which supplies the United States with large quantities of flaxseed and canned beef, is by far the most important among

South American countries as a source of customs revenue. The sharp decline in duties on imports from that country in 1939 was due to the cessation of imports of corn, which were quite large during the first few months of the fiscal year 1938. Duties on the products of most of the important countries declined from the previous year but, contrary to the general trend, increases were recorded on duties collected on imports from Germany, France, Turkey, Switzerland, Greece, and Mexico. In the case of Germany, the increase was due to the flood of imports immediately prior to the imposition of countervailing duties on April 23, 1939, and to the inclusion in the German total for 1939 of goods previously listed as Austrian.

VALUE OF DUTIABLE IMPORTS AND COMPUTED DUTIES COLLECTED BY THE UNITED STATES, FISCAL YEARS ENDED JUNE 30th, 1938 AND 1939

[In millions of dollars]

| Country | Value | | Duties | |
|-----------------|-------|------|--------|------|
| | 1938 | 1939 | 1938 | 1939 |

Import Restrictions. The wave of protectionism which swept over the world markets during the early part of the decade, found expression in three methods for the restriction of international trade—tariff increases, quotas, and exchange restrictions. These devices, in so far as they have been used in the United States, have been employed only to a limited degree. The latter form of restriction has not been used at all in this country, although extensively employed abroad. Since the passage of the Tariff Act of June 17, 1930, the first expedient has been employed in this country only in the form of taxes on imports included in the general revenue acts, and has been applied only to a very limited number of commodities. Quotas, moreover, have been employed by the United States as a tariff measure in only a comparatively few cases. The amount of import taxes collected in the fiscal year 1939 totaled \$14,971,061, as compared with \$14,825,087 in 1938. Of this amount, \$10,212,600 was collected on duty-free articles and \$4,759,461 on dutiable articles.

All import quotas, except those covering sugar other than Philippine, are administered by the Customs Service. These have been applied in only three ways—first as a limitation on the importation from the Philippines of a few conditionally free commodities in anticipation of the ultimate independent status of that region, second as a part of the trade agreement program in conjunction with a reduction in the rates of duty previously effective, and third to limit the importation of a commodity on which export subsidies are paid under the agricultural adjustment program. Only two of the quotas, those on Philippine cordage and red cedar shingles, established

an absolute limitation on importations. The other quotas provided that any importations in excess of the quota quantities would be dutiable at the rates specified in the tariff act. A recent departure in the administration of import quotas is the allocation of the quotas by countries. The first such allocation was made effective April 1939 in the case of the quarterly quota on beef cattle, and this method was also followed in the cotton and cotton waste, petroleum, and silver fox quotas.

Vessel, Vehicular, and Airplane Traffic. In order to perform properly the primary function of the Customs Service in collecting revenue on imports, customs officers examine the baggage and other belongings of all persons entering this country, as well as the means of transportation by which their arrival is effected. This necessitated, during the fiscal year 1939, the examination of 11,643,237 automobiles and busses, containing 33,519,803 passengers; 32,455 documented vessels, and 33,427 passenger trains, each class of which brought slightly more than 1,000,000 passengers into this country; and 132,328 ferries which carried 2,209,600 passengers. In addition, 10,578,528 pedestrians entered the country, 1,524,621 arrived by streetcars and other vehicles, 104,166 by undocumented vessels, and 52,786 in aircraft. The total number of persons entering this country from abroad aggregated 50,089,787 during 1939, a decrease of 2,797,231 from the previous year.

Ferry traffic exhibited a sharp decline from the previous year due to changed conditions at two border points, the discontinuance in July 1938 of the Detroit-Windsor ferry service and the completion in August 1938 of the Thousand Islands Bridge across the St. Lawrence, both of which caused a diversion of traffic formerly arriving by ferry. Although fewer persons arrived from abroad by air than by any other means, this form of transportation continued to increase in popularity, even though most of the other methods of transportation declined. More than half the total passengers by air arrived in this country at the port of Miami, Fla., and increases in number of airplane passengers were also recorded at most of the points along the Canadian border. On the other hand, airplane traffic from Mexico declined.

Enforcement of Customs Laws. Most of the customs collections other than duties consist of penalties imposed for attempts to evade customs requirements. Such collections aggregated \$2,030,875 in 1939 and \$2,539,162 in the previous year, the latter total being the largest in customs history. See NARCOTICS CONTROL.

BASIL HARRIS.

CYCLING. See SPORTS.

CYCLOTRON. See PHYSICS.

CYPRUS, sī'prūs. A British crown colony in the eastern Mediterranean. Area, 3584 square miles; population (1938 estimate), 374,654 as compared with 347,959 (1931 census). Most of the inhabitants profess the Orthodox-Greek Christian faith and belong to the Autocephalous Church of Cyprus. Mohammedans comprise about one-fifth of the population. During 1938 there were 11,704 births (31.2 per 1000), 5445 deaths (14.5 per 1000), and 3121 marriages (8.3 per 1000). Chief towns: Nicosia (capital), 23,677 inhabitants (1931 census); Limassol, 15,349; Larnaca, 11,872; Famagusta and Varosha, 9979; Ktima and Paphos, 4517; Kyrenia, 2137. During the school year 1937-38 there were 708 govern-

ment elementary schools with a total of 45,183 pupils enrolled; secondary education was given in about 34 schools.

Production and Trade. The main agricultural products (1938 production figures in parentheses) were wheat (54,900 metric tons), barley (41,400 metric tons), carobs (40,987 tons), cotton (1352.5 tons), olives (8282 tons), olive oil (1155 tons), tobacco (15.7 tons), potatoes (22,510 tons), onions (3047 tons), grapes (63,750 tons), and citrus fruits (403,147 cases of oranges and 53,833 cases of lemons exported during 1938). Livestock in the colony (1938): 586,377 (excluding lambs and kids). Sponge fishing is a minor occupation. The output of timber from the forests totaled 903,793 cu. ft. for 1938. Cupreous pyrites (762,482 tons in 1938), asbestos, gold, chrome iron ore, gypsum, and terra umbra were the chief minerals. In 1938 the system of roads extended 2557 miles. During 1938 (exclusive of specie), imports were valued at £2,246,435 (cotton manufactures, machinery, wheat flour, timber, woollen goods, and iron and steel manufactures were the chief items); exports, £2,478,256 (minerals accounted for £1,495,000).

Government. For the year ended Dec. 31, 1938, revenue (exclusive of grant-in-aid, £92,800) totaled £1,023,230; expenditure (exclusive of £92,800, the Cyprus share of the Turkish Debt charge), £908,024; public debt, £822,300. As a result of the political disturbances of 1931 (see NEW INTERNATIONAL YEAR BOOK for 1931; p. 250), the legislative council was abolished by Letters Patent of Nov. 12, 1931, and the governor was granted the power to legislate. The executive council (4 official members with 2 unofficial members appointed by the governor) was retained. During 1933 an advisory council was established. It now consists of 4 official members and 10 non-official members appointed by the governor. The advisory council, which meets in Nicosia under the chairmanship of the governor, has no legislative power but is consulted by the government on legislative and other measures. Governor and Commander-in-Chief, W. D. Battershill who succeeded Sir H. R. Palmer during August of 1939.

History. It was announced in the *Crown Colonist* (London) for July, 1939, that "a petition signed by thousands of people from all districts of the island, expressing dissatisfaction at present conditions and demanding a representative form of government, has been received by the government."

The Cyprus press was forbidden to publish or reprint from the English papers anything relating to the political situation in Cyprus. On July 5 newspapers were allowed for the first time for a month to reprint extracts from the United Kingdom press. The British Colonial Secretary, Malcolm MacDonald, said he "was satisfied that the great majority of the people of Cyprus were not discontented under the existing administration." He asked the new governor to review the situation. Control over foreign exchange was imposed through regulations made by the governor under the Emergency Powers (Defense) Act 1939, published Sept. 8, 1939.

CYRENAICA. See LIBYA.

CYTOLOGY. See BOTANY.

CZECHO-SLOVAKIA, čech'slō-vā'k'i-ā. A former Central European republic (capital, Prague), partitioned among Germany, Poland, and Hungary in 1938 and 1939, with the exception of part of Slovakia which became a nominally in-

dependent republic under German protection, with the capital at Bratislava.

Area and Population. On Jan. 1, 1938, the area of Czecho-Slovakia was 54,244 square miles and the estimated population 15,263,400 (14,729,536 at the 1930 census). Under the Munich Accord of Sept. 29, 1938, 11,071 square miles with 3,653,292 inhabitants were ceded to Germany. On Nov. 1, 1938, 419 square miles with a population of 241,698 were ceded to Poland. On Nov. 2, 1938, Hungary was awarded 4566 square miles with 1,027,450 inhabitants. These cessions left Czecho-Slovakia on Jan. 1, 1939, with an area of 38,180 square miles and a population (calculated on the 1930 census basis) of 9,807,096, divided by provinces as follows: Bohemia, 12,525 square miles, 4,472,353 inhabitants; Moravia, 6533 and 2,332,522; Slovakia, 14,848 and 2,450,096; Ruthenia (Carpatho-Ukraine), 4283 and 552,124, respectively.

Of the total population on Jan. 1, 1939, 8,527,154 were Czechs and Slovaks, 512,289 Russians, 377,830 Germans, 126,310 Jews, 100,379 Hungarians, 127,028 aliens and 31,949 others. A census of Dec. 31, 1938 in Slovakia showed 2,773,000 inhabitants. For the territorial changes taking place during 1939, see *History*.

The chief cities in the republic after the territorial changes of 1938, with their estimated populations were: Praha (Prague), 962,200 in 1937; Brno (Brünn), 291,800 in 1937; Moravská Ostrava, 178,099 in 1935; Bratislava (Pressburg), 170,668 in 1935; Plzeň (Pilsen), 124,353 in 1935. Vital statistics for 1938, including an adjustment for the cession of the Sudetenland, were: Living births, 243,564 (17.6 per 1000); deaths, 184,207 (13.5); marriages, 103,977 (7.2).

Education and Religion. Before the partitions, illiterates comprised 3.2 per cent of the adult population; they were chiefly in Slovakia and Ruthenia. The school attendance in 1937-38 was: Elementary, 1,728,950; higher grade schools, 459,975. In 1936-37 there were 154,768 pupils in secondary and technical schools, 40,860 in schools of commerce, 7207 in technical high schools, and 19,356 in four universities. At the 1930 census Roman Catholics numbered 10,831,696; Protestants, 1,129,758; Greek and Armenian Catholics, 585,041; Jews, 356,830.

Production. Agriculture, manufacturing, forestry, and commerce are the principal occupations. Yields of the chief crops in 1938 were (in metric tons): Wheat, 1,788,300; barley, 1,298,000; rye, 1,680,000; oats, 1,270,000; corn, 343,200 (1937); potatoes, 9,829,100; beet sugar (1938-39), 460,900; tobacco, 14,000 (1937); flax, 11,000 (1937). The 1937 wool clip was 1000 metric tons.

Industrial production included: Rayon (1938), 2430 metric tons; wood pulp (1937), 373,000 metric tons; cement (1936), 1,050,000 metric tons; electricity (1937), 4,000,000,000 kilowatt-hours. The 1938 mineral output was (in metric tons): Crude petroleum, 19,000; lignite and brown coal, 12,000,000; anthracite and bituminous coal, 13,800,000; salt, 181,000 (1937); iron ore (metal content), 595,000 (1937); pig iron and ferro-alloys, 1,234,000; steel, 1,761,000; lead (smelter), 4700 (1937); zinc (smelter), 7200 (1937); antimony ore (metal content), 1169 (1937). Textiles, shoes, glass, leather goods, and many other articles are manufactured on a large scale.

The national income in 1937 was estimated at 66,700,000,000 Czecho-Slovak crowns (about \$2,300,000,000). Approximately 35 per cent of the

national income was lost as a result of the 1938 territorial cessions.

Foreign Trade. Merchandise imports in 1938 were about 8,388,000,000 crowns (10,981,000,000 in 1937); exports, 9,204,000,000 (11,954,000,000). Germany, the United States, and the United Kingdom were the chief sources of supply and the leading markets.

Finance. The budget estimates of the Central Government for 1939 balanced at 3,191,600,000 crowns. For the autonomous administration in Bohemia and Moravia, the 1939 receipts were estimated at 4,638,000,000 crowns; expenditures, 4,902,000,000 crowns.

The national debt on Jan. 1, 1939, was about 54,000,000,000 crowns. The average exchange value of the crown was \$0.0347 in 1938. Effective Mar. 16, 1939, the German reichsmark was accepted as legal tender in the former provinces of Bohemia, Moravia, and Slovakia, the rate being 1 reichsmark to 10 crowns.

Communications. Railways in 1938 extended about 8650 miles, of which 8262 were state owned or operated; roads of all kinds (1939), 43,718 miles; national airlines, 6540 miles. In 1938 the two Czecho-Slovak airlines carried 61,216 passengers and 1289 tons of mail and freight. There is a heavy freight traffic on the Danube, Vltava (Moldau), and Elbe rivers. See **ROADS AND STREETS**.

Government. The Constitution adopted by the Czecho-Slovak National Assembly late in November, 1938, changed the state from a unitary to a federal republic. Autonomous governments were established for Bohemia and Moravia (capital, Prague), Slovakia (capital, Bratislava), and Ruthenia or Carpatho-Ukraine (capital, Huszt). Each "autonomous component" of the republic was granted a separate Diet, to be elected by universal suffrage of all persons over 21 and a separate Premier named by the President of the republic. The three Diets were to elect representatives to a National Assembly at Prague. (Pending election of these representatives the former Czecho-Slovak Parliament functioned as the National Assembly.) The National Assembly retained control of legislation covering the Constitution, foreign affairs, citizenship, emigration, transport, postal matters, national finance, and general economic affairs. It elected a Federal President with greatly increased powers. The provincial governments controlled all local affairs, including their own police and military forces. Federal President at the beginning of 1939, Dr. Emil Hácha (elected Nov. 30, 1938). Federal Premier, Rudolf Beran (appointed Dec. 1, 1938). Premier and Minister of Interior of Slovakia, Dr. Josef Tiso. Premier of Carpatho-Ukraine, Mgr. Dr. Augustin Volosin. For changes in 1939, see *History*.

HISTORY

Death of the Republic. The forces of disruption unleashed within Czecho-Slovakia by the Munich Accord of Sept. 29, 1938 (see 1938 *YEAR BOOK*, p. 193 f.) were actively undermining the shaken foundations of the republic at the beginning of 1939.

In the Czech provinces of Bohemia and Moravia the German minority and other anti-democratic elements, particularly the Czech Fascist party led by Gen. Radula Gajda, worked to discredit democratic institutions. They reinforced the steady pressure from Berlin designed to complete the

transformation of the Czecho-Slovak state into a political and economic dependency of the Reich. Foreign Minister Chvalkovsky, invited to Berlin on January 21, received Nazi demands for a Czech-German monetary and customs union, drastic reduction of the Czecho-Slovak army under supervision of a German military mission, formal abandonment of the mutual assistance pacts with France and the Soviet Union, and increased privileges for the German minority in Czecho-Slovakia. These demands were renewed a month later. In addition Berlin asked for one-third of the Czecho-Slovak gold reserves, the dismissal of all officials identified with the democratic Beneš regime, and the enforcement of more rigid anti-Jewish measures.

Meanwhile the Reich Government and the German minority in Slovakia and Ruthenia actively supported the separatist agitations in those provinces. The Slovak and Ruthenian leaders, more sympathetic with Berlin and with Nazi ideology than the Czechs, proved pliant instruments of German policy. In Slovakia, where Premier Tiso's Slovak People's party had established a full-fledged authoritarian regime late in 1938, Czech officials were dismissed early in 1939, and anti-Semitic laws were made more rigid. The Tiso Government established closer political and economic relations with Germany and adopted an increasingly independent attitude toward Prague. The Fascist Hlinka Guard, Storm Troops of the Slovak Government, demanded complete separation from the Czecho-Slovak republic. Similar tendencies revealed themselves in Ruthenia, where German agents were busily laying the foundations for a "greater Ukraine" under the protection of the Reich.

Czech Counter-Measures. Despite the weakness of their position after Munich, the Czechs strove desperately during the first months of 1939 to prevent the disintegration of the republic. In this effort they were supported by substantial groups in Slovakia opposed to the Tiso Government. But the coalition of internal and external enemies proved irresistible and in March came the tragic sequel to Munich.

On March 6 President Hacha sought to check the separatist movement in Ruthenia by inducing Premier Volosin to reorganize his government and eliminate the pro-German Deputy Premier, Julian Révay. A Czech, Gen. Lev Prchala, was named Minister of Finance, Railways, and Interior in Ruthenia, and immediately proceeded to curb separatist elements.

At the same time the Prague Government moved to check Slovak separatism by withholding financial assistance from the hard-pressed administration at Bratislava until the latter reaffirmed its loyalty to the republic. When Premier Tiso defied Prague, President Hacha on March 9 dismissed the Tiso Cabinet and declared martial law in Bratislava and other Slovak towns. Czech troops sent into Slovakia disarmed the Hlinka Guard and arrested Tiso and other Slovak separatist leaders. The disorders accompanying these events were continued on March 13 when Czech authorities in Slovakia attempted to prevent the German minority from beflagging their buildings with swastikas in memory of the Reich's World War dead.

Slovakia Proclaims Independence. The refusal of the Czechs to comply with Berlin's demands upon the Prague Government and President Hacha's attempt to resist German domina-

tion of Slovakia and Ruthenia provoked the long-dreaded Nazi intervention. On March 10 Tiso had smuggled out from the monastery in which he was interned a telegram requesting Hitler's assistance. Other fugitive Slovak leaders reached Vienna and the Nazis placed the radio station at their disposal for violent attacks upon the Prague Government. The German press unloosed a barrage of denunciation of Czech "barbarism" against the German minority.

On March 13 Tiso escaped from detention and flew to Berlin in a German plane accompanied by Franz Karmasin, leader of the German minority in Slovakia. After an interview with Hitler, Tiso returned immediately to Bratislava. On March 14 he presented to a secret session of the Slovak Parliament—which had been summoned by President Hacha on Hitler's demand—the German *Fuehrer's* promise of military support against Prague. About half the Slovak deputies were said to have opposed separation from the Czechs. But on Tiso's warning that such opposition involved personal danger, the Parliament declared Slovakia's independence and adopted a constitution that had been drafted by Tiso during his return flight from Berlin. Dr. Tiso became President and Premier of the new Slovak republic. By a treaty signed in Berlin March 23 the Reich undertook "to protect the political independence of the Slovak State and the integrity of its territory." The Slovak Government agreed to permit Germany to occupy and fortify a zone along the Polish frontier. Slovakia also agreed to "organize its own military forces in close collaboration with the German armed force," and to "conduct its policy in close collaboration with the German Government."

Subjugation of Bohemia-Moravia. Meanwhile on March 14 the Reich Government had made demands upon Prague that induced President Hacha and Foreign Minister Chvalkovsky to leave immediately for Berlin. Some sources assert that Hitler demanded their presence in the German capital; others that they went voluntarily to salvage what they could of Czech independence. Even before they arrived in Berlin at 1:10 a.m. on March 15 German troops had crossed the frontier and occupied the Czech cities of Moravská, Ostrava, and Vitkovice.

Hitler presented the Czech President with a demand for immediate dissolution of the republic under the threat of aerial bombardment of Prague. President Hacha yielded after a four-hour interview and, according to a Nazi communiqué, "trustfully laid the fate of the Czech people and country into the hands of the *Fuehrer* of the German Reich." Hitler immediately broadcast a proclamation to the German people declaring that Czecho-Slovakia had ceased to exist, and that due to "brutal excesses" against Germans he had "decided to allow German troops today to march into Bohemia and Moravia" and to "disarm terroristic bands and armed Czech forces supporting them."

German motorized columns were already pouring into the Czech provinces. By 9:15 a.m. of March 15 they entered Prague along with units of the German secret police who immediately began wholesale arrests of Czech nationalist leaders. That afternoon Hitler himself drove in triumph through the Czech capital and hoisted his banner over Hradschin Castle, residence of former Bohemian kings and Czecho-Slovak Presidents. The Czech populace, stunned by the sudden, ruthless blow at their national independence, received the

invaders in sullen, tearful silence. There were no demonstrations or disorders.

Protectorate Established. On March 16 a decree signed by Hitler and several of his Ministers declared Bohemia and Moravia a protectorate belonging "to the territory of the Great Reich." The protectorate was termed "autonomous" but "the sovereign rights appertaining to a protectorate" were to be exercised "in harmony with the political, military and economic needs of the Reich." Moreover the German *Fuehrer* assumed power to decree regulations for individual sections of the protectorate "in so far as the defense of the Reich demands." It was stipulated that the "supreme head of the autonomous administration of the protectorate . . . must enjoy the confidence of the *Fuehrer* and Chancellor" of the Reich.

Over the "autonomous administration" was placed a Reich Protector, with authority to dismiss the government of the protectorate, veto its measures, and promulgate decrees. A currency and customs union was established and the Reich assumed control of the foreign affairs, defense, communications, and police as well as blanket authority to "issue legal regulations in so far as common interests demand." Germans residing in the protectorate were made German nationals subject to the jurisdiction of the Reich and to the anti-Jewish Nuremberg laws. Other inhabitants were declared "subjects of the protectorate." In effect the Czech nation, politically one of the most advanced in Europe, was reduced to a quasi-colonial status.

Foreign Protests. The annexation of Bohemia and Moravia, contravening Hitler's promises to Prime Minister Chamberlain at the Munich Conference, called forth formal protests from the British and French Governments and led to the abandonment of the Chamberlain appeasement policy (see FRANCE, GERMANY, and GREAT BRITAIN under *History*). The United States, the Soviet Union and various smaller states refused to recognize the legality of the German action.

Hungary Takes Ruthenia. Meanwhile Hungary had seized upon Slovakia's defiance of Prague and the subsequent German invasion to annex the province of Ruthenia. On March 14 the Budapest Government demanded that the Czechs withdraw their troops from Ruthenia and arm the Magyar minority. Without waiting for a reply to the ultimatum, Hungarian troops invaded the province, which had followed Slovakia in deciding to declare its independence. The Czech forces under General Prchala surrendered but the resistance of the Ruthenian Fascist *Sitch* guards was broken only after some hard fighting. The incorporation of Ruthenia in Hungary was proclaimed in Budapest March 16. Once in control in Ruthenia, the Hungarian forces pushed westward across the ill-defined Ruthenian-Slovakian frontier on March 24 and drove Slovak troops out of 386 square miles of border territory before a protocol was signed on April 3 that confirmed Hungary's possession of the occupied zone. As in the regions acquired from Slovakia in 1938, the Hungarians immediately undertook to crush the Ukrainian nationalism that had taken hold in Ruthenia and to denationalize both Ruthenians and Slovaks in the newly conquered territory.

Nazi Rule in Bohemia-Moravia. Under the powers assumed with the establishment of the protectorate, the Reich proceeded to stamp out the remnants of Czech democratic institutions and

to exploit to the full Czech military, financial, and economic resources. The Czecho-Slovak Parliament was dissolved by President Hacha on March 21. In its place he appointed an advisory Committee of National Co-ordination composed of 50 relatively unknown men. It was not until April 27 that a cabinet for the protectorate was appointed, headed by Gen. Alois Eliash. The German Penal Code was officially imposed upon the protectorate by order of the Commander-in-Chief of the German Army on March 23. Baron Constantine von Neurath, former German Foreign Minister, arrived in Prague April 5 to assume the post of Reich Protector, and a civilian regime then replaced German military rule. Immediately thereafter began the disbandment of the remnants of the Czecho-Slovak army.

The Germans had already seized all Czech military equipment—sufficient to arm 1,500,000 men—including about 200 tanks and 1400 airplanes. It was valued at \$900,000,000. They took over the famous Skoda and other important armament works, owned by the Czech Government, and the important Czech gold and foreign exchange reserves. Czecho-Slovak Government reserves in the Bank of England totaling £6,000,000 gold were later transferred to the Reich. The properties and wealth of Jews and other fugitives or anti-Nazis were confiscated or transferred to German-controlled companies. It was charged that Nazi officials systematically looted safety-deposit boxes and other sources of treasure and turned the proceeds over to the party's treasury. In a speech delivered in New York on June 2, 1939, former President Beneš charged that the Nazi regime "has robbed and transported to Germany more than 35,000,000,000 crowns (\$1,225,000,000) of Czecho-Slovak property."

Reparation was exacted for the Coburg and other large German-owned landed estates distributed under the Czecho-Slovak land reform laws of the 1920's. Levies were made on the agricultural produce of the protectorate to increase the German food supply. In July German authorities ordered increased exploitation of the Czech forests and the delivery of more than half the timber to the Reich. Early in August title to a considerable part of the forests in Bohemia and Moravia was transferred to the German-controlled Land Reform Compensation Fund. On June 22 the Protector assumed power to control industry and draft Czech labor in case of war or a national emergency.

Economic exploitation was accompanied by increasingly drastic political repression and denationalization. Within five days after the German military occupation, the German secret police (Gestapo) were reported to have arrested 18,000 Czechs and arrests on a similar scale were resumed whenever opposition to German rule appeared to be gaining ground. To add to Czech humiliation, Karl Hermann Frank, a leader in the Sudeten German campaign against the republic in 1938, was named Secretary of State of the protectorate and on May 3 was placed in charge of both Czech and German police in Bohemia-Moravia. Many leading Czech officials were arrested or deprived of their posts, and the Czech police were gradually replaced by Germans.

All efforts of the "autonomous" Czech administration to follow an independent course were effectively discouraged. The Protector vetoed much legislation and delayed action on many other measures. The Germans declined to recognize many

appointments of the Hacha regime, rapidly extended their control over the democratically administered Czech municipalities, and adopted numerous measures to break Czech powers of economic resistance and survival. Thousands of skilled Czech workers were sent to Germany and their places taken by Germans. In towns where attacks upon Germans occurred, collective penalties were levied upon the people of the communities. German control of news sources and the virtual exclusion of foreign tourists and travellers from Bohemia-Moravia cut the Czechs off from all except underground contacts with the outside world.

Czech Resistance. To these German efforts to break the Czech national spirit and economic and political power, the people of Bohemia and Moravia opposed both active and passive resistance. The National Unity party, organized late in 1938, served as an instrument for establishing a Czech national front. The only legal political party in the protectorate, it adopted authoritarian principles in order to organize resistance to Germanism within the limitations imposed by Nazi rule. A membership campaign launched in April met an overwhelming response; over 2,000,000 men, or 97.4 per cent of those eligible, joined in answer to the appeal to demonstrate their Czech nationality. The slogan of the members was "I am and will remain a Czech." A number of small Fascist opposition groups were organized with German encouragement to contest the National Unity party's claim to Czech loyalties, but even these groups faded under appeals to Czech patriotism and anti-Germanism. The opposition Fascist leader, Radula Gajda, led most of his adherents into the National Unity party ranks.

From the beginning the Czechs evolved a collective passive resistance with which the Gestapo found it difficult to deal. There was widespread sabotage in plants and factories taken over by Germans. Farmers withheld and hid portions of their crops. A boycott of Germans and their products was organized. There were great pilgrimages to Czech national monuments and other patriotic shrines. Czech national songs were sung in defiance of a police ban. Religious festivals, church services, and all kinds of public programmes were seized upon for spontaneous demonstrations of national patriotism. Secret broadcasting stations and presses distributed anti-German propaganda and news of outside events. German officials and police encountered a wall of unspoken hostility and non-co-operation. There were a few attacks upon Germans, but these evoked stern measures of repression. The National Unity party formally protested the more drastic German infringements of Czech autonomy.

Beginning in May the Czechs also resorted to more active forms of resistance. Thousands of men fled across the closely guarded Polish border to join the Czech Legion organized by the former Czech commander in Ruthenia, Gen. Lev Prchala. Telephone lines of the German army in the protectorate were frequently cut. The Czech administration stubbornly opposed German demands that it assume responsibility for German-inspired legislation against the Jews or against Czech cultural and economic interests.

On September 20, Czech sources in London reported a wave of disorders in Bohemia and Moravia, accompanied by drastic repression. On October 26 reports of a German military collapse

precipitated riotous anti-German demonstrations in Tabor, Bohemia. Defying the orders of the Reich Protector, great demonstrations occurred in Prague and other Czech cities on October 28, twenty-first anniversary of the Czech declaration of independence. Huge crowds wearing black neck ties and armbands as a sign of national mourning paraded silently and for the most part peacefully through the capital. After nightfall there were clashes between police and Czech nationalists, in which a few persons were killed and some 40 wounded. Hundreds of arrests were made, and it was reported on November 2 that Czech workers had threatened a general strike if the prisoners were not released.

A clash between Czech students and Nazi Elite Guards in Prague on November 15 was followed by the execution of 12 students (some reports placed the total much higher), the arrest of more than 1000 others, the closing of Prague University for three years, and imposition of martial law in five districts. Numerous additional arrests were made in ensuing weeks.

A Berlin decree announced June 27 empowered the Reich Protector to issue decrees with the force of law at any time and to change existing Czech legislation considered contrary to German interests. Extensive preparations were made to deal with a possible Czech uprising or sabotage in time of war. Despite Hitler's guarantee of cultural autonomy, the Czech language and schools suffered from increasing restrictions. On July 11 Herr Frank ordered all the central administrative offices in Prague to use German as the original language in official correspondence, with Czech following in translation. On August 19 it was required that all communications between the Czech administration and the Reich Protector's office must be in German and that all public notices must be bilingual. At the same time a campaign was launched to induce Czechs having one parent or grandparent of German nationality to register as a German in the census of Germans in the protectorate then being taken. Germans were placed in control of the principal factories, banks, and business enterprises.

With the development of the Polish-German crisis beginning late in August, the members of the Czech administration were warned that they would be held personally responsible for acts of rebellion or sabotage. During subsequent months, censored news dispatches from Prague reported arrests of Czech leaders and politicians on charges of high treason and thwarting German plans. After the conquest of Poland (q.v.) hundreds of Jews were sent from Bohemia-Moravia to labor camps or the Jewish reservation in German Poland.

Toward the end of the year the growing food shortage, the diversion of Czech food supplies to Germany proper, and the progressive strangulation of Czech industries all served to intensify the unrest seething throughout Bohemia and Moravia. Czech industries were able to secure only a fraction of the raw materials needed even before the outbreak of the European war. Early in July it was reported that the protectorate's export trade to countries with free exchange was less than half what it had been at the time of the German occupation.

Czech Activities Abroad. Meanwhile Czech leaders who had escaped from the protectorate were organizing a campaign abroad for the restoration of their country's independence. Dr. Eduard

Beneš, the former President, was the guiding spirit of this movement. It received encouragement from the attitude of Britain, France, the Soviet Union, the United States, and other lesser powers, which refused to recognize the legality of Germany's annexation of Bohemia and Moravia.

Dr. Beneš announced at Chicago on April 18 that he was organizing a world-wide movement for liberation of his homeland. In British, French, and American capitals and large cities Czech diplomats and consular agents defied the orders received from Prague to turn over their legations and consulates to German authorities. Effective May 25 the German authorities revoked the diplomatic privileges and extraterritorial rights of foreign diplomatic and consular representatives remaining in Prague, thus forcing their governments to decide on the question of recognition. Some of them, such as France and Great Britain, recognized the annexation *de facto* but not *de jure*.

Previous to the outbreak of the European war, Dr. Beneš set up headquarters in London. On September 8 he declared war on Germany in the name of the Czech people. At the same time preparations were made to organize Czecho-Slovak Legions in France and Britain. By an accord with the French Government signed October 5 Czecho-Slovaks in France were authorized to raise an army of their own to fight under the direction of the Allied Supreme Council. General Prchala and about 1000 other survivors of the Czech Legion in Poland immediately enlisted in this force. The French Government on November 17 formally recognized the Czecho-Slovak National Committee, headed by Dr. Beneš and composed of five Czechs and three Slovaks, as the legal "government in exile." The British Government followed suit on December 21. An order mobilizing all Czech citizens between 18 and 50 years in France and elsewhere was posted December 2.

Events in Slovakia. The course of events in the new Slovak state was in many respects similar to developments in Bohemia and Moravia. There was a steady extension of German control and a progressive deterioration of the economic and financial situation, accompanied by the growth of anti-German sentiment and disillusionment with "independence."

The Slovak Government was in severe financial straits when it broke off relations with Prague, and subsequent months witnessed a rapid worsening of this situation. Slovak industries stagnated for lack of raw materials and export markets and because of the dislocations caused by gearing Slovakia into the Nazi economic empire. Employment of some 60,000 Slovak workers in Germany did little to relieve the situation. There was wide dissatisfaction with Premier Tiso's subservience to Berlin and with the reorganization of the country along Nazi lines. The government took drastic measures against Slovaks favoring continued collaboration with the Czechs. The unruly Hlinka Guard was reorganized early in April and "undesirable elements" charged with crime and racketeering were weeded out. Military conscription was introduced May 4. On May 31 a decree inducted all children from 6 to 19 years of age into the Hlinka Youth organization. Business and industry was brought under state control, with German advisers directing the Slovak officials in nominal charge of economic affairs. Most of the

anti-Jewish legislation in effect in Germany was introduced.

On July 21 the Slovak Parliament adopted a new constitution making Slovakia an authoritarian republic. The Constitution called for a Parliament of 80 Deputies elected for five years, and a National Council of 10 members. The National Council, which included representatives of minorities, exercised wide executive powers through Dr. Tiso, its chairman, acting as Chief of State. It also had authority to legislate by decree without ratification by Parliament. On October 26 Dr. Tiso was elevated to the Presidency and Bela Tuka succeeded him as Premier.

Slovak nationalism came into conflict with the small German and Hungarian minorities in Slovakia as well as with the Czechs. Complaints of the German minority received effective backing from Berlin, particularly after Germany on August 18 took military possession of all of Slovakia "in order to protect it from Polish aggression." A Slovak-German military agreement ratified the same day placed the Slovak army and reserves under German command, and they were drafted to serve with the German army of some 300,000 men concentrated in Slovakia during the ensuing war upon Poland.

The Slovak Government actively supported the German claims upon Poland, although Slovak leaders in Warsaw and London denounced this as the action of a puppet government manipulated from Berlin. Beginning August 14 Slovak officials demanded restoration of the Javorina district taken from Slovakia by Poland in October-November, 1938. Slovak troops participated in the invasion of Poland beginning September 1, although the alliance with Germany was widely unpopular. Ten thousand deserters from the Slovak Army were reported to have been interned in Hungary during August and September, and many others deserted into Poland. The German victory led to the return of 225 square miles of territory with approximately 45,000 inhabitants to Slovakia. On September 28 Premier Tiso sent Chancellor Hitler a telegram of thanks for the "protection" he had afforded Slovakia. But a month later it was reported that mounting anti-German activity in Slovakia had resulted in the arrest of many leading Slovaks.

The Slovak state remained unrecognized by the anti-German powers but the appointment of a Soviet Minister to Bratislava was announced in Moscow December 19.

DAIRYING. The rise in commodity prices, improvement in business, and a higher level of consumption of dairy products toward the end of the year, were reflected in an improved dairy situation in 1939. Although milk production showed some decline during the last part of the pasture season as compared with 1938, consumption of manufactured dairy products was distinctly higher. An important factor in the increased consumption was the distribution of butter for relief. During 1939 the Dairy Products Marketing Association purchased about 12,000,000 lb. of butter, but the butter purchases in 1938 were about 114,000,000 lb. All of this was disposed of late in 1939. A total of only 17,600,000 lb. of butter was held by all government agencies,

including the Dairy Products Marketing Association on December 1.

Milk production per cow was only slightly less than in 1938, but the number of cows on farms was larger. Evidently total milk production was practically equal to the record high for 1938, and in the late fall, milk production was very heavy. The large supplies of feed in the fall and winter of 1939-40 suggested high production for the winter feeding period and pointed toward larger numbers of milk cows for 1940.

Pasture conditions were somewhat less favorable in 1939 than in 1938 and declined rapidly during September with about 12 per cent less milk production. Feed grain production of 95,000,000 tons was less than in 1938. However, an increase to 110,000,000 tons was estimated, including the carry-over for 1939-40. In general, fluid milk consumption was consistently higher than in 1938, and was high in relation to production the first part of the year.

Production in excess of consumption of the principal manufactured products was less than in 1938, in part because of the unusually heavy consumption of fluid milk. In contrast with the reduced production of manufactured products, consumption of butter was high, partly due to large distribution of butter for relief.

Total cold storage holdings of butter on November 1 were 128,000,000 lb., which were 34 per cent less than the heavy stocks a year earlier, due to smaller holdings of only 21,200,000 lb. by government agencies, as compared with 111,700,000 lb. on the corresponding date of 1938. Stocks in the hands of the trade were 106,900,000 lb. on November 1, as contrasted with 103,800,000 lb. a year earlier. Production of the principal manufactured dairy products was less in the late summer than in 1938; while apparent consumption was larger. Although some increase was accounted for in the distribution of butter for relief, there was a marked increase in the butter distributed through regular trade channels, as well as in the apparent consumption of cheese and evaporated milk. Stocks of all manufactured dairy products in cold storage were well below those of 1938. Stocks of American cheese in storage on December 1 were 19 per cent less than a year earlier and the lowest since 1932. The decline in butter, cheese, and evaporated milk in storage after allowing for seasonal changes to just about average was an important factor in strengthening the price of dairy products.

Retail prices were higher, an indication of the larger consumer expenditures for butter, particularly during the last part of the year. A marked reduction in manufacturers' stocks of evaporated milk in the fall indicated considerable forward buying. The price of cows in relation to hay and grain prices was the highest in more than 30 years of record.

Smaller exports of condensed and dried milk were offset by increased exports of butter and cheese. Cheese imports were also larger. Excesses of imports of butter over exports experienced in 1938 were changed to an excess of exports. With the outbreak of war, exports of evaporated milk were increased to Great Britain and other belligerent countries. More than 26,000,000 lb. of evaporated milk and 6,000,000 lb. of dried milk were exported during the year.

Important developments of the year in the fluid milk end of the dairy industry were the decisions the U.S. Supreme Court rendered on June 5,

upholding the constitutionality of the Agricultural Marketing Act of 1937 and the validity of the Federal Milk Control plans in the New York and Boston marketing areas. Important points contested in the New York and Boston milk cases were the right of the Federal government to fix minimum prices to producers of milk moving in interstate commerce and the right of the Federal government to establish a program including the principle of equalization.

Research. The U.S. Bureau of Dairy Industry and the State Agricultural Colleges and Experiment Stations were engaged in scientific research programs with the objective of greater efficiency and economy in milk and butterfat production, improvement in the sanitary and nutritive quality of milk and the various products manufactured from it, and the discovery of additional uses for milk products. These studies made evident the proportion of dairy cattle that prove unprofitable, and showed the economy of culling the herds. Through the application of genetic principles, to cattle breeding, a steady rise in the average milk production of the herds followed. There was a diminishing percentage of low and non-profitable animals in the herds.

In addition, better feeding practices were developed and studies made of the utilization of home-grown feeds, improvement of pastures, better curing of hay, and wider use of the silo to preserve perishable feeds. These studies have emphasized a need for adequate feeds if the health and reproductive ability of the cow are to be maintained. Experiments with small laboratory animals were frequently needed to show the role of minerals and vitamins in the rations, and their effect on the nutritive properties of the dairy products.

In studies of additional uses of the dairy products, methods were found in the U.S. Bureau of Dairy Industry for the use of whey in candy, soups, and bakery products. By a new process, casein may be separated from skim milk and used as an adhesive or may be used as lactic acid, or converted into a rubber-like resin with wide industrial uses.

In studies at the National Institute for Research in Dairying, in Reading, England, attempts were made to develop tests that would differentiate milk from cows with subclinical cases of mastitis from normal milk. In these tests, casein number ranked first in indicating mastitis milk, followed in order by chloride content, amount and character of the centrifuge deposit, solids not fat content, bromo-cresol purple reaction, bromo-thymol blue reaction, presence of clots, and catalase content. Within certain limits, the phosphatase test was found applicable as a test of the efficiency of pasteurizing ice-cream mixes. However, it was found necessary to establish standard phenol values for complete pasteurization at various temperatures. Coloring and flavoring materials also affected the accuracy of the test.

The Massachusetts Agricultural Experiment Station investigated the effect of feeding a cod-liver-oil supplement to dairy heifers on growth and reproduction. Although the results were not entirely conclusive, the addition of concentrate to a ration was recommended as an insurance against trouble due to a deficiency of this vitamin, particularly when the roughage was of poor quality.

The Florida Agricultural Experiment Station

found much similarity between the symptoms exhibited by calves on cottonseed-meal rations and by calves on rations deficient in carotene.

In a series of experiments the New Jersey Agricultural Experiment Station found that through inbreeding and the practice of rigid selection, the percentage of fat could be increased in the milk produced by Holstein-Friesian cows. Deleterious effects on the size and growth records of the animals produced must be guarded against to prevent a possible unfavorable weakening of the herd as a result of promiscuous inbreeding.

Bibliography. A few selected references to works of special importance appearing during the year are the following: *Inbreeding and Outbreeding Holstein-Friesian Cattle in an Attempt to Establish Genetic Factors for High Milk Production and High Fat Test*, J. DAMAN. See PORTUGUESE INDIA.

DAMS. The year has been a most active one in dam construction, with the majority of the work, as has been the case in recent years, of Federal origin and in the hands of either the U.S. Bureau of Reclamation or the U.S. Engineer Corps of the Army. A Reclamation Bill totaling over 60 million dollars was signed by the President in May and thus continued at a high scale of activity a bureau that, ten years ago, seemed to have exhausted its resources and opportunities for new constructions. Two great works of this Bureau top the list of outstanding dam constructions of the year.

At Grand Coulee, on the upper Columbia River, work went rapidly forward on the construction of this tremendous undertaking. Plans and plant were described in the YEAR BOOK for 1938. The concreting plant for this work is one of the most gigantic temporary manufacturing plants ever built and has set new records during the year. In May a record of 20,684 cu. yd. of concrete was placed in one 24-hour period. Later in the year another record was made when almost 400,000 cu. yd. was placed in one month. Winter conditions may, of course, much reduce and then probably suspend concreting until spring, but various methods of cold weather placing have been in use.

The main features of the giant Shasta Dam were noted in the 1938 YEAR BOOK. Located high up the Sacramento River, just below the point where the Pit River joins this stream, the Shasta dam is one of those great structures which has as its only rivals the record breaking Boulder and Grand Coulee constructions.

While there was active navigation on the Sacramento River in the early days and boats of 13 ft. draft plied between San Francisco and Sacra-

mento, as a result of the accumulation of the debris of hydraulic mining on the tributaries of this river and of exceptional floods, the channel became badly blocked. Work has been under way for some years under the California Debris Commission (organized 1893) and a 10 ft. channel has been secured below Sacramento by using wing dams and dredging. The difficult flood-channel problem at Sacramento has also been under development. The Shasta dam is expected to do much in reducing flood peaks and, through release of stored water during low river flow, in aiding the canalization of the river up to Colusa (6 ft.) and Chico Landing (5 ft. channel depth). It is expected that the products of the valley—rice, barley, fruits—would justify a new development of navigation for trans-shipment at the San Francisco waterfront. The Shasta dam is thus part of a comprehensive plan of uncertain but promising economic value and importance.

The plant which is being constructed for this great work is unusual in design and unique in size. A belt-conveyor almost 10 miles long, the longest in the world, is being built to convey the aggregate (inert materials in concrete) at the rate of 100 tons an hour, to the dam site. A radial system of cableways, centering in a huge steel tower 460 ft. high (about the same height as the towers of the San Francisco-Oakland suspension bridges) will reach all parts of the structure. It is expected that concreting operations will begin by March, 1940.

It is also interesting to note that the railroad relocation problem involved in this undertaking includes the construction of a 5-million-dollar bridge over one arm of the reservoir. This will be a combined railroad and highway structure of the cantilever truss type with a center span of 630 ft. and requires the highest piers of any bridge in the world. Two of these will be over 350 ft. high. A tunnel around the dam site has been completed and will be used by the railroad, pending completion of the relocated line and, later, as an outlet for the dam.

Another notable western construction is the Ruby Dam, third step in the development of Seattle's hydro-electric system on the Skagit River. This has been renamed the Ross Dam and has posed great transportation difficulties for the builders. It is located at the head of the Diabolo reservoir (see previous YEAR BOOKS) and men and material have been brought to the isolated and inaccessible site by boats, using this reservoir as a waterway.

Still another interesting project is that of raising the height of the O'Shaughnessy Dam some 85 ft., thus providing an additional storage capacity of about 75 per cent that of the existing reservoir. Part of the Hetch Hetchy water supply for San Francisco, the foundations of this dam were built so as to allow this increase and this dam will thus become among the greatest in the world with a total height of 430 ft.

A similar situation exists at the Marshall Ford Dam on the Colorado River, now nearing completion by the U.S. Bureau of Reclamation for the Lower Colorado River Authority. It is hoped to proceed at once with an increase in height of 78 ft.

The Conchas Dam (see YEAR BOOK, 1938), is also nearing completion by the U.S. Engineers on the South Canadian River in New Mexico, 180 miles east of Santa Fe. Similarly the Bartlett Dam of the U.S. Bureau of Reclamation Salt River project on the Verdi River in Arizona, is expected to be completed by mid-summer, 1940.

It will be the highest multiple arch dam in the world, 270 ft.

In the central South the work of the TVA goes rapidly forward. The Chickamauga dam on the Tennessee River above Chattanooga is in the last stage of construction. An interesting rock-crushing operation is under way for the Hiwassee Dam, and the greatest of the TVA dams, Gilbertsville, is also under construction. Located on the Tennessee, 23 miles above its junction with the Ohio, Gilbertsville will cost about 90 million dollars, the cost being about equally divided between land, dam, and railroad and highway relocations.

Earth Dams. The remarkable development in earth dam construction continued during the year. Engineers were, of course, much interested in the official report on the great (5 million cu. yd.) slide at the Fort Peck Dam. The failure was attributed previously to a displacement of the foundations under the superimposed load. Nevertheless the loss of embankment was made good, and, on November 5, the hydraulic dredges practically completed their part in this construction and were stopped. The upper 25 ft. of the fill will be placed by the rolled fill method, taking the material from the downstream slope.

Another dam failure of last year—the Marshall Creek dam near Kansas City—also attributed to poor foundation conditions, is being reconstructed by WPA forces under Army engineers. This time the clay bottom will be stripped to rock, lower slopes will be used, and increased spillway will be provided.

The Nebraska Public Power and Irrigation operations have raised much discussion in the power field and they have also had to meet difficult construction problems. The Kingsley Dam of the Central District is one of the giants of recent earth dam constructions. On the North Platte near Ogallala, Neb., this dam requires 26 million cu. yd. of fill. The spillway and outlet works are practically completed and work is under way on placing the fill, two 30-in. hydraulic dredges being employed. One contract calls for a million pre-cast rip-rap blocks for protecting the upper face of the structure.

The Sardis Dam, on a tributary of the Yazoo River (which enters the Mississippi near Vicksburg), is interesting both because it is the first retention reservoir construction for flood control on the lower Mississippi and because of its size. An embankment $2\frac{3}{4}$ miles long is required and almost 18 million cu. yd. of fill will be necessary. This places it next in size to Fort Peck and Kingsley.

An unusual type of dam to use in a comparatively narrow canyon, the Mad Mountain Dam on the White River near Enumclaw, 47 miles southeast of Seattle, will also be of record-breaking height, 420 ft. It is under construction by the U.S. Engineers and is to be rolled earth fill. On the other hand, the Hansen Dam, on Tujunga Wash near Los Angeles, will not be of record height but will involve the largest fill—13 million cu. yd.—ever placed by the dry, rolled earth fill method.

Plans have just been approved, however, for the construction of a rolled earth dam on the Red River near Denison, Tex., which will require $15\frac{1}{2}$ million yards of rolled earth fill. This work will thus exceed even the Hansen project. The height is to be 165 ft. and the work will be under the U.S. Engineers Corps.

Buttress Dams. In addition to the Bartlett Dam which has already been noted as a record

structure, two other dams of this type are of great interest.

The Pensacola Dam, for power and flood control on the Grand River, at Pensacola, Okla., is also a great multiple arch structure. It is being built by the U.S. Engineers for the Grand River Dam authority at one of three sites which have been under study. Fifty-one arches of 60-ft. span between hollow buttresses of a maximum of 152 ft. in height and with an 860-ft. gravity-section spillway are being used. The work is almost three quarters completed.

Twenty-five miles north of Mineral Wells, Tex., another remarkable structure is under construction. This dam is a slab and buttress type with massive solid buttresses from 9 to 10 ft. thick. Intended for flood control, water conservation and power, the Possum Kingdom Dam, as it is called, is one of a possible 13 dams to be built on the Brazos River and its tributaries. It is 2740 ft. long and will have a maximum height of 189½ ft. Construction is well advanced.

To one who follows dam construction it thus seems that every possible site for a dam is being explored and that any structure which can show any possible reason for construction is being exploited in this amazing period of dam construction.

DANISH LITERATURE. See SCANDINAVIAN LITERATURE.

DANZIG, dān'tsik, FREE CITY OF. A territory including the Baltic port of Danzig at the mouth of the Vistula River, which was detached from Germany and constituted a Free City under the protection of the League of Nations by Article 102 of the Treaty of Versailles. It was restored to Germany on Sept. 1, 1939.

Area and Population. Area, 754 square miles; estimated population in 1938, 407,000, including 258,000 in the city of Danzig. The people were German-speaking, with the exception of a Polish minority of about 10,000. Living births in 1937 numbered 8807; deaths, 4732; marriages, 3456. The school enrollment in May, 1938, was: Elementary, 50,795; middle, 3766; high school, 5207; the Technical University, 1244.

Trade and Communications. Danzig formerly handled practically all of the sea-borne trade of Poland and adjoining regions of North Central Europe. Beginning in the 1920's, it was forced to share this trade with the newly constructed Polish port at nearby Gdynia. During 1938 6601 vessels of 4,768,000 net registered tons and a cargo of 1,564,000 tons entered at Danzig; the tonnage of goods exported by sea was 5,563,200. The sea-borne trade of Poland passing through Danzig in 1938 was 5,972,000 tons valued at 376,000,000 zlotys; through Gdynia, 8,712,000 tons valued at 1,183,000,000 zlotys. Four main railway lines connected Danzig with Germany and three main lines with Poland. Airlines linked the port with Warsaw, Berlin, and Königsberg and there were shipping services to the principal ports of the world.

Finance and Government. In ordinary budget estimates of the Free City for the fiscal year ending Mar. 31, 1940, receipts and expenditures balanced at 126,880,000 gulden (119,002,000 gulden in 1938-39). The foreign consolidated debt on Mar. 31, 1938, totaled 37,000,000 gulden. The value of

the gulden during January-September, 1939, was about \$0.1881. Transfer of service on all foreign loans of the Free City was suspended in July, 1939.

Government. Previous to annexation by Germany, the Free City was an independent state except for the following limitations imposed by the Treaty of Versailles and a supplementary Danzig-Polish treaty: (1) Danzig was within the Polish Customs frontier; (2) the harbor of Danzig was administered by a board composed of an equal number of Poles and Danzigers with a neutral president, usually appointed by the League of Nations; (3) foreign relations were conducted by Poland in consultation with representatives of the Free City, and (4) the railways connecting Danzig and Poland were part of the Polish State Railways.

Under the Constitution a Diet of 72 members, elected by universal secret suffrage for four years, in turn chose a Senate of 12 members. The Senate was the highest state authority and its President was general executive head of the Free City. The League of Nations and Poland were represented by High Commissioners. The National Socialist party of Danzig gained control of the government beginning in 1934 and in the ensuing years eliminated all opposition parties except the Polish minority group and established an authoritarian regime based on Nazi principles and working in close collaboration with the Berlin Government. President of the Senate at the beginning of 1939, Arthur Greiser. High Commissioner of the League of Nations, Dr. Karl Burckhardt (Swiss). For changes in 1939, see *History*.

HISTORY

The Nazi demand for the restoration of the Free City of Danzig to the Reich was one of the immediate issues that led to the German-Polish conflict of September, 1939, and involved Britain and France in war with Germany (see FRANCE, GERMANY, GREAT BRITAIN, and POLAND under *History*); EUROPEAN WAR.

German Dissensions. The Germans of Danzig were not a unit in their desire to return to Germany. A substantial group of former Social Democrats and other anti-Nazis continued to protest Nazi aims and principles despite repeated arrests of their leaders and other forms of repression. On April 20, the 50th anniversary of Chancellor Hitler's birthday, the Nazi party leader in Danzig, Albert Foerster, and representatives of the Danzig government presented to the Chancellor in Berlin a deed making him an honorary citizen of Danzig. The same day Danzig was flooded with leaflets distributed by anti-Nazi Germans ridiculing Hitler and National Socialism, and there were clashes between Nazi and anti-Nazi groups. Again on July 20 the Danzig police arrested more than 20 former Social Democrats and other Marxists charged with planning a campaign of sabotage to prevent reincorporation of Danzig in the Reich. Additional arrests of anti-Nazis preceded the outbreak of the German-Polish war.

Conflict with Polish Minority. The efforts of Danzig Nazis to curtail Polish treaty rights in the Free City and eliminate the Polish minority had caused much bitterness during 1938 (see 1938 YEAR BOOK, p. 206). In January of 1939 the task of eliminating the Jewish community in Danzig was virtually completed with the deportation of 1000 Jews on a sealed train. Nazi pressure upon

the Polish minority was then intensified. Several weeks of clashes between Polish and German students in the Technical College culminated in the forcible expulsion of the Polish students by uniformed Nazis on February 24.

When Poland in March rejected Hitler's proposal for immediate return of the Free City to Germany, both Germans and Poles began to prepare for a resort to arms. With Danzig demilitarized and strong Polish forces concentrated near the Free City borders, the Danzigers were in no position to offer effective armed resistance to a Polish invasion. Consequently while proclaiming their determination to rejoin the Reich, they postponed reunion at Hitler's orders until the latter had completed his military and diplomatic preparations for the destruction of Poland.

The months from March to September were occupied in secretly arming and preparing for the defense of the city while exerting every sort of pressure short of open warfare to curb Poland's treaty rights and influence in the territory. There were repeated assaults upon Polish citizens, restriction of their political, social, and economic activities, and other forms of harassment. The Poles retaliated by diverting more of their trade to Gdynia and by other forms of economic pressure. Polish participation in the Danzig harbor administration, the customs and the schools were sources of chronic controversy.

In June the Nazis began to display a more defiant attitude toward the Poles. Polish officials in Danzig were boycotted. Some Polish customs inspectors were beaten up and arrested. The demilitarization provisions of the Danzig Statute were openly violated when 8000 young Nazis paraded with arms smuggled in from Germany. A Danzig "Free Corps" was organized as a substitute for the regular army. In the middle of July some 2000 German Storm Troopers, known for the rôle they played in the Sudetenland agitation against Czechoslovakia in 1938, arrived in Danzig. At the same time 4000 extra "policemen" were brought in from Germany.

Reunion Proclaimed. In August signs multiplied that Berlin had authorized the Danzig Nazis to prepare for early union with the Reich. There were numerous demonstrations, addressed by leading German officials. The Danzig Government issued a regulation forbidding Polish customs officials to exercise their functions in the Free City. On August 22 Dr. Hans Frank, German Justice Commissioner and Cabinet Minister, told the German Lawyers Association meeting in Danzig that the treaty provisions under which the Free City was established were null and void. On August 30 all communications between the Free City and Poland were cut and on September 1, coincident with the German invasion of Poland, Herr Foerster issued a decree proclaiming the annexation of the Free City to the Reich and appointing himself sole administrator of the territory. The Danzig Constitution was immediately suspended.

Immediately after this proclamation was issued, Foerster telegraphed Chancellor Hitler begging him "in the name of Danzig and its population to consent to this basic state law and to carry out the reunion with the German Reich through Federal law." Hitler telegraphed an immediate reply thanking Foerster and the Danzigers for their loyalty, stating that "the law for reunion is ratified forthwith," and appointing Foerster head of the civil administration of Danzig.

The War in Danzig. According to the Ger-

man general staff, the Polish military plan called for immediate occupation of Danzig in the event of war with the Reich. German preparations to prevent this were effective and Danzig escaped the ravages of warfare. However a small Polish force in Westerplatte Fortress in Danzig Harbor, against which the first shot of the Polish-German war was fired, held out against German land and air attacks and bombardment from the German naval vessel *Schleswig-Holstein* until September 7.

After the defeat of the main Polish armies, Hitler made his triumphal entry into Danzig on September 19. He was thunderously acclaimed as "liberator" of the territory.

DARTMOUTH COLLEGE. A nonsectarian institution for the higher education of men in Hanover, N. H., founded in 1769. The 1939 autumn session had an enrollment of 2431 students. There were 264 members of the faculty. The endowment amounted to \$17,612,715, while the total income for the year was \$1,901,602. The Fisher Ames Baker Memorial Library contained 497,009 volumes. President, Ernest Martin Hopkins, LL.D.

DAUGHTERS OF THE AMERICAN REVOLUTION, a patriotic society of women, organized in Washington, D. C., in 1890. In substance its objects are as follows:

(1) Historical, the perpetuation of the memory and spirit of the men and women who achieved American Independence through protection of historic spots, encouragement of historical research regarding the American Revolution, preservation of records and celebration of patriotic anniversaries.

(2) Educational, the promotion of "institutions for the general diffusion of knowledge," thus affording to young and old such advantages as shall develop in them the largest capacity for performing the duties of American citizens.

(3) Patriotic, to cherish, maintain, and extend the institutions of American freedom, to foster true patriotism and love of country, and to aid in securing for mankind all the blessings of liberty.

Eligibility for membership depends upon direct descent from a man or woman who, with unfailing loyalty, aided in achieving American Independence.

Active membership exceeds 143,000 in 2500 chapters in this country and abroad. President General, Mrs. Henry M. Robert, Jr. Headquarters, Memorial Continental Hall, Washington, D. C.

DAVIES, JOHN VIVOND. An American engineer, died in Flushing, New York, Oct. 4, 1939. Born in Swansea, South Wales, Oct. 13, 1862, he studied at Wesleyan College, Taunton, and the University of London. He was associated with Parfitt & Jenkins during 1880-88 and then came to the United States, where he became associated with Charles M. Jacobs on various machinery jobs and, in 1893, the digging of the first tunnel under the East River, the Ravenswood Gas Tunnel for the East River Gas Co. In 1894 he entered into partnership with Jacobs under the name of Jacobs & Davies, Inc., consulting engineers. In 1917, Mr. Davies succeeded to the presidency of the company.

During his long association with the firm, Mr. Davies was chief engineer in charge of the design and construction of the West Virginia Short Line Railroad and the Kanawha & Pocahontas Railroad in West Virginia (1898-1900), chief engineer of the Atlantic Avenue improvement for the Long Island Railroad (1901-07), construction engineer for 26 aqueduct tunnels in Mexico (1912-13), engineer in charge of the

Astoria Tunnel of the Consolidated Gas Co. of New York (1910-16), engineer in charge of the construction of the Hales Bar Dam across the Tennessee River at Chattanooga (1910-13), and engineer in charge of construction intake and discharge tunnels of the New York Edison Co. (1918-19). From about 1900 he was associated with the predecessors of the Hudson & Manhattan Railroad Co., and designed and built the four tunnels under the Hudson River and New York, connecting Jersey City and Hoboken with New York, for that railroad. He was its chief engineer for many years, and in 1913 was elected a vice president of the Railroad.

One of the leading men in his profession, Mr. Davies served as a member of the board of consulting engineers of the New York State Bridge and Tunnel Commission and of the New Jersey Interstate Bridge and Tunnel Commission. He was president of the United Engineering Society during 1920-23 and received the Telford gold medal (1914) of the Institute of Civil Engineers and the Norman Gold Medal (1913), the Thomas Fitch Rowland Prize (1917), and the Fowler Professorial Award (1930) of the American Society of Civil Engineers.

DEBTS. See PUBLIC FINANCE for United States debt; articles on foreign countries under *Finance*; REPARATIONS AND WAR DEBTS.

DEFENSE. See CONGRESS, UNITED STATES: MILITARY PROGRESS; NAVAL PROGRESS.

DELAWARE. *Area and Population.* Area (1930, later revised to include a gain of 64 square miles of water through a revision of the New Jersey boundary), 2434 square miles; included water, 469 square miles. Population: Apr. 1, 1930 (census), 238,380; July 1, 1937 (Federal estimate), 261,000; 1920 (census), 223,003. Wilmington had (1930) 106,597 inhabitants; Dover, the capital, 4800.

Agriculture. Farmers in Delaware harvested, in 1939, 361,000 acres of the principal crops; about four-fifths of this total was in corn, wheat, and tame hay. Corn, on 144,000 acres, made 4,176,000 bu. (estimated value on the farm, \$2,589,000); wheat, on 72,000 acres, 1,296,000 bu. (\$1,076,000); tame hay, on 72,000 acres, 91,000 tons (\$1,019,000). Apples gathered for market yielded 1,750,000 bu. (\$1,225,000); peaches, 422,000 bu. (\$338,000). Sweet potatoes, on 5000 acres, gave 675,000 bu. (\$506,000).

Manufacturing. In Delaware were 359 manufacturing establishments in 1937 (in 1935, 339), employing 21,052 wage-earners (in 1935, 16,532), who received \$22,991,808 in wages (in 1935, \$15,259,295). The manufactured products amounted to \$124,383,887 (for 1935, \$83,015,313). New Castle County provided about nine-tenths of the manufacturing production, and Wilmington, chief city of that county and of the State, manufactured in 1937 goods to the value of \$69,740,028.

Education. For the academic year 1938-39 Delaware's inhabitants of school age were estimated to number 52,300. The year's enrollments of all pupils in the public schools totaled 44,538; this included 409 in kindergartens, 20,977 in the elementary group, and 16,538 in high schools. The year's expenditure for public-school education amounted to \$4,473,909. The public schools' teachers, 1682 in all, received \$1544 a year in average salary.

Legislation. The regular biennial session of

the General Assembly, convening in January, held Republican majorities in both houses, sufficiently strong to overthrow if desirable, vetoes by the Democratic Governor. There were enacted laws for an income tax, to include Federal salaries in its application; a measure making the "blue hen's chicken" (nickname of the Delaware Revolutionary soldier) the State's official bird; and a bill allowing Wilmington to vote whether to permit the showing of commercial moving pictures on Sundays; but this one last bill was vetoed. Increases of salary were granted to teachers in the public schools, on the basis of length and fidelity of service.

Political and Other Events. The City of Wilmington celebrated, with ceremonies started by a parade on November 16, the 200th anniversary of the granting of Wilmington's royal charter as a borough by George II of England in 1739. A State commission, created by the Legislature, made a study of obsolete or unenforced statutes, particularly the "blue" laws prohibiting activities of hotels, street cars, filling stations, and many other conveniences on Sundays; Attorney-General Morford urged that this commission propose the summoning of a special session of the Legislature to repeal such laws. The Federal and other payments for public assistance of all sorts to the indigents outside of institutions in Delaware ran, for June, to somewhat less than \$1,000,000; they were the smallest for any State, and among the least in proportion to population.

Officers. Delaware's chief officers, serving in 1939, were: Governor, Richard C. McMullen (Dem.); Lieutenant-Governor, Edward W. Cooch; Secretary of State, Josiah Marvel, Jr.; Attorney-General, James R. Morford; Treasurer, Fagan H. Simonton; Auditor, Benjamin I. Shaw; Superintendent of Public Instruction, Dr. H. V. Holloway.

DELAWARE, UNIVERSITY OF. An institution of higher learning in Newark, Del., founded as an Academy in 1743 and granted a degree-conferring charter in 1833. It contains two co-ordinate colleges—one for men and one for women. The enrollment in 1939 was 976, of whom 601 were men and 375 were women. The enrollment in the 1939 summer session was 454. The faculty numbered 140 members. Appropriations from the State and Federal governments, plus income from other sources, amounted to approximately \$748,800 and invested endowment funds to \$605,536. The library contained approximately 79,200 volumes. President, Walter Hulihan, Ph.D., D.C.L., LL.D.

DELINQUENCY. See CHILDREN'S BUREAU; PRISONS, PAROLE, AND CRIME CONTROL; PSYCHOLOGY.

DEMOCRACY. Social and political change in many countries invited in 1939 renewed attention to the doctrine of democracy. In the United States several notable organizations carried the word democracy in their titles and were active in the role of champions of this way of government. The most ambitious of these was the Congress on Education for Democracy, which though merely a meeting of American and some other supporters of democracy, took steps toward forming a permanent organization to advance its purpose. This Congress met August 15-17 at Columbia University in New York City; it had

been brought about mainly by the efforts of Dean William F. Russell of Teachers' College and Winthrop W. Aldrich, chairman of the board of the Chase National Bank; among those who addressed it were Nicholas Murray Butler, Earl Baldwin (former British Premier), John M. Ciechanowski (former Polish Ambassador to the United States), and Lord Stamp, who though detained in England spoke by radio; Edouard Herriot, President of the French Chamber of Deputies, who had been invited, sent a message. The effect of the session was to unite the bulk of the 383 delegates, for the most part leaders in a diversity of American educational, religious, industrial, and occupational groups, in the view that the future of democracy depended on better-planned education in democracy's base and requirements. Dean Russell in a closing address stated a plan to continue the work of the congress by means of a permanent body that would keep contact with helping organizations, would provide material for teaching democracy, and would carry on research on behalf of such teaching. While no formal classification of the type of democracy to be supported was adopted by the congress, the speeches as a whole indicated prevailing intention to promote representative government, extensive rights and liberty for the individual, and reliance on the performance of enlightened individual duty to the public cause rather than on an extension of authority.

Distinct from the congress, the American Committee for Democracy and Intellectual Freedom worked in some respects in the same field. This body issued, April 23, a declaration against activities that it opposed; the signers numbered 2391, of whom many held directive posts in universities or in journalism. The declaration condemned "discrimination" in schools, on account of poverty, sex, race or religion; demanded for teachers "intellectual freedom" and training in their responsibilities; held necessary full moral "and material" aid to students; called for protection of liberty of speech, press, assembly, "and teaching." And laid down the requirement that schools, press, and radio "must present the facts" as to history, the present world, race, and culture. Prof. Franz Boas, chairman of this committee, sent out, July 16, a statement controverting alleged misuse of the "concepts of race and of Aryanism" in current textbooks, and particularly the presentation of these ideas in ways favorable to "demagogues like Coughlin and Moseley."

The American Youth Congress, an annual gathering of young people's organizations since 1934, met in New York City July 1; it was charged by some of its members with failing to conform with the principles of democracy. It rejected, July 2, this party's motion to amend its "creed" by the insertion of a pledge to oppose communism. Thereupon a number of the groups in the congress withdrew, charging that the congress was partial to communism and therefore was not in accord with its own creed's endorsement of American democracy. The congress then passed a resolution condemning dictatorships, "Communist, Fascist, Nazi, or any other type," but according freedom of discussion to all, Communists, Socialists, and Fascists included.

Outside of the United States one of the proceedings bearing on the doctrine of democracy was the International Congress of American Democracies, which met in Montevideo, Uruguay,

March 20. Despite its name, this was a gathering of representatives not of governments, but of popular occupational or class organizations, commonly leaning to the left; many of the attendance had been driven into exile by the governments of their home lands. The Peruvian government reportedly protested to Uruguay on permitting the gathering, on the ground that Peru would there be represented only by outlawed Apristas; pressure from another quarter also, to forbid the meeting, was supposed to have been exerted. Uruguay allowed the congress to meet but forbade attacks on governments. This curtailed the intended effort to "mobilize opinion against the threat of penetration by totalitarian ideologies." The exiles, moreover, were relatively few: the Uruguayans in the congress numbered more than 300; those from the nine other participating countries, 83; and of the latter, Chile, and the United States, both friendly with their respective delegates, supplied in the order named, 17 and 4. Communists, moreover, were not admitted, save for two from Chile, who came as members of that nation's Popular Front. The delegates from the United States were: Kathryn Lewis, daughter of John L. Lewis and representative of Labor's Non-Partisan League; Luigi Antonini, of the American Labor Party; Marina Lopez, of the Council for Pan-American Democracy; and Jack B. Fahy, of the United Student Peace Movement.

The congress ended on March 24 six days before its appointed close, by reason of the 45 Argentine delegates' withdrawal in protests against Uruguay's prohibiting broadcasts of the proceedings to Argentina, Brazil, and Peru. A succeeding congress was proposed, to meet in Washington in September, 1940. Resolutions were passed for the creation of an inter-American organization "of the masses" to fight Fascism; for democratic faith and solidarity; and a defining democracy. The circumstances surrounding the congress made information too scanty for casting any clear light on possible communistic tendencies in the proceedings.

Compare COMMUNISM; FASCISM; SOCIALISM.

Over 20 British youth organizations were represented at the Youth Conference on Democracy Today and Tomorrow, held in London early in February under the auspices of the Association for Education in Citizenship.

A plea for a federal union of 15 countries classed as democratic (*Union Now* by Clarence K. Streit) aroused widespread discussion during 1939 and was republished in several foreign languages.

DEMOCRACY AND INTELLECTUAL FREEDOM, AMERICAN COMMITTEE FOR. See DEMOCRACY.

DEMOCRATIC PARTY. The chairmanship of the Democratic National Committee remained in the possession of Postmaster-General James A. Farley throughout the year. Himself regarded as a possible candidate for President, Farley had gained the knowledge of the national political keyboard by six years of service in the chairmanship. He continued, however, in apparently thorough accord with President Roosevelt, while the President's avoidance of a declaration for or against a third term of office restricted the Democratic political activities in the Presidential field.

The Young Democratic Clubs of America held a convention in Pittsburgh, August 10-12, pro-

viding the most noteworthy action of the National Democratic organization in the course of the year. The convention received with enthusiasm a message from the President that he would not support as a candidate any conservative nominee for President that the Democratic convention might put up in 1940. The convention did not adopt any resolution in favor of the future candidacy of Mr. Roosevelt but it gave strong approval to his policies. Virginia's Young Democratic clubs, however, voted (August 26) disapproval of a third term for "any man."

Among the States the chief action in the Democratic party in favor of a Presidential aspirant was the Texan Legislature's endorsement, in March, of John N. Garner. In general, other Democratic possibilities postponed activity, awaiting a definite sign whether the President would or would not seek a third term.

The effort of the head of the Democratic party—the President—to drive out the dissidents from political life or from the party fold had failed in the elections of 1938; it was not actively resumed in 1939. None the less it was kept alive by a passage, in a message (April 19) to the Young Republican Clubs celebrating Jefferson's birthday, to the effect that conservative Democrats should conform or leave the party.

There appeared no activity in planning the way to meet the cost of the Democratic National campaign of 1940. The most conspicuous single source of money in 1936 had been the contributions from organizations dominated by John L. Lewis; according to the New York Times's summary (August 11) of such contributions recorded with the Clerk of the House, the United Mine Workers had contributed \$420,000 or more toward organizations campaigning for the New Deal and had lent \$50,000 to the Democratic National Committee.

DE MOLAY, ORDER OF. A nonsectarian secret organization for young men between the ages of 15 and 21, founded in 1919 by Frank S. Land in Kansas City, Mo., and named in honor of Jacques De Molay, the last military grand master of the Knights Templar. The members are pledged to the precepts of love of parents, reverence, patriotism, cleanness, courtesy, fidelity, and comradeship, and to the promotion of the public school system and good citizenship. The Order is governed by a Grand Council of Freemasons, while the Chapters are sponsored by Masonic Bodies or groups of Masons. However, it is not a junior Masonic fraternity, and more than 60 per cent of its members are from non-Masonic families. In November, 1939, the active membership numbered approximately 150,000. The organization has an alumni of more than 900,000 men. The official organ is *International De Molay Cordon* (monthly). Frank S. Land, the founder, is Secretary General; Franklin D. Roosevelt is Honorary Grand Master; Allan M. Wilson, Manchester, N. H., Grand Master; Robert D. Williams, New York, N. Y., Deputy Grand Master. Dr. Stratton D. Brooks is Executive Director of the Secretary General's staff. International headquarters are at 201 East Armour Boulevard, Kansas City, Mo.

DENISON UNIVERSITY. A coeducational Christian college of liberal arts in Granville, O., founded in 1831. The enrollment for the autumn of 1939 was 847. Faculty members numbered 65. The endowment for 1938-39 was \$3,158,785, and the income, \$340,619. The library

contained 130,000 volumes including government documents. A new dormitory for women was opened in September, 1939, and a new dormitory for men was under construction. Gifts to the amount of \$107,320 were received. President, Avery Albert Shaw, A.M., D.D., LL.D.

DENMARK. A kingdom of northwestern Europe, comprising the peninsula of Jutland and two main islands of Zealand and Funen, with about 200 smaller adjacent islands in the Baltic, the Faroe Islands (q.v.), and Greenland (q.v.). The King of Denmark is also King of Iceland (q.v.). Capital, Copenhagen (Köbenhavn). King, Christian X, who succeeded to the throne May 14, 1912.

Area and Population. Area, excluding outlying possessions, 16,576 square miles. Estimated population on June 30, 1939, 3,805,000 (1935 census, 3,706,349). Living births in 1938 numbered 68,476 (18.1 per 1000); deaths, 39,057 (10.3); marriages, 33,624 (8.9). Emigrants in 1937, 9500. Populations of the chief cities were (1935 census): Copenhagen, 843,168; Aarhus, 90,898; Odense, 76,116; Aalborg, 48,132.

National Defense. Military training is compulsory, some 6800 conscripts being called up annually. The army, approximating 14,000 men in normal times, has few modern armaments and only about 65 airplanes. The navy consists of 2 coast defense ironclads, 17 torpedo boats, 3 mine-sweepers, 8 submarines, and about 35 airplanes. Under construction in 1939 were 1 mine-layer, 2 submarines, and 3 mine-sweepers. See *History*.

Education and Religion. There is no illiteracy. The 4498 lower schools had 486,000 pupils on Jan. 1, 1937; secondary, professional, and vocational schools, 64,980; the two universities at Copenhagen and Aarhus, 5600. The 1921 census showed 3,221,843 Protestants, 22,137 Roman Catholics, 5947 Jews.

Production. About 35 per cent of the working population is engaged in agriculture and dairying and 33 per cent in industry. Commerce and fishing are the other principal occupations. The 1938 livestock census showed 2,845,000 swine, 3,183,000 cattle, 564,000 horses, and 27,600,000 hens. Production in 1938 was (in metric tons): Butter, 190,000; milk products, 18,200; margarine, 81,300; cheese, 29,000; pork (1937), 317,100; wheat, 460,900; barley, 1,359,400; rye, 283,600; oats, 1,144,200; potatoes, 1,432,700; beet sugar (1938-39), 171,000. The sea fisheries in 1938 yielded 86,000 metric tons valued at 40,000,000 crowns. The value of industrial production, which was 3,019,700,000 crowns in 1937, declined very slightly in 1938. The 1938 sales turnover of all co-operatives belonging to the Federation of Danish Co-operative Societies totaled 2,201,800,000 crowns.

Foreign Trade. Imports for consumption were 1,640,900,000 crowns in 1938 (1,673,800,000 in 1937); exports of Danish products, 1,550,600,000 (1,568,500,000). The United Kingdom in 1938 took 55.5 per cent of all Danish exports; Germany, 19.6 per cent. See **IMPORTS AND EXPORTS**.

Finance. Closed accounts for the fiscal year ended Mar. 31, 1939, showed receipts of 573,200,000 crowns and expenditures of 553,000,000 crowns in the ordinary budget. The 1939-40 ordinary estimates placed receipts at 535,400,000 crowns, expenditures at 531,200,000, and the surplus at 4,200,000 against actual surpluses of 20,-

200,000 in 1938-39 and 25,500,000 in 1937-38. The outbreak of war in Europe in 1939 caused extraordinary expenditures of about 100,000,000 crowns above the 1939-40 budget estimate. The public debt was 1,255,000,000 crowns on Mar. 31, 1938. The crown (krone) averaged \$0.2183 in 1938, and \$0.2035 in 1939.

Transportation. Denmark has about 3145 miles of railway line (1483 miles state owned); 32,197 miles of highways (1939); and airlines connecting Copenhagen with the chief European centers. Most of the air services were resumed after being temporarily interrupted by the outbreak of war in September, 1939. Danish Airlines carried 42,000 passengers in 1938 (21,000 in 1937). The Danish merchant marine on June 30, 1938, aggregated 1,129,900 gross tons. The earnings of Danish steamers and motorships in 1938 were 279,000,000 crowns (309,000,000 in 1937). The total goods turnover in Danish ports in 1938 was 17,800,000 tons (19,100,000 in 1937).

Government. The Constitution vests executive power in the King, who acts through a cabinet responsible to the Rigsdag (Parliament). Legislative power rests jointly in the King and the Rigsdag. The Rigsdag consists of two chambers, the Folketing (lower chamber) of 149 members elected for four years by proportional representation and the Landsting (upper chamber) of 76 members, of whom 19 are elected by the Landsting itself and the remainder indirectly by voters of over 35 years of age. The term of Landsting members is eight years. Premier in 1939, Th. A. M. Stauning (Social Democrat), heading a coalition government of the Social Democratic and Radical parties, reconstructed Nov. 4, 1935.

HISTORY

Political Developments. Between Jan. 1, 1939 and the outbreak of the European War on September 1, Denmark enjoyed a period of exceptional economic prosperity coupled with steady progress toward the solution of its internal problems. In accordance with the program set forth by Premier Stauning on Oct. 4, 1938, the government in 1939 undertook important revisions of the Constitution designed to democratize the governmental system by abolishing the conservative upper chamber (Landsting) in its existing form, placing more power in the hands of a reorganized lower chamber (Folketing), lowering the voting age, and introducing more frequent use of the referendum.

These reforms were first voted by both houses of the parliament (Rigsdag) that had been in office since 1935. They were then confirmed by the new Rigsdag elected Apr. 3, 1939, but were defeated by a very narrow margin in a popular referendum held May 23. With the approval of 45 per cent of the total electorate required to put them into effect, the amendments lacked only 12,002 of the 978,039 needed votes. The new parliament accordingly reconvened on May 31 under the old system, although the Landsting on May 10 had voted itself out of existence. The Stauning Government, which had retained control of parliament in the election of April 3, indicated that it would try again later to put its constitutional program into effect.

The standing of the parties in the new Folketing, with the former standing in parentheses, was: Social Democrats, 64 (68); Liberals, 30 (29); Conservatives, 26 (26); Radical Liberals, 14 (14); Agricultural (Free People's) party, 4

(5); Justice League, 3 (4); Danish National Socialists, 3 (0); Communists, 3 (2); Slesvig (German Nazi) party, 1 (1). In the Landsting the standings after the 1939 and 1936 elections were, respectively: Social Democrats, 35 (31); Liberals, 18 (22); Conservatives, 13 (15); Radical Liberals, 8 (7); Agricultural party, 1 (0). One member was elected to each chamber from the Faroe Islands. The Social Democratic-Radical coalition government thus retained control by a somewhat reduced minority, while the Communists and Danish Nazis both showed gains.

In the South Jutland district awarded to Denmark from Germany by plebiscite after the World War, all the Danish parties formed a united front to oppose the Slesvig (German Nazi) party. The Danes polled 82,522 votes there against 14,978 for the Germans. Several Nazi propagandists who entered North Slesvig from the Reich to promote the German minority's campaign were expelled by the Danish Ministry of Justice in March. The campaign was marked also by the statement of Fritz Clausen, leader of the Danish Nazis, that Denmark might meet the fate of Czecho-Slovakia unless the government changed its "bolshvist" policies.

Labor Legislation. The government proceeded also to extend the program of labor legislation put into effect in 1938 (see 1938 YEAR BOOK, p. 209-210). A law effective July 1, 1939, provided for annual holidays for all employees on the basis of one day for each month of work or service, or 12 consecutive working days within a year. Upon the outbreak of war, the employers and labor unions followed the practice of the critical depression years and agreed on November 13 to submit all their disputes to mediation. The contract, covering 350,000 workers, barred strikes and lockouts and provided for the regulation of wages in accordance with a price index.

War Conditions and Measures. The outbreak of the European war found Danish industrial production at the highest level in the country's history. The building trades were more active than for several years. Unemployment was lower than at any time since 1931. Exports of industrial and agricultural products were increasing satisfactorily, with prices at good levels. The crop outlook was good, and in many other respects the country was enjoying the most prosperous year in a decade.

The war changed this situation overnight. The prices of Denmark's products, its foreign trade, its foreign exchange holdings, and the activities of the fishing fleet were adversely affected, while prices of imported articles and commodities increased sharply. A long list of emergency measures were adopted by the government in an effort to conserve essential supplies and protect the economic system. They included monetary restrictions, gasoline and fuel conservation programs, rationing and the restriction of imports. Income and property taxes were sharply increased.

These developments soon were reflected in the growth of unemployment totals from 56,000 in August to 174,000 in December and the serious stagnation of economic activity. Early in October all slaughterings of livestock were stopped as a result of the German submarine and mine blockade of Great Britain. Danish agriculture was reported to have sustained a loss of about 2,000,000 crowns daily, until shipments to Britain were resumed. Toward the year end the rapid reduction in the numbers of cattle and poultry indicated a weak-

ening of the Danish agricultural economy. Almost the sole bright spot in the economic picture at the close of 1939 was the large increases in earnings registered by Danish shipping as a result of the war; the gross income for the year was estimated at 500,000,000 crowns against 278,000,000 in 1938. The Danish economic situation would have been considerably worse had it not been for relatively large emergency stocks of essential commodities acquired with part of a 25,000,000-crown national defense loan issued in April.

Foreign Relations. The Danish Government and people strove throughout 1939 to prevent being sucked into the vortex of the European conflict. Denmark was the only one of the Scandinavian states that accepted Chancellor Hitler's April offer of a non-aggression pact. Under the pact signed May 31 the Danish Government gave a formal pledge to remain neutral in any war involving the Reich, while Germany undertook not to resort to war or "any other kind of force" against Denmark. Moreover Berlin expressly acknowledged Denmark's right to engage in normal trade with all belligerents in the event of war.

Upon the outbreak of war, Denmark called up 30,000 men for emergency service in the army and navy, and on September 3 issued a formal declaration of neutrality. The neutrality proclamation voiced the hope that both sides would respect Denmark's borders. On the very next day the seaport town of Esbjerg, West Jutland, was bombed from the air, apparently by a British airman who mistook it for a German naval base. On September 18-19 the Premiers and Foreign Ministers of Denmark, Sweden, Norway, and Finland met in Copenhagen and discussed plans for maintaining their firm neutrality, mutually safeguarding their economic life, and maintaining trade relations with both Britain and Germany. They expressed willingness to undertake reconciliation of the belligerents. A similar meeting was held in Stockholm on October 18-19 by the Kings of Denmark, Norway, and Sweden, the President of Finland and the Foreign Ministers of the four states.

However Denmark, like the other small neutrals of northwestern Europe, was subjected to increasing pressure from Britain and Germany. In mid-September the British began to ration imports into Denmark. On October 1 a Danish freighter was torpedoed and sunk by a German submarine—the first of many such attacks on Danish merchant vessels. Eight vessels of 21,253 gross tons were lost up to Dec. 28, 1939. The devaluation of the British pound caused Danish farmers to sustain a loss on exports to Britain. This was made up by the Danish Government beginning in November. Negotiations for an extension of existing trade agreements with Britain and Germany were opened late in November, and commerce with the Oslo powers was expanded.

The position of Denmark from both a military and economic standpoint became steadily more precarious. The Danes were admittedly unprepared to resist attack from any of the great powers. A wave of indignation swept the kingdom when Finland was invaded by the Soviet Union on November 30. But the Danish Government proclaimed its neutrality in that conflict also, and Danish assistance to the Finns was restricted to private collections of funds and supplies and the enlistment of a few hundred Danish volunteers in the Finnish armies. When a Communist member of the Folketing arose to ask a routine

question of the Minister of Commerce on December 6, every member of that body except two other Communists and the Minister walked out of the building. On the same day the Foreign Ministers of Denmark, Norway, and Sweden met in Oslo to discuss their future course, but the Danish Government declined to depart from its neutral policy in any respect.

See BELGIUM, FINLAND, GERMANY, GREAT BRITAIN, and SWEDEN under *History*.

DENTAL ASSOCIATION, AMERICAN. A national association organized in 1859 and reorganized in 1913:

"To cultivate and promote the art and science of dentistry, and of its collateral branches; to conduct, direct, encourage, support, or provide for exhaustive dental and oral research; to elevate and sustain the professional character and education of dentists; to promote among them mutual improvement, social intercourse, and good will; to disseminate knowledge of dentistry and dental discoveries; to enlighten and direct public opinion in relation to oral hygiene, dental prophylaxis, and advanced scientific dental service, and in relation to the advantages and progress of enacting and enforcing proper, just, and uniform dental laws in the several States; and collectively to represent, have cognizance of, and to safeguard the common interests of the members of the dental profession; with express powers to acquire property for the purposes of the corporation by purchase, deed, gift, bequest, or otherwise, and to hold and administer the same, and to publish dental journals, reports, and treatises."

This object is accomplished by means of an annual meeting at which scientific papers are read and clinics are presented, by the publication of *The Journal of the American Dental Association*, and through the work of various bureaus and committees as follows: Bureau of Public Relations, Library Bureau, Bureau of Chemistry, Council on Dental Therapeutics, Committee on Dental Legislation, Committee on Dental Economics, and Research Commission. The membership, as of Nov. 22, 1939, was 45,300 dentists. The secretary, Dr. H. B. Pinney. Offices are at 212 East Superior St., Chicago, Ill.

DENTAL CARIES. See DENTISTRY.

DENTISTRY. Inquiry into the cause and methods of prevention of dental caries continued throughout 1939 at the same high level that characterized recent preceding years. Scientists and laymen will profit immensely by the compilation of the findings and conclusions of 195 investigators with respect to its cause and control.¹ (For references, see *Bibliography*.) The broad picture of the current situation is admirably presented in the closing pages of this report in the form of a general analysis which was prepared presumably by William J. Gies, secretary of the committee responsible for it.

Caries is still believed to be "a bacterial disease of the calcified dental tissues, producing typical lesions that originate in characteristic locations. The active etiological factor is acid, produced by bacteria on restricted areas often or long enough to enable the acid there to disintegrate the mineral structure."² "The vast and intricate complexity of the causes underlying caries . . . remain to be discovered."³ The formation of strong enough acid to dissolve enamel at these restricted areas within a few minutes after soluble carbohydrates are taken into the mouth and the acid lasts for not much longer than one-half to one hour.⁴ A

large group of observers based on recent work are in general agreement that "civilized ('unnatural') modes of life" and the related "substitutions of refined foods" for the various "natural ones in the native diets," and "the methods of preparation" (cooking, seasoning, canning, storage, etc.) account in general, "when applied to primitives," for the associated marked increase of caries.⁵ "Sugar is a very important causative factor in caries."⁶

In the past determination of caries activity and susceptibility has been based wholly on clinical and X-ray examination. There are grave objections to such methods, of these the most important concern time and reliability. Clinically active caries can be recognized only some months after its actual onset, it is also very difficult to identify inactive caries. At least two reliable laboratory tests have been devised for determining contemporary caries activity (susceptibility) and within the last year both of these have come into extensive use, especially in large clinics and in some individual practices. They are: 1. Quantitative estimations of the numbers of *L. acidophilus* in cultures grown from the patient's saliva on the surface of Kulp tomato-peptone-agar plates supply a direct correlation between the *L. acidophilus* bacteria and caries activity.⁷ 2. Solution of calcium from the enamel during four hour incubation of saliva-glucose-human enamel mixtures at body temperature.⁸ With these tests clinicians and investigators for the first time are now able to estimate caries activity accurately and promptly and almost quantitatively. It is believed that these or similar tests will become an essential part of the periodic examinations of all dental patients, especially those within the lower age levels.

Prevention is still largely limited to long recognized methods based on early recognition of decayed tooth surfaces and suitable treatment by fillings, plus improvement in the dietary program as far as it is compatible with good health in other respects. Many authorities stress the elimination of sugar and refined carbohydrates,^{9, 10} and others emphasize the importance of a high mineral and high vitamin content of the diet.^{11, 12} "There is no dissent from the conclusion that a balanced (adequate) diet, from early childhood (following normal prenatal nutrition), requiring vigorous mastication, favors development of superior jaws, well-formed arches, excellent dentition, physiological tooth-cleansing, and low incidence of caries."¹³ Further confirmation is found for the long existing belief that: "Primitive people, living a natural life free from the stress and strain of modern civilization, and eating foods produced locally, have much less caries than those living under modern conditions."^{14, 15, 16} There is still general agreement that the problem of prevention is at best only partly solved and that satisfactory solution will be delayed till the cause of caries is fully known. Because recent studies have shown that the acid is formed soon after fermentable food is taken into the mouth, the possibility of inhibiting acid formation by the use of mouth washes and dentifrices immediately after eating is being investigated,¹⁷ even including preparations containing fluorine.^{18, 19}

Numerous papers have appeared within the year bearing on the bacteriology, chemistry, and physiology of saliva.^{20, 21, 22} Most of these are either directly or indirectly concerned with caries research. They also throw some light on this body fluid about which so little is known. It

seems quite clear that its composition and general characteristics are quite constant and very difficult to change.

On the basis of methods perfected previously by Schour and his associates for the determination at the rate of formation of enamel, dentin, and cementum as well as bone through the injections of alizarine and fluorine valuable information has been added to the mechanism of tooth development and tooth behavior in disease. "Enamel and dentin of all species studied show a common basic incremental calcification rhythm, which recurs at intervals of 16 microns."²³ Such methods of study have been applied to deciduous tooth hypoplasia. Tooth ring analysis supplies a better understanding of the hypoplastic defects in human teeth, caused by the arrest of enamel (and dentin) formation both at birth and during the period of adjustment after birth (neonatal period). This situation covers most instances of hypoplasia of deciduous teeth as prenatal hypoplasia is extremely rare.²⁴ The statement implies that the part of the tooth which is formed before birth is not damaged, generally speaking, and that prenatal tooth development is not greatly influenced by the mineral metabolism of the mother.

Current orthodontic literature discloses a rising interest in the relationship of heredity to mouth defects and malocclusion. This is not limited to this field as similar interest is shown with reference to dental caries and opalescent dentin.^{25, 26}

Clinical dentistry has been greatly benefited by the research in dental materials carried on at the U.S. Bureau of Standards and in various research laboratories. The current year, however, has seen no great change in clinical methods or practice.

EDWARD H. HATTON.

DENVER, UNIVERSITY OF. A coeducational institution of higher learning in Denver, Colo., founded in 1864. The registration for the autumn quarter of 1939 totaled 3297, while the enrollment

in the 1939 summer session was 1513. The faculty has 311 members. The assets consisted of endowment assets of \$2,631,645 and plant assets of \$1,731,374. The income for the year 1938-39 was \$838,118. The library contained 146,028 volumes. Chancellor, David Shaw Duncan, Ph.D., LL.D.

DEPARTMENT STORE SALES. See BUSINESS REVIEW; MARKETING.

DEPAUW UNIVERSITY. A coeducational institution for higher learning in Greencastle, Ind., under the auspices of the Methodist Church, founded in 1837. The enrollment for the autumn session of 1939 was 1466, including 800 men and 666 women. The faculty numbered 105. The productive funds amounted to \$5,804,244, while the total gross operating income for the year 1938-39 was \$529,189. The library contained 91,024 volumes. John H. Harrison Hall, a building which will house the Departments of Geology, Botany, Zoology, and Psychology, is in the process of construction at a cost of \$350,000. The University received during 1939 a bequest of \$400,000.

DEPOSITS. See BANKS AND BANKING.

DETERDING, dā'tēr-dīng, SIR HENRI WILHELM AUGUST. A Dutch industrialist, died at St. Moritz, Switzerland, Feb. 4, 1939. Born in Amsterdam, Apr. 19, 1865, he was educated at the Hoogere Burgerschool there, and at the age of 16 went to work for the Twentsche Bank. He remained there for six years when he went to work for the Netherlands Trading Society, being sent to the Netherlands East Indies. In 1896 he joined the Royal Dutch Oil Co., a small organization. Through his efforts, facilities for the delivery of oil were speeded up and huge storage tanks built in various cities. In 1900 he was appointed managing director and in 1902, director general.

In 1903, Deterding was responsible for the merger of the Royal Dutch Co., the British Shell Co., and Russian oil fields controlled by the Paris Rothschilds, into the Asiatic Petroleum Co., in which the sales of the organizations were pooled. In 1907 to further production they formed the Batavian Petroleum Co., and to unify the transport, storage, and distribution of oil, they formed the Anglo-Saxon Petroleum Co. Rate wars with the Standard Oil Co. were carried on during 1903 and 1910, and again in 1927 and 1930.

Shortly after the beginning of the century, the Royal Dutch entered the American market and made a survey of Oklahoma oil fields in 1908. In 1912 the s'Gravenhage Association, Ltd., was formed. It bought up several small oil companies in the United States and formed the Roxana Co. Subsequently Shell Union was formed comprising the United States interests, and in 1913, The California Oilfields, Ltd., was bought. In 1918, the Royal Dutch Co. developed Mexican properties. Subsequently, they entered the industry in Egypt, the Near East, and the Argentine.

After the Russian Revolution, Sir Henri, who was given an honorary K.B.E. by the British Government in 1920, claimed the oil fields formerly controlled by the Rothschilds, and which his organization had acquired in 1903, but the Soviet Government refused to consider his ownership. A hater of Communism thereafter, he was an early supporter of Adolph Hitler in Germany, and in 1930, the Soviet Government charged him with being the ringleader of a plot to overthrow the Stalin regime.

In 1937, Sir Henri retired as director general,

although remaining as a director. He also retained a directorship in the Shell Transport and Trading Co., Ltd. In 1934 he published *An International Oilman*.

DETROIT. See MICHIGAN.

DETROIT, UNIVERSITY OF. An institution of higher education in Detroit, Mich., under the auspices of the Roman Catholic Church and conducted by the Jesuit Fathers, founded in 1877. In the autumn of 1939 there were 3166 students registered. The summer school registration was 558. The faculty numbered 201. The endowment amounted to \$1,571,927, while the income in 1938-39 was \$761,426. There were 102,170 volumes in the library. President, the Rev. Charles H. Cloud, S.J., inducted July 9, 1939.

DEWEY, JOHN. See PHILOSOPHY.

DEWEY, THOMAS E. See NEW YORK CITY; REPUBLICAN PARTY.

DIES COMMITTEE. The House of Representatives' committee for the investigation of un-American activities, for brevity the Dies Committee (so-called after its chairman, Representative Martin Dies of Texas), had met with difficulty in its inquiries in 1938 and had asked urgently for the co-operation of the Federal administrative departments. Its existence renewed, the committee began early in August, 1939, a period of full activity that continued into December. During this period the committee no longer sought to rely on administrative co-operation but carried out its inquiry independently. Its discoveries as to the German-American Bund lent significance to the prosecution of Fritz Kuhn, the Bund's leader, in New York City; Earl Browder, who had run for President on the Communist ticket in 1936, admitted to the committee that he had used a false passport in traveling to Europe, and he was thereafter indicted on a Federal charge for this alleged offense. Testimony heard by the committee indicated receipts of heavy sums by the Russian Communist authorities, from sources in the United States, and the Soviet government's payments of money to support agencies working its purposes in the States. It was represented that some Communists had served as spies, collecting military information and secrets of manufacturers. The American Youth Congress, according to one of the committee's informants, was dominated by certain members connected with the Communist party. The American League for Peace and Democracy was in like manner represented as created by Communists in 1935, and the committee issued a list of 563 names of Federal employees purportedly members of this league. Other testimony averred that Communists had strongly influenced the C.I.O., its affiliate the National Maritime Union, and a part of the American Federation of Teachers. Some associations of consumers, such as the Consumers' League, were stated by testimony to be influenced, as to their direction, by agents of the same doctrine.

In the majority of important cases the publication of testimony as to subversive activity in a going organization, Federal or other, drew sharp denials or reproaches from the people directing the organization. In the case of the publication of the 563 names of Federal employees listed as belonging to the American League for Peace and Democracy President Roosevelt, usually non-committal on the proceedings of the Dies Committee, spoke (October 27) of the publication of these names as a "sordid procedure," and the

chairman of the Washington branch of the League charged that the committee had been guilty of a violation of civil liberties.

Hearings on German-American Bund. Fritz Kuhn and others connected with the German-American Bund were questioned in the course of August, September, and October. Kuhn, as a witness, denied that the Bund was an agency of the German Nazi government. He gave the lie to a suggestion that the Bund sought to set up in the United States a government like Germany's. The Bund's members, he admitted, were sworn to defend Germany's good name. Members paying dues, as he estimated, numbered 20,000. A former German Social Democrat, Gerhard H. Seger, testified that Kuhn had been connected with Hitler; in support of this he offered articles published in the *Weekruf*, a German weekly in New York, conducted by Seger. A former Bundist Neil H. Ness, in like vein, told the committee that the Bund's unit in Los Angeles had worked out plans to destroy docks, waterworks, and other essential structures in the Pacific States if ever war should break out between the United States and Germany. A 19-year-old German-born girl, Helen Vooros, related a trip that she had made to Germany in 1938, as a leader in the Youth Movement at the South Brooklyn branch of the Bund, to receive six weeks of training provided for young Nazi workers. Witnesses thus impairing Kuhn's denial of the Bund's serving the Nazi government as an agency raised a serious point as to Kuhn; the committee brought this point out by suggesting to the Department of Justice (October 23) the propriety of proceedings for violating the alien agents registration law.

The committee's investigation of the Bund had nothing directly to do with the concurrent criminal proceedings against Kuhn on the part of authorities in New York City (q.v.).

Communists' Agencies and Activities. Earl Browder, the most prominent of active Communists in the United States, admitted to the Committee (September 5), in the course of testimony, that he had traveled in foreign countries in the previous two years by use of a passport bearing a false name; what name this was, he would not say. Others of his party, he said, had followed the same practice, finding it convenient in passing through countries where Communists were unpopular. Obtaining a passport by use of a false statement was a punishable Federal offense. The Department of Justice, invited by members of the Committee to prosecute Browder, took no immediate action. On October 23 Chairman Dies stated that unless further delay were "necessitated by strong reasons" he would try to have the indictment brought directly by the local District Attorney in New York. The Department of Justice immediately obtained the indictment against Browder, who was arrested on the same day. Released on bail, he awaited trial through the rest of the year.

Among other testimony on alleged Communist action, that of Fred E. Beal, organizer of the textile strike at Gastonia, N. C., in 1929 (see *YEAR BOOK*, 1929, p. 612), and thereafter a prisoner in that State, asserted that he had been sent to North Carolina by William Z. Foster, Communist leader, to organize workers. Beal charged that the International Labor Defense, in defending him of complicity in the murder of Police Chief Aderholt—an incident of the strike

—had hampered his case by bringing in Communist propaganda. An account of the Russian Communist organization's alleged extraction of possibly \$3,000,000 a year from manufacturers in the United States came from Dr. David H. Dubrowsky, an adherent of Russian communism prior to Stalin's supremacy; by far the most of this total was attributed to a charge for advertising, imposed at rates enforced through the Amtorg Corporation, for advertising in Russia the goods that the corporation bought for that country.

The Dies Committee had exerted itself in 1938 to hasten the proceedings of the Department of Labor, for the deportation of the alleged Communist Harry B. Bridges; for the outcome of these proceedings in 1939, see *BRIDGES CASE*.

DIESEL ENGINES. See *ELECTRICAL TRANSPORTATION; ENGINES; RAILWAYS*.

DISASTERS. The major disasters of the year are listed under *CHRONOLOGY*. See also *ACCIDENTS; EARTHQUAKES; FIRE PROTECTION; FLOODS; RAILWAYS; RED CROSS; SHIPPING*. The sinking of the *Squalus* is described in a separate topic entitled *SQUALUS DISASTER*. For shipping disasters incident to the war, see *EUROPEAN WAR* under *The War at Sea*.

DISCIPLES OF CHRIST. A communion known also as the Churches of Christ and sprung from a movement for Christian unity, which arose in American Presbyterian circles at the beginning of the 19th century, under Barton W. Stone, in Kentucky, and Thomas and Alexander Campbell, in Western Pennsylvania. This is the largest religious body having its origin in America. The foreign missionary work in 1939 embraced the Belgian Congo, Africa, China, India, Jamaica, Japan, Mexico, Philippine Islands, Puerto Rico, Argentina, Paraguay, and Tibet (Batang, on the border).

Among the periodicals published by the communion are *World Call*, *Christian Evangelist*, *Christian Standard*, and *Christian Unity Quarterly*. The president of the International Convention for the year was Dr. Roger T. Nooe, Nashville, Tennessee. For statistics, see *RELIGIOUS ORGANIZATIONS*.

DISEASES. See *DENTISTRY; MEDICINE AND SURGERY; VITAL STATISTICS*.

DISTRICT OF COLUMBIA. An area, coterminous with the city of Washington; it is an administrative district under the special laws enacted by the U.S. Congress for its government. It owes its status to Washington's being the National capital, where as contemplated in the Constitution the Federal Government should have the sole jurisdiction. The city of Washington no longer has a political status apart from that of the District, and for political and administrative purposes the District covers the city. Area (1930), 70 square miles, inclusive of 8 square miles of water. Population, census of 1930, 486,869; latest Federal estimate (1937), 627,000.

The District does not choose its governing officers by local election. A Board of Commissioners composed of three Federal appointees, directs the local government. The Commissioners (October, 1939) were Melvin C. Hazen, President of the Board; George E. Allen; and Col. David McCoach, U.S.A., Engineer Commissioner.

Manufacturing. The slight extent of the manufacturing industries, as reported in 1939, indicated the degree to which the city of Washington, largely inhabited by people gaining their living

by work for the Federal Government, did without the material and economic production helpful to the sustenance of most other communities. There were in the District of Columbia in 1937, 469 manufacturing establishments (in 1935, 490); their wage-earners numbered 8714 (in 1935, 8115); they came to 1.4 per cent of the 627,000 estimated to constitute the population in 1937; their wages totaled \$12,848,273 (for 1935, \$11,952,965). They produced goods to the total of \$74,107,967 (in 1935, \$66,231,965), to which they contributed by the processes of manufacture \$42,656,805 (in 1935, \$37,348,118). About one-third of the total of goods produced by the manufacturing factories consisted of \$25,207,998 in newspapers and periodicals—largely or mainly the Washington dailies. Bread and the like, ice-cream, confectionery and other articles of the inhabitants' fare made up much of the rest. Federal operations of a quasi-manufacturing character, such as printing, and the making of money, the production of maps, charts, and diagrams did not appear, as such, in the figures of the Census of Manufactures. They occupied a considerable number of persons, the Government Printing Office, for instance, being a great printing house handling many extensive publications.

Events. The British King George VI and Queen Elizabeth came to Washington for two days (June 8-9), were guests of President and Mrs. Roosevelt, and spent the night of June 7 in the White House. The visit was the first that a reigning British monarch had made to the Federal Capital; it formed the chief event of the tour of friendship that the King and Queen made in the United States in June. The Royal party entered Washington at 11 a.m., June 8; were met by the President and Mrs. Roosevelt in the Presidential reception room at the Station; were saluted in the Plaza by the "21 guns," fired by four three-inch pieces, and by the Marine Band, playing "God Save the King" and "The Star-spangled Banner"; drove past great throngs, to the White House; there, at noon, received members of the diplomatic corps, who were presented to them; made a sightseeing trip, 2:30 p.m., through the city; attended, 5 p.m., a garden party at the British Embassy, to which 1400 had been invited; were the guests of honor, 8 p.m., at a formal dinner of 81 places, at which the President gave a toast to the good relations between Britain and the United States and the King responded. On June 9, the King and Queen were received, 11 a.m., in the rotunda of the Capitol, by the members of the Senate and of the House; joined the President and Mrs. Roosevelt; 12 m., on the yacht *Potomac*; landed, 1:30 p.m. at Mount Vernon, where the King laid a wreath on the Tomb of Washington; went by highway to Arlington, where, 4:35 p.m., the King placed wreaths on the Tomb of the Unknown Soldier and on the Canadian Cross; gave a dinner, 7:45 p.m., at the British Embassy, in honor of the President and Mrs. Roosevelt; and departed by train for New York, 11:30 p.m. Except for unseasonably hot weather on the 8th (94 deg., maximum) the visit was made under ideal conditions.

Congress revised the District's system of revenue, to increase the total as the recent increase of the population might well require; it passed the District of Columbia Tax Act, imposing on persons domiciled in the District an income tax ranging from 1 to 3 per cent of taxable income and at 5 per cent on that of corporations,

authorized yearly Federal appropriation of \$6,000,000 for the District, and repealed existing taxes on intangible personal property and on business privileges, imposing at the same time a personal-property tax on automobiles. A movement was under way in the spring to bring about the purchase, by the Government, of the historic Decatur House, then in the hands of an estate. See AERONAUTICS.

DOHERTY, HENRY LATHAM. An American industrialist, died in Philadelphia, Dec. 26, 1939. Born in Columbus, Ohio, May 15, 1870, he received a public school education and in 1882 entered the employ of the Columbus Gas Co., as an office boy. He remained with this company until 1890 and from then until 1905 he was an engineer, or manager of gas, electric, or traction companies in 29 cities in the Middle West. In 1905 he came to New York where he organized Henry L. Doherty & Co., bankers and operators of public utility corporations. In connection with this company he also organized The Doherty Operating Co., and The Doherty Securities Co. In 1910 he organized and became the president of Cities Service Co., a holding company for more than 190 public utility and petroleum properties, with combined assets of \$1,288,104,833 in 1932. In 1939 Mr. Doherty was listed as president of 54 companies and director of 58.

One of the leaders in the oil industry, Mr. Doherty for many years waged a vigorous fight to arouse the oil industry to conserve oil and eliminate waste and for the government regulation of the production of oil. He also urged the adoption of a program of oil conservation known as "unit operation" of each new pool. His efforts in this latter regard were crowned in 1927 when the American Petroleum Institute, of which he was one of the founders, adopted his program. A disagreement with the ideas of the oil industry in carrying out his program led to his resignation from the Institute in 1931. Although he continued his fight for conservation and control of the industry, the New Deal reforms advocated by the Government he considered too sweeping.

One of the largest real estate holders in the country, Mr. Doherty owned among other parcels of real estate the office buildings at 60 Wall Street (completed in 1932) and at 24 State Street, New York City, at the latter of which he at one time maintained his home. He was a believer in the future of Florida as a resort and after the market crash of 1929 he acquired a chain of palatial hotels there, including the Miami-Biltmore, control of which passed to an associate in 1938.

Mr. Doherty had about 150 patents to his credit and in 1898 was awarded the first Beall Gold Medal by the American Gas Light Association for a paper on "Gas for Fuel." In 1930 he received the Walton Clark medal of the Franklin Institute "in consideration of his outstanding and valuable work in development of the manufactured gas industry," and in 1937 he was awarded the Anthony F. Lucas gold medal for "distinguished achievement in improving the prac-

tice of finding and producing petroleum" by the American Institute of Mining and Metallurgical Engineers. He was a member of the American Association for the Advancement of Science and served as president of a number of Associations connected with the lighting industries. Lehigh University gave him the honorary degrees of D.Eng. (1931) and LL.D. (1937) and Temple University the honorary LL.D. (1937), and in 1938 elected him the board of trustees of the University. From 1934 to 1937 he served as national chairman of the President's Birthday Ball, which sponsors a series of dances throughout the country on January 30, the birthday of President Roosevelt, for the benefit of infantile paralysis sufferers.

DOMESTIC RELATIONS. See **LAW** under *Private Law*.

DOMESTIC TRANSPORT. See **AERONAUTICS**.

DOMINICA, dŏm'i-nē'ka or dŏ-mīn'i-ka. A British island colony in the West Indies. Area, 305 square miles; population, 41,000. Capital, Roseau (6803 inhabitants). Chief products are timber, coffee, and tropical fruits. On Jan. 1, 1940, Dominica became officially a separate colony within the Windward Islands group, having been previously (since 1833) under the jurisdiction of the governor of the Leeward Islands.

DOMINICAN REPUBLIC. A West Indian republic, occupying the eastern two-thirds of the island of Hispaniola (Haiti). The name of the capital was changed from Santo Domingo to Ciudad Trujillo, Jan. 9, 1936.

Area and Population. Area, 19,332 square miles; population, estimated on Dec. 31, 1937, at 1,581,248. About 40 per cent of the inhabitants are white (mainly of Spanish descent), 40 per cent mixed, and 20 per cent Negro. Foreigners at the 1935 census included 52,657 Haitians, 9272 British subjects (mostly West Indians), 3221 Puerto Ricans, 1572 Spaniards, and 1467 United States citizens. Populations of the chief cities (1935): Ciudad Trujillo, 71,297; Santiago de los Caballeros, 33,919; San Pedro de Macoris, 18,889; Puerto Plata, 11,777. Language, Spanish.

Defense. Defense forces include an army of about 300 officers and 3000 men; an aviation corps; 1 armed transport, 1 gunboat, and 4 armed coastal patrol ships. The national constabulary was organized as an auxiliary arm of the army in 1936. Defense budget for 1939, \$1,879,000.

Education and Religion. About 20 per cent of the adult Dominicans were literate in 1935. In 1939 there were 947 primary schools, with slightly over 103,000 pupils, 6 secondary schools with 1550 students, 12 vocational schools with 3300 students, 3 normal schools with 2000 students, and the University of Santo Domingo (founded 1558), with 350 students. About 97 per cent of the Dominicans are Roman Catholics.

Production. Agriculture supports about 80 per cent of the population. Raw sugar accounted for 59 per cent of the value of all exports in 1937 and 1938. Sugar production for the season ended Sept. 1, 1939, was 431,705 metric tons. The 1938 shipments of the three other chief exports were (in metric tons): Cacao, 28,366; coffee, 8394; molasses, 109,196. Corn, citrus fruits, rice, bananas, starch and tapioca, potatoes, beans, onions, peanuts, and pineapples are other crops. Livestock in 1935: 913,128 cattle, 879,991 swine, 373,204 goats, 265,881 horses, 137,678 asses, 44,528 mules, and 34,829 sheep. Forests yield ma-

hogany, espinillo, lignum-vitae, cedar, and other cabinet and dye woods. Gold production in 1938, 199 kilograms. Sugar refining accounts for 91.8 per cent of the persons employed in industrial enterprises.

Foreign Trade. Imports in 1938 totaled \$11,342,000 (\$11,692,000 in 1937); exports, \$14,347,000 (\$18,120,000). The United States supplied 54 per cent of the 1938 imports, Japan 11, Germany 8, and the British West Indies 5 per cent. Of the exports, the United Kingdom took 42 per cent, United States 32, France 8. Values of the chief exports in 1938 were: Raw sugar, \$8,582,062; cacao, \$1,915,324; coffee, \$1,039,309; molasses, \$615,842.

Finance. The budget for 1939 placed revenues at 11,595,000 pesos (11,694,000 in 1938); expenditures, 11,483,000 pesos (11,682,000 in 1938). In 1937 actual receipts were 11,562,000 and expenditures 11,390,000 pesos. Foreign debt on Dec. 31, 1938, \$15,604,000; internal floating debt on Dec. 31, 1937, estimated at not less than 2,600,000 pesos (peso equals one U.S. dollar). In addition the Dominican Government on Jan. 31, 1938, agreed to pay the Haitian Government \$750,000 for damages suffered by Haitian nationals on Dominican territory in 1937. Of this sum \$250,000 was paid on Feb. 28, 1938 and \$100,000 was due on January 31 of each succeeding year for five years.

Transportation. In 1939 there were two railways with 147 miles of line; 3925 miles of highways; a regular station of Pan American Airways at San Pedro de Macoris; a deep-water port at Trujillo City and ports accessible to smaller vessels at Azua, Barahona, Frontier, La Romana, Monte Cristi, Samaná, and Sánchez. The British-owned Samaná-Santiago railway was purchased by the government for \$50,000 in 1939, making both railways state property.

Government. The Constitution of June 20, 1929, revised as of June 9, 1934, vests executive power in a President elected for four years by direct vote. There is a Congress of 13 Senators and 35 Deputies, elected for four years by direct suffrage of literate males. However Gen. Rafael Leonidas Trujillo Molina's Dominican party is the only political organization permitted. Trujillo was President of the republic from Aug. 16, 1930, to Aug. 16, 1938, when he was succeeded by his own candidate, Dr. Jacinto B. Peynado, elected May 16, 1938 (see 1938 YEAR BOOK, p. 213).

HISTORY

Trujillo's Dictatorship. Although he had turned over nominal leadership to President Peynado in 1938, ex-President Trujillo retained firm control over the government and country throughout 1939. Legislation was passed establishing a social welfare system and providing subsidies for the newly organized Dominican steamship line which initiated a West Indian service with a converted naval vessel on Dec. 10, 1938. To finance these measures and offset declining budget revenues, a sales tax was imposed on domestic and imported rice and the registration fee on certain imported medicines and pharmaceutical specialties was tripled. The government also placed in effect the law signed Dec. 21, 1938, providing that 70 per cent of the employees of all commercial, industrial or agricultural enterprises must be Dominican citizens and that they should receive 70 per cent of the total payroll. It was announced at the dedication of the Dominican

Pavilion at the New York World's Fair on May 20 that the Dominican Government would award annually a Trujillo Peace Prize of \$50,000 to the individual or organization making the most outstanding contribution to peace.

On June 29 Trujillo in a message to the nation announced that he was going abroad but that if his regime was interrupted in any way during his absence he would return immediately to deal with the situation. He arrived in Washington via Miami on July 6, was received with diplomatic honors despite criticism of the visit addressed to President Roosevelt by the Committee for Dominican Democracy, and proceeded to New York and the World's Fair, where further official courtesies were tendered. General Trujillo then went to France, arriving August 7. On August 24 the Dominican Legation in Paris announced that he had been named special ambassador in France and would present his credentials in September. Upon the outbreak of the European war, however, Trujillo returned to the United States and then proceeded to the Dominican Republic late in October. It was learned on October 1 that Gen. Ramón Vazquez Rivera, former Chief of Staff of the army, had been imprisoned at Ciudad Trujillo on a charge of conspiring against the government. He had resigned as Dominican consul general at Bordeaux, France, in 1938.

Speculation in the prices of foodstuffs and other necessities led the government on September 13 to regulate the importation, exportation, sale, and distribution of specified products. A National Committee of Foodstuffs was established to fix maximum prices and prevent hoarding.

Foreign Relations. Dominican foreign policy during the year appeared somewhat equivocal. Early in 1939 the government authorized the United States Navy to use Samaná Bay on the east coast of the island as a base for the winter maneuvers in Caribbean waters. About the same time the German Minister to Central America visited Ciudad Trujillo, ostensibly to negotiate a barter deal. Reports that the Dominican Republic was cultivating close relationships with Germany and planned to supply fuel oil to German submarines operating in Caribbean waters in wartime were denied by the Dominican Minister to the United States on March 22. A few days later the Dominican Foreign Office announced that it would not recognize the Franco regime in Spain unless the United States did so, acting "in accordance with the declarations . . . of General Trujillo to the effect that Dominican foreign policy regarding extra-continental issues would be guided by and in harmony with the foreign policy of the United States."

Upon his return to the United States in September, Trujillo declared that the United States must take the lead in unifying the Americas and that the Dominican Republic would follow Washington's lead. A few days later he declared that his efforts over a nine-year period to end the United States customs receivership in the Dominican Republic had "failed in the face of an imperialistic attitude." He said he had exchanged letters with President Roosevelt regarding the matter in July but that no agreement was reached. In the same interview, Trujillo criticized the South American republics for failing to support his proposal for an American League of Nations or to contribute funds toward the Columbus Memorial Lighthouse project at Ciudad Trujillo.

During October the San Juan, P.R., corre-

spondent of the *New York Times* wrote that French cruisers from Martinique were scouring Dominican waters following repeated reports that German submarines were being secretly refueled there, and that a Dominican Coast Guard cutter had been sunk off Cape Frances Viejo in a collision with a French warship. These reports were vigorously denied by Dominican officials. Shortly afterward Dominican newspapers reported that the Dominican steamer *Hispaniola* was held by the French authorities at Martinique on unannounced charges. Retirement of William E. Pulliam as General Receiver of Dominican Customs was announced by the State Department at Washington in December.

After failing to pay the \$100,000 due Haiti in January, 1939, under the Dominican-Haitian treaty of Jan. 31, 1938 (see 1938 YEAR BOOK, p. 213), the Dominican Government on February 17 paid the Haitian Government \$275,000 in a lump-sum settlement of the outstanding indebtedness. This was followed in March by an unexpected two-hour interview between ex-President Trujillo and President Stenio Vincent of Haiti at Cercadillo on the Dominican side of their mutual frontier. In October Trujillo permitted Col. Demosthenes P. Calixte, former commandant of the Garde d'Haiti, and other prominent Haitian political exiles, to transfer their headquarters from New York to Ciudad Trujillo. In Haitian circles this was viewed as evidence of an unfriendly attitude on the part of the Dominican dictator toward the Vincent Government.

Refugee Settlement. General Trujillo announced at Washington on October 25 before returning home that refugee families to the number of 500 would be admitted to the Dominican Republic without payment of the usual \$500 immigration fee. He stated that his government would welcome the refugees "with humanitarian feeling" and that he would personally be responsible for the upkeep and education, for a period of two years, of a number of young people who will come with those families."

DRAMA. The year opened auspiciously in New York with January notable for the great preponderance of its genuine successes and otherwise creditable mid-season novelties over the casualties. First on the calendar was *Mamba's Daughters*, a dramatization of Dorothy and DuBose Heyward's tragic novel of life among the Charleston, South Carolina, Negroes, in which Ethel Waters, previously best known as a picturesque colored entertainer and singer in revues, disclosed unsuspected powers as an actress and was competently supported, under the direction of Guthrie McClintic, by several other players of her own race and by Jose Ferrer on the white side. Then came *The Primrose Path*, by Robert Buckner and Walter Hart, a George Abbott offering popularized, be it hoped, at least as much by virtue of laughable characterizations as by its deplorably low moral tone. For this occasion Helen Westley temporarily forsook the screen to enact a role after her own heart. Then a Group Theatre production, Irwin Shaw's *The Gentle People*, an odd sort of crook play with

the usually ingratiating Franchot Tone, another prodigal returned from Hollywood, portraying a gangster who meets a well-deserved violent fate. Sam Jaffe, Roman Bohnen, Sylvia Sidney, and Elia Kazan were other members or guests of the Group involved. And besides these three the very first week of 1939 inaugurated also a visit from the ever-welcome D'Oyly Carte Opera Company in their familiar repertory of Gilbert and Sullivan items. Next followed the American presentation of a London hit, *Dear Octopus*, by Dodie Smith, an extraordinarily charming and heart-warming comedy of English family life acted nothing short of exquisitely by Lucile Watson, Rose Hobart, Alice Belmore Cliffe, and a child named Helen Renee, and very delightfully by Reginald Mason, Jack Hawkins, Margaret Dale, Lillian Gish, and various other members of the well-selected cast. But for some inexplicable reason the run of *Dear Octopus* was briefer than that of any other January arrival here recorded, even of one of the semi-occasional revivals of so stereotyped a work as Oscar Wilde's farce-comedy, *The Importance of Being Earnest*, done by a fairly imposing company that included Clifton Webb, Estelle Winwood, Derek Williams, Helen Trenholme, Hope Williams, and Florence McGee.

Set to Music, a revue composed and staged by Noel Coward, with Beatrice Lillie as its bright particular star and Richard Haydn as a lesser feature, though moderately successful, was hardly up to the Coward standard. But an elaborately spectacular drama by George S. Kaufman and Moss Hart, *The American Way*, with incidental music by Oscar Levant, portraying episodically the career and adaptability of a most desirable type of German immigrant in the United States, served comfortably to fill the vast (Rockefeller) Center Theatre until summer. Its tremendous cast was headed by Fredric March, Florence Eldridge, McKay Morris, and Ruth Weston. The month ended with a notable production by Maurice Evans of Shakespeare's *King Henry IV* (Part I) in which he himself acted the role of Falstaff, Edmond O'Brien that of Prince Hal, Wesley Addy was the Hotspur, and Mady Christians the Lady Percy, scoring a total of 74 performances, something of a record for one of the less familiar Shakespearean dramas.

February too was sprinkled, though less plentifully, with occasions of some note in the theatre. An English version of Stefan Zweig's Biblical tragedy, *Jeremiah*, of the vintage of Great War days, was staged by the Theatre Guild with a huge cast headed by Arthur Byron as King Zedekiah and Kent Smith in the title role, but met with slight favor. Vastly better was the lot of *One for the Money*, an altogether charming, clever, and novel revue by Nancy Hamilton in which fresh and unfamiliar talent was presented against an uncommonly tasteful setting. Even greater, if less understandable, success attended a tawdry work purporting to disclose the private life of the Florodora sextette girls of long ago; title, *I Must Love Someone*. A musical comedy by J. P. McEvoy, *Stars in Your Eyes*, with lyrics by Dorothy Fields and airs by Arthur Schwartz, proved a popular medium for the arts of Ethel Merman and the antics of Jimmy Durante. And in Lillian Hellman's *The Little Foxes*, Tallulah Bankhead made much of an opportunity for effective character-acting by portraying a heartless, money-grubbing virago of almost murderous dis-

position, with excellent support, partly in kind, partly in contrast, from Patricia Collinge, Frank Conroy, Lee Baker, Charles Dingle, Carl Benton Reid, Florence Williams, and Dan Duryea. The run of this play survived the summer and lasted out the year.

March was distinguished by but two productions of real note—*Family Portrait*, by Lenore Coffee and William Joyce Cowen, a profoundly conjectural work on the possible reaction of the members of the household of Jesus of Nazareth to His life, career, death, and memory, beautifully and reverently enacted by a well-chosen company, especially by Judith Anderson as the Mother of Jesus, by Margaret Webster (who also directed) as Mary Magdalene, and by Evelyn Varden as a third Mary; and Philip Barry's *The Philadelphia Story*, an entertaining comedy of certain phases of high life in that austere city, written for Katharine Hepburn and skillfully cut to measure to demonstrate to the best advantage the growth of her talent since her last previous appearance on the New York stage some five years back. Capital work was likewise done in this play, which also had a run lasting beyond the year, by Shirley Booth, Joseph Cotten, Van Heflin, Forrest Orr, Nicholas Joy, and Vera Allen. Completeness demands the addition to the record of *The Hot Mikado*, one of the season's two "swing versions" of the Gilbert and Sullivan masterpiece, this one with a Negro cast headed by Bill Robinson, a production which was later transferred, in abbreviated form, to the New York World's Fair.

April, similarly, is remembered for only two entirely new offerings. One was a highly original joyous allegory, *My Heart's in the Highlands*, about a struggling but irresponsible poet, his young son, and his dead wife's Armenian mother, written by William Saroyan, himself an Armenian, and most engagingly performed by Philip Loeb, young Sidney Lumet, Hester Sondergaard, Art Smith as a superannuated actor, William Hansen as a sympathetic groceryman, and other whimsical spirits, including two more pleasant youngsters, Jackie Ayers and Mae Grimes. This was a Group Theatre presentation. The other was S. N. Behrman's bright, sophisticated piece, *No Time for Comedy*, with Katharine Cornell appearing for the first time in several years in the fashionable finery of the day. The star's own attractive performance was ably seconded by those of Laurence Olivier, Margalo Gillmore, John Williams and Robert Flémyng. These two items, together with sufficient new material injected into the revue, *Pins and Needles*, current since the autumn of 1937, to warrant the term 1939 Edition, brought the season to a close.

During the vacation period the summer theatres throughout the country displayed approximately average activity, with the customary division of their efforts between revivals of established successes and tryouts of new works tentatively designed for future use on the regular commercial stage. Few of the latter had reached their goal, however, when the year ended.

Except for the early July opening of a musical item, *Yokel Boy*, employing the talents of Buddy Ebsen, the three Canovas, and numerous other entertainers, and a late August presentation of a more than usually unblushing edition of George White's *Scandals*, featuring Willie and Eugene Howard, it was mid-September before the new season was definitely under way.

The first novelty then disclosed was the *Straw Hat Revue*, a pleasant and highly diverting set of sketches, songs, and dance numbers assembled from the weekly programs of a semi-professional Pennsylvania summer organization. Most of the skits were the work of Max Liebman, the lyrics and tunes by Sylvia Fine and James Shelton. The amusing Imogene Coca was the chief performer, ably aided and abetted by Danny Kaye, Alfred Drake, Ruthanna Boris, Bronson Dudley, and various other members of the group. Then came an hilarious, slap-dash farce, *See My Lawyer*, by Richard Maibaum and Harry Clork, played by Milton Berle, recruited from the musical stage for the occasion, Millard Mitchell, Teddy Hart and, later in its course, Ezra Stone.

But it was October that really set the pace with a quick succession of decisive hits. First in order was Samson Raphaelson's *Skylark*, a comedy on an evidently not quite threadbare topic, the neglected wife, made memorable by the delightful, spontaneous, resourceful acting of Gertrude Lawrence, with excellent support from Donald Cook, Glenn Anders, and Vivian Vance. The next was *The Man Who Came to Dinner*, written to order for, and to the measure of, Alexander Woolcott, who, however, upon its tardy completion found himself prevented by other contracts from portraying the character patterned after his own personality, foibles, and idiosyncrasies. George S. Kaufman and Moss Hart were the joint authors and the chief role was played by Monty Woolley with complete success from the standpoint of amusement, with Edith Atwater, Carol Goodner, and John Hoysradt also pleasantly involved. Then *Ladies and Gentlemen*, an adaptation from the Hungarian of Ladislav Bus-Fekete by Charles MacArthur and Ben Hecht for the express use of Mr. MacArthur's wife, Helen Hayes, an agreeable though undistinguished comedy concerned with the jury of a protracted murder trial to which distinction was added by the acting of Miss Hayes and Philip Merivale. Fourth in order came a musical piece, *Too Many Girls*, with book by George Marion, Jr., and score by Rodgers and Hart, a gay, lively work dealing with college life, football, etc., whose cast was competently headed by Marcy Wescott, Hal LeRoy, and Mary Jane Walsh. And finally William Saroyan's *The Time of Your Life*, an interesting, highly optimistic drama of human values written in a style original with this extraordinary Armenian author, defying all known laws of play construction yet achieving the desired goal notwithstanding. This production was under the combined auspices of the Theatre Guild and Eddie Dowling, with the latter figuring also as co-director (with Mr. Saroyan) and as principal actor, in which capacity he was given valuable support by Julie Haydon, Edward Andrews, Len Doyle, and an admirably selected array of other talent. In contrast to these triumphs October brought also one creditable failure in an offering by the Surry Theatre group, from Maine, of Chekhov's baffling *Three Sisters*, an item so characteristically Russian that, no matter how ably it is staged in other languages, English particularly, it seems to lack the elements essential to popularity.

In November the hits and the casualties were about evenly divided. But the seven or eight items in the latter category were fully offset by the arrival of several of the more noteworthy presentations of the autumn season. In *Margin for*

Error Clare Boothe turned from her familiar brand of withering satire to melodrama, touching upon present-day Nazi complications in our own United States, with Bert Lytell, Otto L. Preminger, Sam Levene, Elspeth Eric, Bramwell Fletcher, and Leif Erickson among those engaged in voicing her characteristic incisive dialogue. Out of the late Clarence Day's delectable volumes of boyhood recollections of his home life and his parents Howard Lindsay and Russell Crouse concocted a comedy to which was applied the title of the first of Mr. Day's books in the series, *Life With Father*. And although the verisimilitude of the characters of the play to those doubtless truthfully portrayed by the autobiographer was open to serious question, and although most of the action of the stage version was original with the dramatists, there was no question whatever as to the amusing and enjoyable qualities thereof. Mr. Lindsay himself had the role of Father and played it with broad humor, occasionally approaching caricature, while his wife, Dorothy Stickney, was wholly engaging as Vinnie, or Mother. The part of the eldest of the four Day boys, Clarence, Jr. (the ultimate author), for whose benefit a thread of adolescent love was inserted, was pleasantly taken by John Drew Devereaux, grandson of the late John Drew. Then in *Very Warm for May* those experienced purveyors of musical comedy, Oscar Hammerstein, 2nd, and Jerome Kern, joined forces again after a considerable interval and turned out a gay and tuneful sample of their co-operative efforts, equipped with a plot concerned with an experimental summer theater workshop, thereby providing broad scope for action and stage effects. Jack Whiting, Eve Arden, Grace McDonald, and Frances Mercer were among those prominently occupied with the singing, dancing, romantic, or comic features, and the veteran Donald Brian appeared briefly in the opening scene in a straight role.

Another dramatization from a book was *The World We Make*, Sidney Kingsley's acting version of Millen Brand's novel, *The Outward Room*. This story of a young girl whose mind gives way under the stress of unhappy home life and grief, who escapes from the mental institution to which she has been committed, and eventually works out her own salvation by ministering to the needs of others made an uncommonly heart-warming play. The part of the girl was competently filled by the actress who calls herself simply Margo, and two other important roles were correspondingly well handled by Herbert Rudley and Rudolph Forster. One of the settings, a commercial steam laundry in operation, was exceptionally realistic. Maxwell Anderson's fall contribution was *Key Largo*, a poetic tragedy of idealism, treachery, and redemption against a background of the recent war in Spain and, later, of the portion of Florida that gave the piece its name. For the principal character Paul Muni was lured back to the speaking stage and gave a distinguished performance. Uta Hagen and Jose Ferrer also participated to excellent advantage. Last, but far from least, of the more notable events of November was the appearance of Ethel Barrymore in Noel Langley's *Farm of Three Echoes*, a comedy (as here played) with a South African setting. The star's role was that of Ouma Gerart, an eccentric matriarch of 97 years, four years younger than her last previous part in *Whiteoaks*, and although there is ground for the

impression that the author regarded the character, with its psychic phase, seriously, Miss Barrymore portrayed it as a straight comedy creation with altogether delightful effect. McKay Morris figured briefly and vividly as her hated son, and Ann Dere, Dean Jagger, and Priscilla Newton likewise gave genuine support.

Other creditable, though less noteworthy, items in the November program were Robert Ardrey's *Thunder Rock*, staged by the Group Theatre, a drama of life in an isolated lighthouse with ghostly complications, which, for a short period only, employed the talents of Luther Adler, Morris Carnovsky, Frances Farmer, Myron McCormick, Art Smith, and Roman Bohnen; and Paul Osborn's whimsical comedy of middle age, *Morning's at Seven*, which, with Jean Adair, Dorothy Gish, Kate McComb, Effie Shannon, John Alexander, Enid Markey, Thomas Chalmers, Russell Collins, and Herbert Yost all agreeably involved, more than lasted the year out. Among the failures the most colossal was *Swingin' the Dream*, the much-publicized effort to inject modern dance rhythm into Mendelssohn's music and a Negro cast into Shakespeare's *Midsummer Night's Dream*.

December, in so far as its new productions were concerned, proved calamitous despite fairly high, though, alas, not well-founded, expectations from such offerings as Frederick Lonsdale's *Foreigners*, to appear in which Richard Ainley came all the way from England; Lesley Storm's London light comedy hit, *Tony Draws a Horse* (William A. Brady, the New York producer, changed Tony to Billy), imported for the use of Grace George; J. B. Priestley's *When We Are Married*, as presented with Estelle Winwood, Alison Skipworth, J. C. Nugent, Tom Powers, Ann Andrews, and A. P. Kaye; *Kindred*, by Paul Vincent Carroll, author of two recent successes in as many seasons, as played by Aline MacMahon, Barry Fitzgerald, Arthur Shields, Wallace Ford, and Aideen O'Connor; and Dr. Gustav Eckstein's clinical, psycho-analytical *Christmas Eve*, painstakingly staged by Guthrie McClintic with a cast including Katherine Locke, Beth Merrill, James Rennie, Mildred Natwick, Kent Smith, and young Sidney Lumet. But the month was not entirely in the red column, for Maurice Evans brought back for a limited return engagement his unabridged production of *Hamlet* with virtually the same personnel as on its first visit, and Ethel Merman and Bert Lahr arrived as co-stars in B. G. de Sylva, Herbert Fields, and Cole Porter's *DuBarry Was a Lady*, a brazenly indecorous but exceedingly mirthful musical that promptly took rank as the most sought-after item in its current category.

English Production. London, notwithstanding her preoccupation with the menace of imminent warfare, calmly indulged in a far more active winter and spring season than did more mercurial Paris, where play production was uncommonly light. In fact, the British equivalent of America's International Ladies' Garment Workers' Union shrewdly judged the moment opportune for staging a biting satire on "appeasement," with music, entitled *Babes in the Wood*, which was privately produced to elude the censorship and became quite the rage. And as if in preparedness for the need of amusement when war should break out, there was a sudden influx of new plays. Among them, *They Walk Alone*, by Max Catto, was sheer, stark melodrama with

psychic implications, an artistic presentation, however, with Beatrix Lehmann and Carol Goodner. Noel Coward's *Design for Living*, several years after its appearance in America, was received without much acclaim though with a cast including Anton Walbrook, Diana Wynyard, Rex Harrison, and Alan Webb. Lesley Storm's comedy, *Tony Draws a Horse*, later to fail in New York, scored a substantial run, despite its tame humor, with Lilian Braithwaite and Diana Churchill in its leading roles. *Gas Light* was another skilfully contrived melodrama by the author of the earlier thriller, *Rope*; while *Little Ladyship*, an adaptation by Ian Hay from a Hungarian source, succeeded in spite of its commonplaceness.

The peak of the season arrived with March, at which time J. B. Priestley's symbolic *Johnson Over Jordan*, an ambitious and interesting modern morality play speculating on what may come after death, was seen, though but briefly. Better fortune attended Basil Bartlett's translation of François Mauriac's *Asmodée*, an outstanding success of the previous year at the Comédie Française in Paris. The English version of this tragedy of misdirected loves, which conveys an effect of new and original dramatic form, was first offered at one of London's smaller theaters and later, by virtue of its popularity, transferred to a larger house and retitled *The Intruder*. The acting organization of the Comédie Française itself came over for a welcome visit in a limited repertory of familiar French classics. Karel Čapek's posthumous and oddly prophetic drama of the invasion of his natal Czecho-Slovakia, *The Mother*, in a translation by Paul Selver and Miles Malleson, attracted more interest in England, despite its confusing argument and ghostly characters, than it was subsequently to do in America, yet Benn Levy's *The Jealous God*, a serious treatise on the dangers of the divided purpose, was promptly rejected. Ghostly characters figured again, though clumsily, in Keith Winter's unimpressive *We at the Crossroads*. But Arthur Macrae, a young actor, disclosed, in *Sugar Plum*, a pleasant new light talent as a playwright besides appearing in his own work along with Ronald Squire and Kay Hammond, daughter of the late Sir Guy Standing.

As the season entered upon its downward curve came a drama by T. S. Eliot, *The Family Reunion*, written in fairly free verse and emphasizing the difficulty of successfully combining, without incongruity, Greek legend, such as that of Orestes, with modern English scenes and characters. Leslie Banks made an appearance in a grisly, pseudo-scientific melodrama, Barré Lyndon's *The Man in Half Moon Street*, and Ivor Novello, with his agreeable, tuneful musical piece, *The Dancing Years*, solved the problem of how to keep the vast Drury Lane Theatre profitably going in the off-season for pantomime and the like. In this he was competently abetted by Mary Ellis, back in a singing role. And Aubrey Danvers-Walker contributed a realistic study of life in the north of London with *Heaven and Charing Cross*. To these were presently added a couple of plays emanating from the United States—John Steinbeck's *Of Mice and Men*, which, with a British cast, was so enthusiastically received as shortly to outgrow the little Gate Theatre, where it was first shown, for a larger house; and Clare Boothe's *The Women*, whose bitter satire was found puzzling by Londoners.

At Easter time the 60th annual Shakespeare

festival was observed at Stratford-on-Avon where, in recent years, the new Memorial Theatre has developed into a prosperous institution. The novelty for 1939 was a production, under the direction of Theodore Komisarjevsky, of *The Taming of the Shrew* with the ordinarily negligible part of Christopher Sly promoted to chief prominence and played by Jay Laurier, while the Katharine and Petruchio were Vivienne Bennett and Alec Clunes. This was followed by a considerably less noteworthy presentation of *As You Like It*.

Late spring gave London an interesting, straightforward drama of the fortunes of two sisters, the first play from the pen of H. E. Bates, the novelist, which he called *Carrie and Cleopatra*; also Rutherford Mayne's distinguished work, *The Bridge*, imported from Dublin's Abbey Theatre, with Wilfrid Lawson as Stephen Moore; and an engaging new light comedy, *Grouse in June*. Then followed several items from France—a translation by Rodney Ackland of Alfred Ghéris's *Sixième Étage*; Jacques Deval's *Behold the Bride*, written in English, which had the much-needed advantage of an illuminating portrayal by Luise Rainer; and a version by J. Leslie Frith of Jean-Jacques Bernard's *The Springtime of Others*, an old piece revived. *Rhondda Roundabout*, by Jack Jones, disclosed a significant, more or less symbolic drama dealing with the crisis induced by the decline of the coal industry in Wales. Basil Sydney and Margaret Rawlings resuscitated Shaw's *Pygmalion*, and Roland Pertwee and Harold Dearden figured as the authors of an ingenious and adroit mystery and surprise play, *To Kill a Cat*. An especially interesting event of June was a visit of the Royal Theatre company of Greece with their impressive productions, in modern Greek, of *Hamlet* unabridged and the *Electra* of Sophocles.

In July John Gielgud brought to a close the distinguished career of the historic Lyceum Theatre, about to be torn down, with his new, reconsidered and matured portrayal of *Hamlet*. Fay Compton was the Ophelia and George How the Polonius. Terence Rattigan, author of the extraordinarily successful comedy, *French Without Tears*, tried his hand at a serious play in *After the Dance*. And two American works—Sidney Howard's *Alien Corn* and Irwin Shaw's *The Gentle People*, both equipped with British casts, received cordial welcomes upon their first showing in London. With summer came the usual open-air performances of Shakespeare in Regent's Park, *A Midsummer Night's Dream* and *Julius Caesar* proving the favorites for the season. August witnessed also a new modern morality play based on the legend of Doctor Faustus in *The Devil to Pay*, by Dorothy L. Sayers.

The annual Malvern Festival of Drama in the same month was pronounced an artistic failure. Three of the half dozen new works there disclosed were distinct disappointments—James Bridie's *Let Them Say*, S. I. Hsiung's *The Professor from Peking*, and one entitled *Dead Heat* by Sir Robert Vansittart, the distinguished diplomat; of the remainder, *Old Master*, by Alexander Knox, gave evidence of real promise. *Big Ben*, by Evadne Price and Ruby Miller, proved a typical commercial item rather than what is expected out of Malvern, while the last was Bernard Shaw's attempt to whitewash the reputation of Britain's Merry Monarch, Charles II, in *Good King Charles's Golden Days*, and,

as such, commanded at least respectful attention.

The London autumn season was just about getting under way, mainly with trivialities though also with a delightful revival of Wilde's *The Importance of Being Earnest* by John Gielgud with himself, Edith Evans, Jack Hawkins, Peggy Ashcroft, and Gwen Ffrangcon-Davies in its bill, when the long-impending hostilities broke out and the theaters in the city proper were closed by Government regulation as a precaution in the event of air raids. For some weeks thereafter various aggregations went a-touring, while others confined their activities to the small playhouses off the beaten track. In one of these a revised and improved version of J. B. Priestley's *Music at Night* was staged, and in another, used as a temporary shelter for the Old Vic, *Romeo and Juliet* was presented with Robert Donat, the screen star, and Constance Cummings in the title parts and Marie Ney as the Nurse, with all three regarded as miscast. But as time went on and nothing much occurred to cause alarm, the restrictions were gradually lifted and the West End houses resumed operation, mainly with established hits of the lighter kind, such as Jack Hulbert and Cicely Courtneidge's gay revue, *Under Your Hat*, though also with an occasional serious item selected for timeliness of theme, for example Elmer Rice's dramatic tale of the rise and fall of a dictator, *Judgment Day*. A new production of the more sober order was Max Catto's *Punch Without Judy*. Another was an uncommon type of murder play, *Ladies in Retirement*, by Edward Percy and Reginald Denham, which had Mary Clare and Mary Merrall for protagonists; and still another a none-too-successful effort to condense Dickens' *Great Expectations* into the confines of a stage version. By Holiday time nearly 30 first-grade theatres were in use, slightly more than were operating in New York. And the year ended with Beatrice Lillie's appearing, at her best, in a new revue, *All Clear*; with an offering entitled *You, of All People*, chiefly noteworthy for the presence of Leslie Banks and Margaret Rawlings in its cast; and with a modern-dress production of Shakespeare's *Julius Caesar* in which Godfrey Tearle was the leading figure.

The other London, in Ontario, was the scene, in April, of the Canadian Dominion's seventh annual Drama Festival, in the course of which some 14 plays were offered in competition by "Little Theatre" organizations from the various provinces.

The Continent. The French theater, as already indicated, was quiescent throughout most of the year. The few Paris houses that were in operation at the actual outbreak of war were promptly closed, partly as a similarly precautionary measure to that which more briefly darkened those in London, partly because so many of the men concerned were required for the army. And thus the situation remained until, in October, the Comédie Française inaugurated a schedule of four performances a week.

In Berlin, oddly enough, despite war conditions, blackouts, and the like, dramatic activity proceeded normally, or even better, though under circumstances that called for frequent, and in some cases almost daily, changes of bill. An exception to this rule was found, however, in Heinz Coubier's comedy, *Aimée*, which, with Olga Tschechowa in the title part, passed its 200th

showing in October. A new drama by Gerhard Hauptmann on a mediaeval subject, *The Daughter of the Cathedral*, met an enthusiastic reception, and, later, there was much expectancy from an historical work by Curt Langenbeck written around the personality of Jacob Leisler, a German hero of 1691 in old New York. *High Treason* was the title. Gustaf Gruendgens appeared in productions of Shakespeare's *Hamlet* and *King Richard II.* Other outstanding offerings were a comedy by Lope de Vega, *The Knight of the Miracle*, adapted into German by Hans Schlegel, Fritz Schwieler's *The Great Comedian*, and a piece entitled *Lucky Candidate*, by Hans Mueller-Schloesser, presented with the popular radio star, Ludwig Manfred Lommel, in its leading role.

The Scandinavian countries, year by year, evince a growing love of drama both native and cosmopolitan, substantial as well as ephemeral. Sweden, particularly Stockholm, experienced an especially active season. From France came, as also to London, a translation of Alfred Gheri's comedy of Montmartre tenement life, *Sixième Etage*, scoring a success, as it had done in Paris the preceding year; and from Copenhagen Kaj Munk's play on the topic of dictators, *He Sits in a Crucible*, with every evidence of duplicating its home popularity. There was a gay, novel revue by Alf Henriksen, and in the Spring Selma Lagerlof's beloved and moving *Dunungen*, now accepted as a native classic, was presented in celebration of her 80th birthday, as had previously been done on her 70th. Signe Hasso portrayed the title part. June witnessed the climax of the season in Vilhelm Moberg's *Kyskhed (Chastity)*, a subtle modern work written in reaction against European pessimism, and introduced by an impressive prologue of the temptation of St. Anthony. Olof Widgren distinguished himself by brilliant performances as both saint and hero. Then followed the usual revivals of Strindberg dramas; likewise a humorous piece by Sigge Fischer, *Suitor from Kisa*, and two more from Denmark—*The Victor*, by Munk, and an entertaining item by Svend Rindom, *Pricken*, played by the popular comedian, Elof Ahrle. September brought a gay satirical revue, *Tattar-Adel (Bohemian and Noble)* by Kar de Mumma, along with several other popular musicals of minor importance, and another feature of the Fall season was a translation, as *Golden Wedding*, of Dodie Smith's charming British *Dear Octopus*, which was warmly welcomed.

Conspicuous among the offerings of the Oslo stage, meanwhile, were a sincere and uncommonly moving work entitled *Mens vi venter (While We Wait)* by the brilliant young native Norwegian journalist, Johan Borgen, a skilfully original handling of the Pirandello type of theme; Per Aabel's pleasing *Forandring fryder?*, and John Knittels' *Via mala*, from the Swiss, a combination of mystery and folk drama. And in Copenhagen a tendency was visible for the newer dramas to reflect contemporary life in the Danish capital. The outstanding example was Ejnar Howalt's *Jeg skal ha' et Barn (I Shall Have a Child)*, a clever, witty problem comedy designed for the Bohemian element, with its principal role taken by Tove Grundjoan. A more serious work was Kjeld Abell's *Anna Sophie Hedvig*, and a pronounced success of American origin was a Danish version of Maxwell Anderson's fantastic *High Tor*.

DUKE UNIVERSITY. An institution of higher education in Durham, N. C., which, having its origin as York Academy in 1838, was expanded in 1858 into Trinity College and in 1924, through the benefactions from James B. Duke, into Duke University. The enrollment for the autumn of 1939 was 3536. The 1939 summer school enrollment was 2608. The regular faculty numbered 424. The endowment funds amounted to over \$34,000,000, while the income for fiscal year ended June 30, 1938 was \$3,437,702. The library contained 570,000 volumes. President, William Preston Few, Ph.D., LL.D., Litt.D.

DUNKERS. See BRETHERN, CHURCH OF THE.

DUST STORMS. In 1939 these were not so widespread or destructive as in several recent years, though occasional storms were, locally, as severe as any experienced since 1930, when the great drought of that year caused widespread dust-blowing. Neither were the dust storms of this year as numerous as in recent years. The dust storms of this year were confined to the States in, and immediately to the east of, the Rocky Mountains and were most prevalent in May and June.

DUVEEN OF MILBANK, BARON, JOSEPH DUVEEN. A British art dealer, died in London, May 25, 1939. Born in Hull, Oct. 14, 1869, he was educated at Brighton College, and in 1887 entered the firm of Duveen Brothers, founded by his father. Subsequently he became senior partner and was instrumental in the great expansion of the business. It was not until after the World War that he became really famous in his field—when, in 1922, he purchased Gainsborough's "The Blue Boy" for the late Henry E. Huntington. The highest price he was supposed to have paid for a work of art was \$875,000 for Raphael's "Madonna and Child" in 1928. In addition to his duties as head of Duveen Brothers, he was frequently called upon as an art expert.

His donations to the world of art were many and included several galleries for modern works and one for works by Sargent to the Tate Gallery in 1936, and in 1937 a new gallery to house sculpture. In 1932 he presented a gallery for Italian primitives to the National Gallery, and donated a new building to the National Portrait Gallery in 1933. Also, he endowed a chair for the History of Art at London University and gave several works of art to museums, notably the "Graham Children," by William Hogarth, to the National Gallery.

A trustee of the National Gallery (1929-36), of the Wallace Collection after 1925, of the National Portrait Gallery after 1933, and of the Museum of Modern Art, New York after 1934 he founded the British Artists Exhibitions Or-

ganization for the encouragement of lesser known artists. He was honored by several foreign countries, received the gold medal of the Royal Society of British Sculptors, and was raised to the peerage in 1933. During the Spanish Civil War he was active in the movement to remove Spanish art treasures from that country for safe keeping.

DYSON, SIR FRANK WATSON. A British astronomer, died at sea on a voyage to South Africa, May 25, 1939. Born at Ashby, England, Jan. 8, 1868, he was educated at Trinity College, Cambridge, and in 1899 became secretary to the Royal Astronomical Society, serving until 1905. He was chief assistant at the Royal Observatory, Greenwich, from 1894 to 1905, astronomer royal of Scotland, 1905-10, and astronomer-royal and director of the Greenwich Observatory from 1910 to 1933 when he retired.

The "official timekeeper for the entire world," and the man chiefly responsible for the development of the Observatory, Dyson became a fellow of the Royal Society in 1901, the recipient of the royal medal in 1921, was knighted in 1915, and served as president of the International Astronomic Union (1929-32). He verified Einstein's theory of the effect of gravitation on light during the eclipse of 1919. After 1928 he made available to the world the exact time by broadcasting the magnified sound of one of the Greenwich clocks.

A frequent contributor to the scientific press, he wrote *Determination of Wave Lengths from Spectra Obtained at the Total Solar Eclipses of 1900, 1901, and 1905* (1906), *Astronomy, A Handy Manual for Students and Others* (1912), and, with R. Woolley, *Eclipses of the Sun and Moon* (1937).

EARLE, REAR ADMIRAL RALPH, U.S.N., RET. An American naval officer, died in Worcester, Mass., Feb. 13, 1939, where he was born, May 3, 1874. Graduating from the U.S. Naval Academy in 1896, he saw service during the Spanish-American War, served on various naval vessels, and in 1905 became inspector of powder for the East Coast. Two years later he served on the *Maine* and in 1908 on the *Galveston*. During 1908-10 he served in the Philippines and then was assigned to the Naval Academy, returning to sea service on the *Iowa* in 1911. Again assigned to the Naval Academy, he was head of the discipline department (1911-13) and of the English department (Aug.-Sept., 1912) and was a member of a special board on naval ordnance (1912-13). During 1913-15 he was on sea duty, and then was again assigned to the Naval Department as head of the department of ordnance and gunnery (1915-16), and of the English department (June-Aug., 1916).

On Dec. 23, 1916, Earle was appointed chief of the Bureau of Ordnance of the Navy Department with the rank of rear admiral, and in 1919 he was given command of the U.S.S. *Connecticut*, with the rank of captain. He was chief of staff of the control force on the U.S.S. *Florida*, 1921-22, and attended the Naval War College in 1922-23. Thereafter he commanded the Naval Torpedo Station at Newport, R. I., until 1925 when he retired to accept the presidency of Worcester Polytechnic Institute. He was advanced to rear admiral on the retired list in 1930.

An authority on ordnance, Admiral Earle contributed to the *Proceedings* of the Naval Institute and wrote *Life at the Naval Academy* (1917) and *Practical Interior Ballistics* (1917).

EARTH DAMS. See DAMS.

EARTHQUAKES. Estimates as to the actual number of earthquakes which are felt in some part of the world each year differ widely, partly because seismological observatories are not regularly distributed over the earth's surface. Sieberg has estimated that 9000 earthquakes take place each year, and his estimate is considered reliable by many seismologists. Fortunately, the vast majority of quakes are either feeble and harmless or else occur under the sea or in thinly populated regions. According to Peterschmitt, of the Bureau Central Seismologique de Strasbourg, during the four-month period of March to June, 1939, there were 504 earthquakes felt by people or registered by seismographs. Of these probably about one-fourth were of sufficient strength to have the epicenter determined accurately either by isoseismal lines or from instrumental recordings. If Peterschmitt's reports are representative, they mean that in an average year there are somewhat less than 400 earthquakes strong enough to have determinable epicenters, and this figure agrees well with other estimates. It is also difficult to determine the mean annual loss of life caused by earthquakes. Some years ago Davidson estimated that in an average year 14,000 persons are killed by earthquakes; a couple of years later he revised his estimate and reckoned that the average number of lives lost each year in the earthquakes of the whole world is about 28,000. Heavy quakes often occur in remote regions and are known to have happened only from the records made by seismographs over the globe; even from some populated regions direct news is sometimes weeks or months in reaching the rest of the world. In the United States alone more than 200 earthquakes are usually reported annually.

In destructive earthquakes reports of the loss of life are never wholly accurate; there were two such earthquakes in 1939, the loss of life being very great in each. These were the earthquakes in Chile in January and in Turkey in December. It can be stated with definiteness that the loss of life by earthquakes in 1939 was greater than for any year since 1935. Possibly, the loss of life in 1939 was greater than in any year since 1923 when the great Japanese earthquake occurred.

Chile. About midnight, local time, of January 24-25 an earthquake took place in Chile. The epicenter was very near Chillán, a town of about 45,000 inhabitants and 40 miles northeast of Concepción. The shock was so strong that it was recorded on seismographs throughout the world; at the observatories at La Plata and Buenos Aires the needles of the seismographs went off the drums. The descriptions of persons surviving the earthquake emphasize the severity of it. Some people had experienced other earthquakes, such as that of Valparaíso in 1906, and were able to compare the severity of the two, and all agreed that the 1939 earthquake was extremely severe and that the initial shock was vertical. Estimates of the duration of the initial shock varied from one to three minutes. The belief was that the earthquake was very violent and that the Chileans had never experienced another of equal intensity.

Chile is one of the great seismically active regions in the world and part of the circum-Pacific ring of instability. The city of Concepción has had an unfortunate history seismically, having been severely damaged on no fewer than six occasions prior to 1939. These were 1570, 1657, 1730, 1751, 1835, and 1898.

The 1939 earthquake was not only severe, but very extensive also. It was felt from Valparaíso in the north to Puerto Montt in the south; the area where it was felt being estimated at 300,000 square miles. The isoseismal line of 9 (Modified Mercalli Scale) extended from north of Talca to south of Los Angeles, a distance of about 200 miles along its major axis, and in both of these cities large scale damage was done. The isoseismal line of 10 included the cities of Parral, San Carlos, Chillán, and Concepción.

Naturally the damage to property was great. Chillán suffered the most, and next to it, Concepción. At Chillán, two walls of the massive cathedral, the post office and telegraph building, the infantry barracks, two theaters, and most of the dwelling houses collapsed immediately. The initial shock cut off the supply of electric power and water. At Concepción, the fourth largest city in Chile, situated near the mouth of the Bio-Bio River and with a population of 89,000, three-fifths of the city was left in ruins and many famous buildings, including the Teatro Campo Club and the hospital, were destroyed.

By good fortune, in all this destruction no sea wave at Concepción accompanied the earthquake. In this respect the 1939 earthquake was similar to the 1898 one. The other five earthquakes at Concepción were all accompanied by sea waves, that of 1835 having a sea wave 28 feet high.

Following the initial shock, aftershocks were frequent and in some cases of considerable severity. There were severe disturbances on the nights of January 27 and 28. On January 30 a severe shock with the same epicenter occurred and completely demolished the few remaining buildings at Chillán.

Altogether, approximately 25,000 people were killed, 50,000 injured, and 100,000 made homeless by the Chilean earthquake of 1939. See CHILE under *History*.

Turkey. On the night of December 26-27, between 1:57 a.m. and 5 a.m. local time of the 27th, an unusually severe earthquake took place in Turkey. The epicenter was about 75 miles south of the Black Sea coast and about midway between the cities of Sivas and Erzinjan. This latter city, a prosperous trading center dealing in silk, cotton, and copper, is at an altitude of 4000 feet above sea level with a population of 15,000. The severity of this earthquake is forcefully brought out by the fact that about 80 per cent of people of this city were killed. This shock was certainly world-shaking, so far as modern seismographs are concerned, for it was registered throughout the world. The seismograph at West Bromwich in England, at a distance of about 2500 miles from the epicenter, was damaged by the quake.

The whole of Asia Minor is a seismically active zone. Prior to the present shock earthquakes appeared to be growing in intensity and frequency. In 1784, Erzinjan was devastated by a severe earthquake, though that shock was not so severe as this latest one. Indeed, the present earthquake appears to be the most severe that Turkey has ever suffered.

The area covered by the quake was large. The isoseismal line of 7 (scale 7 indicates that damage has been negligible to buildings of good design and construction, but considerable in poorly built structures) extended from Ankara in the west nearly to Mt. Ararat in the east, and the isoseismal line of 9 (Modified Mercalli Scale) extended from Boghaz-Köi in the west to Toprak-Kale in

the east, a distance of about 450 miles along its major axis. The isoseismal line of 10 included the cities of Yozgat, Sivas, Tokat, Amasya, Samsun, Giresun, Malatya, Erzinjan, Erzurum, Gumushane, Pülümür, and Ordu. The devastated area covered about 15,000 square miles, but the isoseismal line of 10 includes an area greater than this. The area where this earthquake was felt by people probably exceeded 180,000 square miles. Though this is less than the corresponding figure for the Chilean earthquake in January, the isoseismal line of 10 includes an area considerably greater than for the Chilean earthquake.

The damage to property was immense. Sivas, a city of about 50,000 people, the center of caravan routes and a collecting place for the agricultural produce of the surrounding districts, and Tokat, a city of about 30,000 people with a thriving cotton manufacturing industry, as well as the villages situated between these cities, were practically wholly destroyed. The cities of Yozgat and Amasya, somewhat further removed from the epicenter, were both left in ruins. At Samsun, a seaport on the Black Sea with a population of 15,000 and with a thriving export trade, schools, and other public buildings—many of them built of reinforced concrete—as well as private houses, were destroyed. All other villages and cities situated within the isoseismal line of 10 suffered similarly. The upsetting of oil lamps and stoves and the breaking of gas pipes caused many fires to break out in the cities affected, which the few surviving fire brigades could not extinguish on account of broken pipe lines and huge cracks in the roads and streets. Telephone and telegraph communications were also disrupted.

Most of the geological faults already known in the area have shifted, causing large crevices and permanent lateral movement. One of the principal faults along which movement took place was estimated to be 16 miles deep, and many new faults were formed. In the mountainous district between Amasya and Tokat there were ground fissures 12 yards wide, out of which issued smoke and sulphur fumes and jets of boiling water.

News of some 500 villages to the east of Erzinjan was still incomplete at the end of the year. The total deaths were estimated at 45,000 people, the injured 20,000, and about 2,000,000 people were left homeless. Great as the estimated number of deaths was, it seems small in view of the reliable reports of the earthquake's severity. It is extremely rare for a shock to have intensity 12 (12 being a shock where damage is total, waves being seen on ground surfaces, and objects thrown upward into the air), and the isoseismal line of 12 for this earthquake embraced a considerable area. Moreover, the earthquake took place at night when most of the inhabitants were asleep, and it is known that many people, in bed at the time of the first shock, were buried alive in the wreckage of their homes. Also the single-storied mud houses of the peasants were easily destroyed. Finally, the meteorological conditions following the earthquake were bad; heavy rains and snows caused floods, and these were followed by a severe cold wave on December 28.

Other Shocks. Other earthquakes, fortunately of much less intensity but nevertheless worthy of mention, occurred during the year. On January 6, an earthquake of considerable intensity shook Quetta, in Baluchistan. No damage or casualties were reported, and this shock owes its interest to the fact that a very destructive earthquake shook

Quetta in 1935, and the buildings of new Quetta are of reinforced concrete and brick, attention having been paid to earthquake-proof design. The new buildings withstood this earthquake very well.

The entire village of Aikawa, Japan, disappeared into the sea when coastlines from Cape Nyodo to Lagoon Hachiro crumbled as the result of an earthquake on May 1. About 1000 homes were destroyed. On June 22, there was an earthquake in the Gold Coast Colony, Africa, in which 17 people were killed. An earthquake of considerable intensity shook the district around Smyrna, Turkey, on September 22. The villages of Pergame, Kotchile, and Fotcha were very hard hit, and about 200 people were killed and 5000 left homeless. On September 27 there were 18 earthquakes within 24 hours, all strong enough to be felt by people at Ankara, Turkey. There was some damage, but no loss of life.

On November 15 an earthquake was registered on the seismograms at the observatories of Weston, Georgetown, Ottawa, Pittsburgh, Fordham, Williamstown, and Philadelphia. The epicenter of this shock was computed to have been near Latitude 40° N, Longitude 75° W, being south of Philadelphia and east of Wilmington, with a depth of focus of about 16 miles below the earth's surface. The interest of this earthquake lies in the fact that it reached intensity IV on the Rossi-Forel Scale in a well-populated district, yet caused no damage. It is very unusual to have an earthquake so strong as this one in this region.

There was an earthquake in Turkey on November 23, when an intense shock caused much property damage and killed 43 people in Anatolia. On December 21, San José, Costa Rica, experienced the most severe earthquake it had known since 1923, but no casualties were reported. See SEISMOLOGY.

RICHMOND T. ZOCH.

EAST PRUSSIA. A province of Prussia, Germany. Area, 15,061 square miles; population (June 16, 1933), 2,333,301. Capital, Königsberg (335,000 inhabitants in 1937).

ECOLOGY. See BOTANY.

ECONOMIC ASSOCIATION, AMERICAN. An organization founded at Saratoga, N. Y., in 1885, to encourage economic research, especially the historical and statistical study of the actual conditions of industrial life, to issue publications on economic subjects, and to encourage perfect freedom of thought and discussion upon current problems from an economic point of view. The membership in 1939 totaled approximately 3000, plus 1400 subscribers (libraries, etc.). The annual meeting of the association was held in Philadelphia, Pa., Dec. 27-29, 1939. Among the topics discussed were: "Objectives of Monetary Policy," "Economic Issues in Social Security Policy," "Behavior of Bank Deposits in the Business Cycle," "Problems in the Teaching of Economics," "Price Control under 'Fair Trade' Legislation," "American Commercial Policy," "The Transportation Problem," "Preserving Competition versus Regulating Monopoly," "Theory of International Trade," "Collective Bargaining and Job Security," "Banking Reform through Supervisory Standards," "Incidence of Taxation," "Economic Planning," and "Economics of War." The officers in 1939: President, Jacob Viner, University of Chicago; vice presidents, John H. Williams, Harvard University, and Paul H.

Douglas, University of Chicago; counsel, John E. Walker, Washington, D. C.; and secretary and treasurer, James Washington Bell, Northwestern University.

ECONOMICS. See BUSINESS REVIEW; CO-OPERATIVES; FINANCIAL REVIEW; LITERATURE, ENGLISH AND AMERICAN; LABOR CONDITIONS; LIVING COSTS AND STANDARDS; PLANNING, ETC.

ECUADOR. A South American republic. Capital, Quito.

Area and Population. Ecuador's boundary dispute with Peru remains unsettled. The area claimed by Ecuador is officially estimated at 276,007 square miles, including the Galapagos Islands (2868 square miles). Estimated population on Dec. 31, 1937, 3,000,000 (about 10 per cent whites, 39 per cent Indians, 41 per cent mixed, and 10 per cent Negroes and Orientals). Living births in 1938 numbered about 113,345; deaths, 56,231. Estimated populations of the chief cities in 1937 were: Guayaquil (chief port), 139,886; Quito, 118,350; Cuenca, 45,497; Riobamba, 23,942.

Defense. The regular army had 701 officers and 6806 men in 1938. Compulsory military service was introduced on a small scale in 1935. There are artillery, aviation, and naval schools. An Italian mission instructs the army. Defense appropriations for 1939 were 29,414,000 sucres.

Education and Religion. The Indian and mixed races are largely illiterate. Enrollment in schools in 1937 was: Primary, 209,649; secondary, 5936; special training colleges, 3552; universities, 1476. Roman Catholicism is the predominant religious faith, but there is no state religion.

Production. Agriculture supports about 90 per cent of the people, but minerals produced by foreign-owned companies accounted for 62,216,000 sucres out of total exports of 169,095,627 sucres in 1938. Exports of cacao in 1937-38 were 18,500 metric tons; of coffee, 10,000 in 1938-39. Bananas, cereals, fruits, vegetables, sugar, and cotton also are grown. The forests yield tagua nuts, rubber, balsa wood, and kapok. Mineral production in 1938 was: Gold, 1370 kilograms; silver, 2.5 metric tons; petroleum, 302,000 metric tons. Straw hats and small quantities of textiles, paper, sole leather, banana flakes, and flour are the chief manufactures.

Foreign Trade. Imports in 1938 totaled 148,314,911 sucres (147,860,226 in 1939); exports, 169,095,627 sucres (164,840,543). The United States supplied 34.6 per cent of the 1938 imports (39.6 in 1937); Germany, 24.1 (24.1); United Kingdom, 7.7 (10.1). Of the exports, the United States took 37.5 per cent in 1938 (33.2 in 1937); Germany, 17.5 (21.9); France, 8 (12.2).

Finance. According to provisional returns, actual budget receipts in 1938 were 120,700,000 sucres and expenditures were 127,300,000. The ordinary budget estimates for 1939 balanced at 130,950,000 sucres; for 1940, 113,050,000 sucres. The foreign debt on June 30, 1939, was reported at \$26,470,000; internal debt on Dec. 31, 1937, 26,830,600 sucres. Exchange value of sucre, \$0.0878 in 1937, \$0.0708 in 1938.

Transportation. Ecuador in 1939 had about 773 miles of railway line in operation and 120 miles under construction. All lines carried 273,913 tons of freight in 1938. Highways extended 3852 miles, but part of them were impassable in wet weather. Four air services covering 554 route miles linked the chief cities. Pan American Grace Airways eliminated Quito as a stop on its

international service in July, 1939, and substituted a feeder service between Quito and Guayaquil. The German-Ecuadorean airline *Sedta* inaugurated a service connecting Cuenca, Salinas, Esmeraldas, and Guayaquil July 29, 1939. A total of 460 vessels entered Guayaquil in 1937.

HISTORY

Political Developments. The chaotic political conditions and economic depression that had characterized Ecuador's history during the preceding decade (see 1938 YEAR BOOK, p. 221 f.) grew worse during 1939. Dr. Aurelio Mosquera Narváez, who was elected Provisional President by the Constituent Assembly on Dec. 2, 1938, had dissolved the Assembly on December 13 and imprisoned some of the leading Leftist members supporting the presidential candidacy of former Provisional President Luis Larrea Alba. On Jan. 4, 1939, he released some of the prisoners and on January 15 Congressional elections were held under the new Constitution adopted by the Constituent Assembly Dec. 1, 1938. The Constitution granted the suffrage to all persons over 18 years of age and the women of Ecuador went to the polls for the first time. Nevertheless the election produced government majorities in both houses of Congress. The defeated Leftist parties charged that the result was due to fraud and other illegal government practices.

Purge of Opposition. When Congress met on February 1, it rejected the new Constitution. President Mosquera Narváez continued in office over Leftist protests despite the agreement made in December that Congress would elect a new President. The government announced that the 1906 Constitution was considered as in effect.

With majority support in Congress, the government proceeded to purge the schools and other public and semi-public institutions of opposition elements. The autonomy of the University of Quito was revoked and some of the professors, branded as Communists by the government, were dismissed. Leftist students struck and barricaded themselves in the university buildings. The strike spread to labor unions and was seized upon by anti-government politicians as a means of overthrowing the government. Late in March President Mosquera Narváez obtained extraordinary powers from Congress to curb this agitation. Troops ousted the university students and when the faculty resigned, the institution was closed for the rest of the term.

The government aroused further opposition by undertaking to revise the advanced labor legislation enacted in preceding years. Charges of misappropriating large sums from the Treasury were made against two former Provisional Presidents—Federico Páez, who fled the country in 1938, and Gen. Alberto Enríquez—and a number of their political associates. Government spokesmen charged that some \$37,500,000 had been illegally diverted from public funds during the Páez and Enríquez dictatorships of 1935-38.

Economic Difficulties. Meanwhile economic conditions were going from bad to worse, despite the partial relaxation on January 6 of the import control regulations that had hampered trade and business during 1938. The exchange value of the currency declined along with budget revenues, government salaries were unpaid, and the rising cost of living provoked unrest among peasants and laborers. High taxes and labor costs led some industries to leave the country. On September 11

the President amended the Labor Code by decree, permitting employers to increase the working week from 40 to 48 hours provided time and a half was paid for the hours over 40. The outbreak of the European war deepened the country's economic difficulties and led to the imposition of drastic price-control measures. The 1940 budget signed November 8 provided for the discharge of many government employees and other curtailments to match declining income.

Death of President. To increase the confusion, President Mosquera Narváez (q.v.) was stricken in his offices on November 14 and died three days later. Dr. Carlos Arroyo del Río, President of the Senate, was named Acting President pending an election set for Jan. 10-11, 1940. He removed restrictions on imports of foreign currency and gold, but the general political uncertainty and the refusal of the banks to advance credit led to virtual economic paralysis late in November. Dr. Arroyo del Río resigned as Acting President December 11 to run for President on the Liberal-Radical ticket. Ex-President José María Velasco Ibarra returned from exile to run against him.

Revolutionary Conspiracies. The above conditions were productive of repeated revolutionary outbreaks by Leftist elements during the year. In January police arrested a number of opposition politicians and announced the collapse of a plot. There were many more arrests during the March strike of university students and workers in Quito. On May 8 former President Larrea Alba and 50 associates, including some army officers, were arrested in connection with another alleged conspiracy. On July 10 a number of Leftist politicians were jailed following the abortive revolt of an infantry battalion in Quito. Elaborate military precautions were taken to prevent workers' demonstrations in connection with the opening of Congress early in August.

Foreign Relations. The negotiations for settlement of Ecuador's boundary dispute with Peru, which broke down in 1938 (see 1938 YEAR BOOK, p. 223), remained suspended throughout 1939. In July and September clashes between small patrols of the two countries in disputed territory threatened to inflame public sentiment, but no dangerous crisis developed. Other American governments were understood to be working behind the scenes to secure resumption of the boundary negotiations.

The Quito Government opened negotiations in the United States for a \$20,000,000 loan to be used for road building, but with no success up to the year end. Reports that the Galapagos Islands would be sold to the United States or offered as security for the loan were officially denied. However it was announced August 24 that the government had authorized United States oil experts to survey the islands for petroleum deposits.

The Foreign Minister on May 2 denied the existence of Nazi or Fascist organizations in Ecuador, although the Liberal newspaper *El Día* charged that Germans in the country were conducting propaganda among Ecuadoreans as well as among their own nationals. The Italian military mission returned home upon the outbreak of the European war, but Col. Ricardi di Belfiore arrived in Quito in mid-November to carry on its work. The Ecuadorean Government had expressed its willingness to receive a United States mission if a suitable "offer" was made. Late in January there were hostile demonstrations by Leftists

against crews of two Italian cruisers which paid a good-will visit to Salinas, Guayaquil, and Quito. An army commission appointed to investigate purchases of arms from Italy by the previous governments reported in July that the material acquired was secondhand and virtually useless.

EDUCATION. Reports from many of the countries of the world give unmistakable evidence of great expansion of the concept of education. Schools are no longer thought of merely as institutions where courses in the language arts, mathematics, and the abstract sciences are taught. They are centers in which national ideals are inculcated in future citizens, where health and ability to work are cultivated, where the skills necessary to economic productivity are developed in youths and also in the adult population. The development of political, social, industrial, and agricultural intelligence is recognized as never before in the history of nations as the function of education.

The far-reaching reforms in the intellectual life of Turkey which were inaugurated after the first World War have gone forward rapidly. A pronouncement by the Republican Party of the People, the only party in the country, contains among others the following statements. "The cornerstone of our cultural policy is the suppression of ignorance. . . . To respect, and make others respect, the Turkish State must be taught as a duty to which everyone must be very sensitive. . . . The method followed in education and instruction is to render learning an instrument in the hands of citizens for guaranteeing success in material life. . . . We are convinced that it is important to treat the students in all institutions in such a way as not to destroy their initiative. On the other hand, it is important to accustom them to serious discipline and order."

From Mexico come reports that the six-year plan to inculcate socialistic ideals is making effective progress. The purpose of this plan as indicated by the official pronouncement is as follows: "The primary school is a social institution and, as such, its teachings and the conditions to be fulfilled by teachers in order to comply with the social function must be those set by the state as the genuine and direct representative of the whole people."

Rumania has recognized the necessity of improving the life in its villages. It has today twenty-six hundred "cultural homes," or organizations of teachers, ministers, state officials, and representatives of the peasantry. These cultural homes are centers for the care of public health, the organization of labor—technical and co-operative—and the improvement of moral and intellectual life.

Italy is in process of a complete reorganization of its educational system. The Grand Council of Fascism issued early in 1939 a charter of the school (*La Carta della Scuola*) which formulated a new educational system. After the manner of Fascism the new system will be worked out in detail by committees of the government and will be put into effect as soon as plans and materials of instruction are ready, probably in the autumn of 1940.

Children are to enter school at four years of age, earlier than under the present system. After two years in a Maternal School they pass into an Elementary School made up of three classes each requiring a year for its completion. At nine years of age a child enters what is called a "School of

Labor." The School of Labor is a substitute for the earlier so-called *corso superiore*, or upper grades of the Elementary School. The curriculum will be more practical, less literary, than it is now.

After the School of Labor there is a Middle School of three years in length. There are branches of this school, known as the Artisan School and the Vocational School, which prepare pupils for employment in specific trades. Other divisions of the Middle School lead into specialized professional schools. The extent to which specialization has been carried is indicated by the fact that there are at the upper, or university, level institutes of agriculture, industry, and teaching; lyceums for classical and scientific study; a Nautical Institute; and an Institute for Geometricians.

This new plan for the schools is supplemented by military training, which begins at the elementary-school level. Military training is the approved form of physical education. It is justified on the double ground that it prepares for service in the army and is more economical than classes in expensive gymnasiums.

The new Italian plan, though somewhat extreme, is in principle typical of the educational programs that are being developed all over Europe. Training for labor is provided by numerous new technical schools in such countries as England and Russia. Apprenticeship with educational training is fully developed in France. Work camps compulsory even for those who are entering the professions have been organized in Germany and in the central European countries that have come under the influence of Germany. In all these countries the care of children's health is made a subject of the most solicitous attention.

A report recently compiled by the League of Nations on the basis of statistics received from many nations shows that very generally educational budgets of 1939 were higher than those of 1938. Even countries which have been backward in providing education for their people are opening new schools. Afghanistan, for example, is organizing elementary education on a far greater scale than ever before in its history.

The expanding concept of education in foreign countries which is evidenced by such facts as have been reviewed is not unfamiliar to the citizens of the United States. For some years past the schools of this country have been taking on new functions—functions of promoting health and safety; functions of vocational training, vocational guidance, and occupational placement; functions of more intensive preparation for citizenship. The expansion of the educational system has been forced on this country in some measure—it may properly be said in very large measure—by the fact that youth has in recent years been steadily excluded from opportunities to enter gainful occupations. There has developed a youth problem with which the United States, in spite of its great expansion of education, does not seem to be able to cope. More emphatically than ever before in the history of this country the care of youth has become a grave national problem.

The Federal Government, which has no direct control of education because the Constitution leaves education to the States, has been obliged to take action with regard to young people who are unemployed. In 1933 the Civilian Conservation Corps (q.v.) was organized to give employment to boys, and in 1935 the National Youth Adminis-

tration (q.v.) was created to provide work for many needy young people not taken care of by the camps set up in 1933 by the Civilian Conservation Corps. Steadily, as the years have passed, the conviction has gained ground that young people cannot be brought together in camps or on work projects merely for the purpose of providing them with jobs. They must always have training which will contribute to their personal and social improvement. The Smith-Hughes Law, which inaugurated in 1917 a national program of vocational education, contains a phrase which is applicable to all efforts which are made in schools and in Federal and social agencies devoted to the upbringing of youths. The Smith-Hughes Law describes the continuation courses for which it provides as designed to improve "the vocational and civic intelligence" of learners.

Though the Federal agencies mentioned were organized outside the school system, they are increasingly finding ways of relating their activities to those of the schools. People are realizing that a young person who is unemployed and seeking work is quite as much a responsibility—indeed, is as serious a liability—of the local community as he is of the country as a whole. Because of the growing realization of this fact, local boards of education are opening school opportunities to enrollees of the Federal agencies. Teachers are becoming convinced that the traditional courses offered in schools are not appropriate for many youths, and they are adapting their instructional materials to the vocational and civic needs of the pupils who come to them. Co-operation of the type which is developing has had two consequences of great importance. First, it has emphasized the necessity of increasing the facilities of the country for inducting young people into adulthood. Education in the traditional sense is not broad enough to meet the needs of young people. There must be provision for a new and enlarged program of care of youth. Second, there is a growing awareness of the fact that the care of youth is a national problem. It is no longer possible for the family to secure opportunities of self-support for its children and no longer possible for a young person to shift for himself. There are indications that the time is ripe for a recanvassing of the means for adjusting young people to present-day conditions.

The Federal agency which in the past has been most directly related to the educational system is the Office of Education (q.v.). Established in 1868, this office was until 1939 a division of the Department of the Interior. It has always had to carry on its functions with meager appropriations. It has operated as a kind of service agency for school teachers and administrators; it has never had any large influence as a national center of leadership for the people of the United States in their thinking about youths and the care of youths. Schools in this country have always been, partly as a result of the limited powers of the U.S. Office of Education, very little in the national consciousness. American education has never had the prominence in political and social policy that the problems of youth have had in the older civilizations of Europe.

Another Federal agency of great importance for the protection and care of young people is the Public Health Service (q.v.). This was located by historical accident in the Treasury Department. Still another agency important to young people is the U.S. Employment Service (q.v.),

which was until 1939 located in the Department of Labor.

When the emergency agencies mentioned earlier were organized at the beginning of the depression to deal with young people, it was evident that the schools, the Public Health Service, and various employment agencies acting separately could not cope with the problems of youth that confronted the nation.

The President of the United States persuaded the Congress in June, 1939, to bring together the Federal agencies that are directly related to the care of young people. They are now united under a single administrative head, the Administrator of the Federal Security Agency (q.v.). The political reorganization thus effected supplies a basis for the more adequate organization of the educational system of the United States. How rapidly a new organization can act will depend on the extent to which this nation realizes, as the nations of Europe have long realized, the importance of properly providing for the health, intelligence, and vocational competency of future citizens.

On the basis of a memorandum of agreement adopted in October, 1939, by the Office of Education and the National Youth Administration, an experimental program has been projected in which enrollees of the National Youth Administration receiving work opportunities and experiences on projects organized by the latter agency are to be taken into schools for related training under the provisions made in the vocational-education law for continuation classes. This memorandum of agreement points out that the traditional literary-mathematical curriculum of the secondary school is preprofessional and therefore appropriate only for a minority of pupils. The vocational courses offered by secondary schools in their regular program are quite as specialized as the traditional courses; they prepare for the higher forms of skill in specific trades and in certain limited branches of agriculture. What is needed in this country is unspecialized education for the great majority of secondary-school pupils. Furthermore, it is essential that provision be made for financial compensation of young people in payment for productive labor if they are to be given the means of establishing themselves at the period in life when they should become independent, self-supporting individuals. In short, what is necessary in this country is a program for the solution of the problems of youth that shall be far broader than the program which has up to this time been included under the concept of education.

In complete accord with the steps described in preceding paragraphs as taken by the Federal Government are measures recommended by the Advisory Committee on Education set up by executive order of the President of the United States. This committee included in its membership representatives of industry, agriculture, labor, and education. It had its origin in the fact that the President was not at all convinced of the wisdom under existing conditions of an appropriation for vocational education made by the Congress in 1937. The committee made extended studies of all phases of education and recommended in the interests of equalization of educational opportunities Federal financial aid to the States, especially to those least competent to support adequate schools. A bill was introduced in Congress in the early months of 1939 based on the recommendations of the Advisory Committee, but

it did not reach the stage of serious consideration. The demand for Federal aid to schools has been presented before by the National Education Association and other educational and welfare organizations. It has frequently been pointed out that certain States, such as those in the southeastern part of the country, have higher percentages of children and lower rates of income than other States and consequently are unable to meet the costs of maintaining schools. Sooner or later the evidence of inadequacy of educational opportunities in many States will undoubtedly secure attention and remedial measures will be adopted.

The movements for broadening the scope of education which are going on in the Federal Government are being reinforced by activities of numerous nongovernmental organizations. The American Youth Commission of the American Council on Education published a pamphlet, entitled "A Program of Action for American Youth," which has received wide attention. This Program of Action calls for employment and publicly provided medical services for every young person. It also advocates changes in the organization of the units of school administration in order to secure greater efficiency.

The Educational Policies Commission of the National Education Association has adopted a program of education for democracy and is aggressively urging school systems to introduce courses dealing with civic and social problems and to organize plans of self-government among pupils which will make them aware of the character and meaning of democratic institutions and democratic modes of life.

Teachers Collège of Columbia University conducted during the past summer a conference on democratic education. To this conference it invited employers and representatives of labor, of welfare organizations, and of education. In small groups around conference tables these individuals drawn from different interests attempted to arrive at agreements with regard to the best methods of teaching and the best contents of instruction which can be employed in order to make young people conscious of the problems of the present era and of the obligations and privileges of citizenship in a nation such as this.

The National Education Association and the Progressive Education Association have organized a joint commission which has as its purpose the preparation of new materials of instruction based on the programs of investigation carried on by State, regional, and national planning bodies. Most of the States have organized boards which make long-term plans with regard to the conservation and utilization of the physical and human resources within their territories. These boards collect information on such topics as water and forest resources, land utilization, community organization, and the population of their areas. Obviously, the information thus brought together and the plans formulated by the planning boards constitute the most stimulating kind of instructional materials for schools. The formal courses in geography and history which have long been taught in the schools, including in the main discussions of lands and peoples far from the homes and opportunities of observation of pupils, will certainly be greatly enlivened by the introduction of instructional materials drawn from the regions surrounding the schools.

The commission organized to promote the study of regional resources and regional planning is to

conduct during the coming summer two centers of research and dissemination of knowledge in parts of the country where extensive studies have been made by planning agencies. One of these centers is in the extreme northwestern part of the United States, one in the southeast. At the University of Washington and at the University of North Carolina groups of teachers and experts on planning will be assembled and will be encouraged to work intensively on methods of gathering and arranging for classroom use the type of information for the collection of which the commission was organized.

A joint commission appointed by the regional standardizing associations of colleges and secondary schools to improve methods of classifying secondary schools brought to completion during 1939 the work on which it has been engaged for the past five years. This commission made a study of secondary schools similar to that made by the North Central Association of Colleges and Secondary Schools of the colleges on its approved list. The purpose of the earlier study and of the present was to find, if possible, a substitute for the rigid standards that had developed within the standardizing association as the means of accepting or rejecting institutions for admission to approved lists. The plan finally adopted at the end of both studies is to compare any given institution in a number of selected characteristics with the average of institutions of its kind. If the institution under consideration falls short in one characteristic but compensates for this particular deficiency by standing well in other characteristics, it may be approved on the basis of its total showing. No fixed and arbitrary adherence to any particular standard is insisted upon, but general conformity to good practice as determined by examination of many institutions is the criterion of approval.

While activities of the type thus far described have been going on in public schools, colleges have been engaged in discussions of their work and have here and there undertaken to broaden their programs. The American Council on Education at its annual meeting in May, 1939, staged a discussion of general education in the course of which criticisms were made of the conventional courses in liberal-arts colleges on the ground that these courses are not suitable for the ordinary student because they are unrelated to modern life and because the methods of instruction and the examination requirements of these courses fail to cultivate powers of independent thinking. A similar discussion took place in November at the meeting of the Middle States Association of Colleges and Secondary Schools. On this latter occasion the president of St. John's College took the opportunity of describing in detail the program adopted by his institution in conformity with the plans suggested by President Robert M. Hutchins of the University of Chicago.

President Hutchins, as is generally known, advocates the reading of one hundred of the greatest books of all ages and all countries. These books, he holds, are the basic materials of general education. In correlation with the reading of the books there is to be discussion of current advances in science and in public policies, and there are to be laboratory and practical exercises designed to cultivate individual skills and initiative on the part of learners.

Perhaps the most discussed article on college and university administration that appeared dur-

ing the year is President Hutchins' article in the *Saturday Evening Post* in which he points out the untenableness of the theory formerly widely held that endowments are the only safeguards of administrative stability in institutions of higher education. The predicament in which endowed colleges and universities find themselves at the present time, when mortgages have depreciated and when interest rates on all kinds of securities have reached an all-time low level, is vividly described in this article, and the case is clearly made that dependence on endowments is no longer a safe policy. Furthermore, as President Hutchins indicates in his article, the probability that there will in the future be large contributions to college and university endowments by rich patrons is diminishing rather than increasing.

The pessimistic view with regard to assured financial stability through endowments is compensated for in some measure by the optimistic outlook for institutions that emphasize high quality of instruction. Only those institutions will be able to survive which can appeal to students as supplying the highest type of educational opportunity.

As one looks to the future it is easy to see the areas in which changes in the educational program of the country are sure to come. Unemployment of young people has been in no small measure covered up for the past thirty years by the fact that free education at the secondary level has been open to all comers. In spite of the growth of the secondary-school population, unemployment of young people has steadily increased. Furthermore, the taxpaying public has organized a vigorous campaign to reduce expenditures for secondary schools, and criticisms are heard from many sources of the curriculums of schools on the ground that they do not prepare graduates for the kinds of careers on which they will certainly have to enter under present social and economic conditions. One cynic remarked that it was a mistake to expand secondary schools because, if they had not been available to absorb the youth of the country, the American people would long ago have been forced to adopt measures for the correction of the intolerable conditions which now confront youth.

The optimistic rather than cynical prophet is likely to foretell an awakening of the secondary schools to the necessity of reorganizing their programs. A study recently made by a committee of the Department of Secondary School Principals of the National Education Association showed that the greatest need which secondary-school principals see is for a new program of instruction for what they call "nonacademic pupils." Nonacademic pupils are a large majority of the six and a half million pupils now enrolled in secondary schools. There can be no doubt that the first and most urgent demand that they have in mind is for jobs and wages that will make them self-supporting. The training which they ask for is such as will make them employable, such as will be of interest to the ordinary boy or girl who is going to be throughout life a semiskilled worker in industry or agriculture. Pupils are quite as critical as older people of the preprofessional education and of the training for unit trades to which secondary schools now devote all their energy. The future will certainly see more attention to general education and to some kind of work program for adolescents.

At the higher level of American education

preparations are now being made to take over the responsibilities for the protection and promotion of scholarship in a world that is largely engaged in the destruction of cultural materials and cultural institutions. Libraries and institutions of higher education are consolidating their resources and planning for a future in which, as seems inevitable, the essentials of civilization will have to be conserved in the Western Hemisphere. The State Department through its Division of Cultural Relations held during the closing months of 1939 a series of conferences in which representatives of all the American republics discussed and arranged plans for concerted action to promote and expand cultural developments on the North and South American continents.

Statistical information is to be found in the articles on SCHOOLS, ELEMENTARY AND SECONDARY; UNIVERSITIES AND COLLEGES; and in the sections on *Education* under the various States and countries. See also PHOTOGRAPHY; PSYCHOLOGY; RADIO PROGRAMS; and the agencies and associations referred to above.

CHARLES H. JUDD.

EDUCATION, AMERICAN COUNCIL ON. A council composed of national educational associations; organizations having related interests; approved universities, colleges, technical schools, state departments of education, and city school systems. It now has more than 475 members.

Since its establishment in 1918, the Council has served as a center of co-operation and co-ordination which devotes itself to scientific inquiry, to the provision of means for consultation, and to stimulation of experimental activities by institutions and organizations. The Council operates through numerous standing committees concerned with various aspects of education and, in addition, has secured financial support from philanthropic foundations for research and service programmes. These include the American Youth Commission which is carrying on an extended study of problems facing young people between the ages of 16 and 25; the Commission on Teacher Education, a co-operative attack on the recruitment, training, selection, and in-service development of teachers; the Co-operative Test Service, which prepares and distributes achievement tests to schools and colleges; the Co-operative Study of General Education, in which 22 colleges have joined for a study of their problems; and the Financial Advisory Service, which consults with institutions of higher education on their financial and business operation. The Council publishes *The Educational Record*, a quarterly journal, various books, and a series of *Studies* growing out of its work.

The operating budget of the Council for 1939-40 is approximately \$106,000 and additional funds for special projects for 1939-40 total approximately \$830,000. George F. Zook is president; C. S. Marsh is vice president; and Mark A. May, Yale University, is chairman for 1939-40. Headquarters are at 744 Jackson Place, Washington, D. C. See EDUCATION.

EDUCATION, OFFICE OF. The U. S. Office of Education is the long-established agency in the United States which represents the Federal Government in educational matters. Its wide range of services are rendered through: Research, field surveys, conferences, work with organizations and committees, advisory services, public addresses, administering educational pro-

grams, financial assistance, demonstrations, information, library services, et cetera.

During the year 1939, through the President's Reorganization Plan, the Office of Education was transferred from the Department of the Interior to the newly created Federal Security Agency. The President's plan also affected the Office by transferring to it the Radio and Motion Picture Divisions of the National Emergency Council.

During the year the Office of Education undertook extensive studies of the organization and functioning of State programs of education. The reports will present a comprehensive view of the ways in which States are organized to provide education for their citizens.

Forum demonstrations were continued during the 1938-39 season in some of the smaller communities of the country. These co-operative demonstration centers, as they were called, each served a number of communities. Federal funds were allocated to the Office for assistance in this work. The co-operative plan sought to demonstrate a practical means by which a forum leader may be shared by several school districts. Since the beginning of the demonstrations more than 500 communities in 40 States have participated in the Federal forum program.

Radio activities of the Office have continued to be emphasized through demonstration and service in educational broadcasting with an attendant interest in radio education by schools and colleges, civic groups and mass audiences generally. Several weekly programs of the Office have been regularly broadcast over the network systems.

The Script Exchange, the "clearing house" for scripts, recordings, production aids and other information has served widely during the year. Upon requests from schools, colleges and other interested noncommercial groups, it distributed during the year 72,000 copies of scripts, bringing the grand total to 250,000 copies since the service was inaugurated. The Exchange has issued a catalog and supplements listing more than 500 available scripts and has assembled a reference library consisting of approximately 2000 scripts.

There was considerable expansion in the Vocational Division during the year. This included the development of Occupational Information and Guidance Service; consultant services in the fields of public service training, employee-employer relations, and curriculum problems. The Business Education Service was established, replacing the former Commercial Education Service. Various advisory committees have been organized to assist in many fields.

More than 10,000 disabled persons were rehabilitated—that is, restored physically where possible, trained where necessary, and placed in remunerative employment—during the year, through services of the Rehabilitation Division. There was particularly marked growth in services for the blind.

Nearly 250,000 enrollees regularly attended organized classes and activities in the CCC camps. This represented 91.5 per cent of the total enrollees. Nearly 8500 illiterate enrollees were taught to read and write. The Office of Education has the general responsibility for developing the educational work in the CCC camps.

In order to show the National status of education, the Office of Education has continued to

collect, compile and publish statistical data in many fields of public and private education. The Office published 70 new bulletins, covering a wide range of research. It issued *School Life*, official journal of the Office; the Annual Educational Directory; and it presented exhibits of educational activities at many national conventions. More than 903,000 copies of publications were distributed during the year. See EDUCATION.

J. W. STUDEBAKER.

EDUCATION ASSOCIATION OF THE UNITED STATES, NATIONAL. An organization of approximately 200,000 persons actively engaged in educational work or interested in the promotion of education. Its purpose is to "advance the interests of the teaching profession, promote the welfare of children, and foster the education of all the people." The Association was organized in Philadelphia in 1857 and incorporated by an act of Congress in 1906. *The Journal of the National Education Association* is the official monthly publication. Various branches of education are represented in the Association by 27 departments. As a continuation of the Horace Mann Centennial celebration, the Association is sponsoring Future Teachers of America, a rapidly growing organization which serves youth in high schools and colleges. See EDUCATION.

A most important activity of the Association is the work of the Educational Policies Commission which has issued the following publications: *The Unique Function of Education in American Democracy* (1937); *The Structure and Administration of Education in American Democracy* (1938); *The Purposes of Education in American Democracy* (1938); *The Effect of Population Changes on American Education* (1938); *A National Organization for Education* (1937); *Social Services and the Schools* (1939).

The seventy-seventh annual convention of the Association was held in San Francisco July 2-6, 1939, around the general theme "Responsibilities of Our Profession." Groups admitted to the Association as departments at San Francisco are: School Garden Association of America, National Association of Journalism Directors, and National Association of Teachers of Speech. The winter convention under the direction of the American Association of School Administrators was held at Cleveland, Ohio, Feb. 25-Mar. 2, 1939. The subject of the yearbook prepared for discussion at this meeting was *Schools in Small Communities*.

The officers of the NEA for 1939-40 are: President, Amy H. Hinrichs, New Orleans, La.; executive secretary, Willard E. Givens, Washington, D. C.; secretary emeritus, J. W. Crabtree, Washington, D. C.; and treasurer, B. F. Stanton, Alliance, Ohio. Headquarters are at 1201 Sixteenth Street, N. W., Washington, D. C.

EDUCATION BY RADIO, NATIONAL COMMITTEE ON. This Committee, appointed by the U.S. Commissioner of Education (see NEW INTERNATIONAL YEAR BOOK for 1934, p. 609), is the official representative of the nine important national educational associations which constitute its membership. It acts as a spokesman in radio for organized education. It assists in protecting the privileges of educational broadcasting stations, promoting broadcasting to schools, and stimulating the improvement of the public broadcasting service.

The Committee's activities include publishing

the periodical—*Education by Radio*. The Committee called a national conference on "The Use of Radio as a Cultural Agency in a Democracy." This conference, held on May 7 and 8, 1934, adopted a set of fundamental principles which are basic to the setting up of a sound system of broadcasting. The Committee has encouraged research in education by radio and has promoted and coordinated experiments in the use of radio, both in school and adult education. It has sent representatives to state, national, and international conferences and has furnished speakers for important national civic groups.

At present the Committee is sponsoring the development of a Public Broadcasting Service. The purpose of this Service is to create a working organization through which educational institutions and agencies, service departments, and citizens' groups can mobilize their broadcasting resources, raise the standards of their presentation, and demonstrate a co-operative method of maintaining working relationships between broadcasting stations and the producers of noncommercial programmes. This can be done on local, regional, or national bases.

The chairman of the Committee is Arthur G. Crane, president, University of Wyoming. The vice-chairman is H. J. Umberger, director, division of extension, Kansas State College of Agriculture and Mechanic Arts. The secretary, who administers the Committee's activities, is S. Howard Evans. The offices of the Committee are located at Room 308, 1 Madison Avenue, New York, N. Y.

EDUCATION FOR DEMOCRACY, CONGRESS ON. See DEMOCRACY.

EGGS. See POULTRY.

EGYPT. A kingdom of northeastern Africa. Capital, Cairo. Ruler in 1939, Farouk I, who succeeded to the throne Apr. 28, 1936.

Area and Population. Excluding the Anglo-Egyptian Sudan (q.v.), Egypt has an area of about 386,000 square miles of which only about 13,600 square miles along the Nile are occupied. The estimated population on June 30, 1938, was 16,129,000. Populations of the chief cities at the 1937 census were: Cairo, 1,307,422; Alexandria, 682,101; Port Said, 126,907; Tanta, 94,421; Mansûra, 68,637; Asyût, 59,925; Damanhûr, 61,791.

National Defense. The Egyptian army (August, 1939) was composed of 32,000 active soldiers and 8000 reserves, fully motorized and equipped with British arms. The seven-year defense program started in 1937 called for an Egyptian first-line army of 50,000 men, with 150,000 in reserve. In 1939 the air force comprised 165 aircraft.

Religion and Education. Of the 1927 population, 91 per cent were Moslems, 8.34 per cent Christians, and 0.45 per cent Jews. Arabic is the official language. About 88 per cent of the adult inhabitants were illiterate in 1927. The school attendance in 1937 was 1,308,252.

Production. Agriculture supports about 62 per cent of the population directly. The area devoted to crops and orchards in 1937-38 was 7,809,000 acres. The yields of the chief cereals in 1939-40 were in metric tons: Wheat, 1,333,800; barley, 238,200; corn, 1,570,700 (1938-39); rough rice, 725,200 (1938-39); sugar cane, 162,100 (1938-39); groundnuts, 15,700 (1938-39); cotton, 380,000 (1938-39); and onions, 1,424,386 bu. (1938-39). Livestock statistics for 1937 showed 983,000 cattle; 956,000 buffaloes; 1,919,000 sheep; 1,311,000 goats; 155,000 camels; and 1,142,000 asses.

Mineral production in 1938 was (metric tons): Phosphate rock, 458,404; petroleum, 225,736; manganese iron ore, 153,112; gold, 2162 fine oz. The fishing industry in 1937 employed 52,002 persons and comprised 10,014 boats. Tourists visiting Egypt in the year ending Mar. 31, 1939, numbered 39,702 of whom 10 per cent were Americans.

Foreign Trade. In 1939 imports for consumption were valued at £E34,091,000 (£E36,934,000 in 1938) and exports of Egyptian products at £E34,081,000 (£E29,342,000 in 1938). Respective value in U.S. currency, 1938 and 1937, was \$184,498,000 (\$192,713,000) and \$147,204,000 (\$200,415,000). Chief imports were cotton, fertilizer, coal, coke, briquets, machinery, and other textiles. See IMPORTS AND EXPORTS.

Finance. For the fiscal year ending Apr. 30, 1940, the budget estimates placed receipts at £E40,247,000 and expenditures at £E41,847,000. For 1938-39 actual receipts amounted to £E37,420,610 and expenditures to £E40,393,341. Actual receipts for 1937-38 were £E37,148,111; expenditures, £E36,332,328. The consolidated public debt was £E87,890,140 on Jan. 31, 1939. The £E5,000,000 debt of the Sudan to Egypt will be refunded at the rate of £E500,000 a year, beginning in 1949, according to a plan approved by the Council of Ministers on May 6, 1939. The agreement provided also for the discontinuance of the annual Egyptian grant-in-aid to the Sudan after the current year. Following the devaluation of the pound sterling in 1931, the Egyptian pound (£E) was pegged at approximately 102½ per cent of the pound sterling and fluctuated in constant ratio with the latter currency.

Transportation. In April, 1938, there were 2763 miles of government-owned railway lines (excluding sidings) and 976 miles of private lines. In 1937-38 the government railways carried 36,769,609 passengers and 1,139,537,571 ton-miles of freight. Gross receipts were £E5,146,934. Highways in 1939 extended 5556 miles; automobiles numbered 31,212. A 140-mile asphalt road across the Sinai Desert from Egypt to Palestine was completed in 1939. Cairo is an important aviation center with airlines radiating to South Africa, Europe, and Asia. During 1938, 9974 vessels of 35,390,325 net registered tons entered Egyptian ports, landing 4,727,893 tons of cargo. See SUEZ CANAL.

Government. The Constitution of Apr. 19, 1923, abrogated on Oct. 22, 1930, was restored on Dec. 12, 1935. It provided for a Parliament of two houses—a Senate with 147 members in 1939, two-fifths nominated by the Crown and three-fifths elected by universal male suffrage, half for five and half for 10 years, and a Chamber of Deputies with 264 members elected for five years. The elections of Mar. 31 and Apr. 2, 1938, for the Chamber of Deputies showed the following results: Liberal Constitutional party, 93; Saadist, 89; Ittehad Esh Shaabi, 19; Wafd, 13; Watani, 3; Independents, 47. Premier at the beginning of 1939, Mohammed Mahmoud Pasha, heading a coalition Liberal Constitutionalist-Saadist cabinet formed June 24, 1938. For changes in 1939, see *History*.

HISTORY

Internal Politics. Premier Mohammed Mahmoud Pasha resigned on Aug. 12, 1939, and a new government was formed on August 18 by Ali Maher Pasha, chief political adviser to King Farouk. Mahmoud Pasha's retirement was attributed mainly to ill health. However he had been under

constant attack by the Wafd (Egyptian Nationalist party), which had lost its long-continued control of the Chamber of Deputies in 1938 (see 1938 YEAR BOOK, p. 226-227). Deprived of its most effective electoral issue by the achievement of Egyptian independence in 1936, the Wafd sought to regain popularity in 1939 by another anti-British campaign. The British were charged with maintaining Mahmoud Pasha in power, violating the Anglo-Egyptian treaty of 1936, involving Egypt in Europe's dissensions, and interfering in the country's domestic affairs. The Wafd party and press also levelled charges of dishonesty against Mahmoud Pasha's government. The Wafd leader, Mustafa Nahas Pasha, was accused early in August of libelling the Minister of Finance, Dr. Ahmed Maher.

The new government formed by Ali Maher Pasha was composed of non-party men and administrative experts with the exception of five Saadists. The Liberal Constitutionalist leaders, whose co-operation was necessary to insure a majority in the Chamber, declined to collaborate without obtaining cabinet representation. Consequently the government faced difficulties in the Chamber when Parliament reconvened. Ali Maher's program called for measures to improve the lot of the fellahen (peasant) and the working classes and for loyal co-operation with Great Britain under the Anglo-Egyptian treaty of alliance. On August 20 he replaced five under-secretaries and two ranking military officials, naming Aziz Pasha el Masry as chief of staff of the army and Hasan Pasha Abdul Wahab as commander of the air force. The Senate on October 17 approved (68 to 59) the government's request for authority to maintain the state of siege established on September 3, thus freeing Premier Ali Maher of parliamentary control.

Relations with Britain. The European crises of the spring of 1939 brought new proofs of Anglo-Egyptian military co-operation. On April 12 movements of British troops from Palestine to the Western Egyptian desert near the Libyan frontier were carried out. On April 24 Premier Mahmoud Pasha stated in Parliament that "our great ally has given us repeated assurances that she will supply us by land, sea, and air with all the reinforcements capable of rendering the co-operation of our two armies as powerful as all the needs for the defense of our country demand. Egypt, on her part, will discharge as well as possible all the obligations imposed by the alliance." The training of the new Egyptian army by a British mission was intensified (see *National Defense*).

Previous to the outbreak of the European War, 7000 additional British troops arrived in Egypt from India. The same day Britain declared war on Germany (September 3), Egypt severed diplomatic relations with the Reich, declared a state of siege, and placed the country on a war footing. All commercial and financial transactions with the German Government or German nationals, including subscriptions to German loans, were prohibited as from that date. German nationals were taken into custody or sent home and German banks and business houses were closed. Premier Ali Maher declared that "the government as well as every Egyptian are heart and soul with Britain in the great struggle for justice and preservation of liberty and freedom. . . . It is in our own interests as in Britain's to resist the policy of force."

War Measures and Conditions. Before war came, the government imposed an income tax and

a stamp tax to provide funds for increasing defense and other expenditures. After September 1 measures were adopted to prevent hoarding and profiteering, regulate food supplies, and censor the press and communications. The government assumed control of foreign exchange transactions except in sterling, prohibited exports of certain commodities, fixed maximum sales prices of necessities and minimum stock exchange prices. These regulations and war conditions adversely affected Egyptian economic conditions during the remainder of the year. The government was obliged to undertake financial support of cotton prices, a task which was aided by the British Government's agreement in November to purchase 242,900 bales of the current cotton crop.

Other Foreign Relations. In May Marshal Italo Balbo, Italian governor of Libya, paid a four-day visit to Cairo. He received a formal welcome, tempered by the statement of the semi-official newspaper *Balagh* that "as long as Italian troops are massed close to the Egyptian border professions of friendship for Egypt will not be taken seriously."

In June the Egyptian Foreign Minister paid an official visit to Turkey, where the question of Egyptian adhesion to the non-aggression pact between Turkey, Iran, Iraq, and Afghanistan was said to have been discussed. On August 21 the government decided to recognize the Soviet Union to facilitate the formation of an anti-aggression bloc in Europe. However the announcement of the Soviet-German non-aggression pact on the following day annulled this plan. Egypt's relations with Iran were strengthened by the marriage of Princess Fawzia, eldest sister of King Farouk, to the Iranian Crown Prince (see IRAN under *History*).

ELECTRICAL ENGINEERS, AMERICAN INSTITUTE OF. A national organization founded in 1884 for the purpose of advancing the theory and practice of electrical engineering and the allied arts and sciences and of maintaining a high professional standing among its members. There are three grades of members: Associate, member, and fellow. The membership on Nov. 1, 1939, was 17,220. In September, 1939, there were 67 sections of the Institute located in various cities throughout the United States and 121 student branches in colleges giving courses in electrical engineering. In addition to district, section, and student branch meetings, there were held an annual winter convention in New York City, Jan. 23-27, 1939, and an annual summer convention in San Francisco, Cal., June 26-30, 1939. Much of the Institute's work is accomplished through its general and technical committees, of which there were 39 in 1939. Its principal publications are the monthly *Electrical Engineering*, the *Standards of the A.I.E.E.*, and the *Year Book*.

The officers elected for 1939-40 were: President, F. M. Farmer; vice presidents, C. T. Sinclair, E. E. George, A. L. Turner, H. W. Hitchcock, J. M. Thomson; directors, Mark Eldredge, R. E. Hellmund, F. J. Meyer; national treasurer, W. I. Slichter; national secretary, H. H. Henline. Five other vice presidents and nine other directors were held over from previous elections. Headquarters are in the Engineering Societies Building, 33 West 39th St., New York City.

ELECTRICAL ILLUMINATION. Perhaps the most significant development of 1939 is the standardized "sealed-beam" headlight unit that is appearing on most 1940 automobiles. This new and effective unit represents three years of co-operative effort on the parts of the automobile industry, the lamp manufacturers, and the American Association of Motor Vehicle Administrators toward the accomplishment of several objectives, including: (1) Safer driving by means of better road lighting, (2) standardization and simplification of parts and of necessary adjustments, (3) universal application and convenient replacement.

Improvements in the new fluorescent lighting described in the 1938 YEAR BOOK include a new white color, a 4-foot lamp unit, improved and simplified auxiliaries, and a rapidly widening variety of fixtures facilitating the use of these lamps for industrial, commercial, and decorative purposes. Some 1800 units installed in a new windowless factory building provide 20 foot-candles of even "daylight" illumination; in another instance 1300 triple-unit luminaires provide 25 foot-candles and have been ingeniously arranged for three-phase operation, thus eliminating any flicker or stroboscopic effect. New germicidal lamps include 3-, 5-, and 15-watt units, the latter being identical with the 15-watt fluorescent lamp except for omission of the fluorescing "phosphor" and the substitution of glass capable of transmitting the ultraviolet radiation of the mercury arc. Germicidal lamps rapidly are finding a wide range of uses for sterilization purposes. A noteworthy application is the use of these lamps in a large meat plant for beef "tenderizing" where they have enabled the period of aging to be reduced from several weeks to a few days. Other developments in mercury lamps include improvements in and commercial and industrial applications of the 1000-watt water-cooled "midget sun" described last year. An adaptation of this capillary type of lamp is a 100-watt mercury lamp highly effective as a "sun lamp." An instrument similar to a photographic exposure meter has been developed to measure ultraviolet radiation.

For both spot and flood use, 300-watt reflector lamps of the same physical size as the 150-watt units mentioned last year have been brought out. A new wire-filled photoflash lamp smaller than a golf ball gives a million-lumen flash, equivalent in brightness to about 40 1000-watt incandescent lamps. A 500-watt photoflood reflector lamp has been brought out. Of nine photoflood lamps for taking color pictures, three are for use with daylight film and six for use with film requiring artificial light.

Improvement in and extension of street and highway lighting continues, with incandescent as well as with sodium luminaires. Falls Street, Niagara Falls, N. Y., with an average of five foot-candles at the pavement, is reported as the current record holder for the United States. New Jersey reports that in its counties where modern highway lighting has been adopted the records show reductions in nighttime motor accidents of 19 per cent, 37 per cent in deaths, 20 per cent in injuries, whereas daytime accidents in the same territory remain about the same. Floodlighting for sports continues, with the major league baseball clubs rapidly going in for night games. Installations completed or arranged for during 1939 include Shibe Park, Philadelphia; Comiskey Park, Chicago; the Cleveland Municipal Stadium, and the Polo Grounds in New York. Illumination

intensities provided range up to 185 foot-candles for infield, 300 for the pitcher's box, and 120 for outfield. The 70-story RCA Building in New York City has been floodlighted. Originally introduced at the 1937 Paris Exposition, the first "Wondersign" made its appearance in the United States, at Times Square in New York City. Comprising some 27,000 vari-colored electric lights and associated control apparatus, and suggestive of a motion picture cartoon, this sign presents an animated printed, written, or drawn display at the rate of 36 different units in a 12-minute period.

The sale of incandescent lamps for 1939 is reported as 540,000,000 large and 430,000,000 miniature lamps, as compared with 485,000,000 and 315,000,000 respectively for 1938 and 515,000,000 and 440,000,000 for 1937. Since 1930 the cost of lamps has gone down nearly 30 per cent and lamp efficiency has been improved by some 18 per cent. The smallest lamp reported is the 0.17-watt "grain of wheat" lamp for surgical purposes—a third of an inch long and weighing 1/7560 lb.; largest, a 50,000-watt lamp 20 inches in diameter and weighing 35 lbs.

G. ROSS HENNINGER.

ELECTRICAL INDUSTRIES. Production in the electrical manufacturing industry as reported for 1939, estimated at about \$2,143,000,000, was some 25 per cent above 1938 and has been exceeded only in 1937 and in 1929. Slow at the beginning of the year and more active during the second half of the year, the general trend was of about the same order as that of general business. Using production for the year 1925 as 100 per cent, statistical reports for 1939 show the Federal Reserve Board general production index for 1939 estimated at 101 as against a final of 82 for 1938; electrical manufacturing production respectively 123 and 97; and employment respectively 89 and 77; population respectively 114 and 113. On the same 1925 basis, some further figures of 1939 estimates and 1938 actuals are: Small appliances respectively 120 and 104, refrigerators 1094 and 769, industrial apparatus 127 and 97, power transmission and distribution equipment 110 and 90, insulated wire and cable 79 and 60, and miscellaneous electrical materials 122 and 83. By the end of 1939 there had been little evidence of any effects in this field from war buying, except perhaps the tendency to increase available stocks of certain raw materials.

Improvements in steel mills and in steel products incidental to further electrification during 1939 are reflected more in the modernization of existing mills than in the erection of new mills. Attention seems to have been concentrated on the finishing stages of steel production, and in particular upon strip mills. Several hot-strip mills built about a decade ago were modernized by adding mill stands, increasing the capacity of driving motors and related equipment, rebuilding run-out tables and other equipment, and by the universal adoption of direct-current mill-type motors arranged for control by means of variable voltage. Every one of the six hot-strip mills built since 1937 has had this latter drive and control equipment. The most conspicuous trend in cold-strip mills, especially those daily turning out miles of "tin plate" (thin continuous steel sheet 3 or 4 ft. wide and used for "tin" cans), is the steady and amazing rise in delivery speed. From about 300 ft. per min. 10 years ago, the output speed of these mills has risen to 1500 ft. per min.

2 years ago, to 2000 ft. per min. in 1939, and to some 2500 ft. per min. for mills now projected or under construction and for which driving motors of from 2500 to 3000 h.p. are expected to be used. Refinements reported include more accurate automatic tension and thickness control; the use of electrostatic cleaners for the cooling air required for large steel mill motors; and the application of an electronic device for the rapid, accurate, and automatic count of steel sheets as they come from the sorting tables. A new direct-connected "drag-generator" (a machine to provide a braking effort for the control of finished strip being passed through a tempering mill) installed during 1939 has bearings and shaft large enough to carry a 12-ton coil of strip and to withstand the cone-thrust of 50 tons at 600 r.p.m. Mercury-arc rectifiers are expected by 1940 to make their entry into steel-mill power-supply service in competition with the traditional motor-generator set. A new slabbing mill makes use of two 5000-h.p. 700-volt motors, each directly connected to roll, thus eliminating gearing; related edging rolls are driven by a 2000-h.p. 700-volt motor and for simplification of control are locatable about 30 ft. from instead of immediately adjacent to the main rolls.

Electric welding is assuming an ever more important place in industry. The articles fabricated by this process literally range from household ornaments to office buildings, from toys to gigantic machines and the stainless steel trains that are revolutionizing American rail transportation. Some of the years' advances will be mentioned briefly. Direct-current arc-welding units of 200 and 300 amperes capacity, powered by 4-cylinder Diesel engines were introduced during the year, the smaller unit weighing some 1200 lb. For these units economic operating advantages are claimed where they will operate 2000 hours or more per year. The increase in the use of alternating current for arc welding during the year has been one of the notable trends. A typical heavy-duty industrial a-c welding installation provides currents ranging from 200 to 4800 amperes. Also, special types of transformers featuring close control and adjustment of current have been announced in 100-, 150-, and 200-ampere capacities. Special equipment announced for resistance welding includes series capacitors for control of power factor, improvement of electronic devices for accurate automatic timing and control of spot- or seam-welds, and improved special equipment for resistance brazing by means of incandescent carbon electrodes held in contact with the work by special tongs. An automatic device combining recording instrument, alarm signal, and lockout control, provides a vital safety check on the adequacy of spot-welds on structures such as aircraft and railroad cars where undetected faulty welding might cause disastrous failures. Portable X-ray equipment for the visual (photographic) examination of welded joints continues to be improved in effectiveness and extended in application.

X-ray equipment continued to be developed and improved for an ever-widening application to medical and industrial uses. A million-volt therapy apparatus was installed in a New York City hospital for the treatment of cancer and allied diseases. Unique design features of this equipment enable necessary compactness and saved some six tons in weight as compared with other designs. Two similar units were under construc-

tion at the year-end. Also included in the installation noted are five 250,000-volt X-ray units for more general use and a portable unit operating at from 60,000 to 140,000 volts that is used for bedside treatments. Smaller portable units are finding wider uses in the hands of doctors, both in their offices and at patients' homes. A new diagnostic photo-X-ray equipment reduces the cost to the patient of this valuable medium in the fight against tuberculosis. Shock-proofing and safety features are being improved. A new electrosurgical instrument having a self-compensating spark gap has been announced. A new device enables up to eight people through the medium of Polaroid glasses simultaneously to view three-dimensional stereoscopic views of broken bones or other internal human parts. Equipment for industrial uses includes (1) improved equipment for X-ray diffraction methods to facilitate precision analyses for research and control purposes, (2) improved portable equipment for photo-inspection of welded joints, (3) a new equipment for visually examining automobile tires to detect flaws or foreign objects without removing the tires from the rims, and (4) equipment for the continuous visual examination of electric power cable simultaneously in two planes as the cable leaves the insulating machines.

For the printing industry a new photoelectric system of color-registry control tried out on a high-speed Gravure press shows great promise of improving the quality of the printed product and reducing expensive spoilage arising from inaccurate registry of successive colors.

Among noteworthy developments in the paper industry are: (1) A simplified electric auxiliary helper drive for equalizing the tension in the upper and lower felts of paper-making machines, thus greatly reducing the likelihood of breakage in the paper sheet during the formative stage; (2) two 500-h.p. electric drives for exceptionally large (194-inch, 2000-ft. per min.) super-calenders designed to operate at nip pressures up to 3000 lb. per lineal inch; (3) a new 214-inch 1500-ft.-per-min. sectional paper machine utilizing 33 motors in its 13 sections and a total of 24 additional motors in the related 6-section dryer; (4) two new pulp grinders establishing a record for size by utilizing 4000-h.p. synchronous motors.

In the textile industry, the further application of electronic control devices includes the automatic correction and removal of bow, as well as skew, from cloth as it passes through one of its finishing stages. Turbine-electric drive, long established elsewhere, was applied to printing in the textile industry during the year to facilitate quick changes in speed by direct push-button control. Other developments include application of direct-current braking to a large loom incidental to individual motor drive, replacing heavy hand-operated clutches by push-button controls.

For rapid and closely controllable localized heating for melting or treating metals, industry is making more and more use of electric energy at frequencies ranging roughly from 1000 or less to 100,000 or more cycles per second.

The petroleum industry has witnessed what is reported as the first installation of carrier-current equipment for the remote control of oil-well pump motors, some 400 of which may be started from the power house from which radiate the electric power lines serving the motors. General developments and refinements in explosion-proof circuit breakers, motors, and control equipment have

kept pace with the industry's ever-growing demands. An electrical device records automatically the strain on pump lift-rods, an important matter with deep wells.

A large meat distributor now is able to "tenderize" beef by hanging it for only two or three days instead of from four to eight weeks as heretofore. A rubber company has announced and demonstrated a new process for electroforming heavy deposits of iron against a plastic or other convenient pattern. Developed for the direct production of a tire mold from a pattern, the process undoubtedly will find many commercial applications. Super-high-speed motion pictures have been used for the visual study of machine parts in operation. An ingenious optical system is being built into a 10,000-kilowatt experimental turbine-generator to enable vibrations in the turbine blades to be studied while the machine is operating under steam pressures up to 1250 lb. per square inch. A special wind-tunnel is being used for efficiency studies of steam-turbine blading. A special camera and necessary related equipment enables pictures to be taken at selected intervals at about $\frac{1}{5000}$ second for the purpose of studying visually the effects of rapidly moving (200 ft. per sec.) fluids on the extinction of electric arcs, and a new camera for similar studies is expected to make pictures at the rate of 120,000 per sec. A tiny electric steam boiler about the size of a radio tube is capable of delivering superheated steam within some 15 seconds. Such are but selected examples of the many products and processes that have come out of the research laboratories where glareless glass, new magnetic and other alloys, new studies of lightning, and countless other subjects are under study.

G. ROSS HENNINGER.

ELECTRICAL MACHINERY. One of the principal features of the year in steam-electric turbine generating equipment is the fact that hydrogen cooling—reported in previous YEAR BOOKS—has become within little more than two years almost a standard practice, especially for machines of 25,000-kilowatt capacity or larger. Well more than a million kw of capacity in such generators was in service by the end of the year. Although there was a notable lull in application of large-capacity high-pressure superposed turbine-generator units during the year as compared to recent years, a 60,000-kw, 3600-r.p.m. superposed turbine-generator was placed in operation during the year, and another was being assembled as the year closed. Also, manufacture was started on what will be the largest such unit, an 81,500-kilovolt-ampere 3600-r.p.m. unit for installation in 1940. Of special significance with respect to 3600-r.p.m. machines is a recently perfected system of semi-flexible mounting for the stators that is expected to reduce greatly both vibration and consequent noise. An interesting job reported during the year was the complete rebuilding of a 160,000-kw cross-compound turbine-generator of foreign manufacture and its conversion into a typical impulse-turbine unit. For all but the larger power stations, there seems to be a trend toward 35,000-kw, 3600-r.p.m. hydrogen-cooled turbine-generator units as something of a standard. A third 110,000-kw vertical-compound turbine-generator unit was placed in service in an automotive plant where the first such unit, installed in 1931, was reported to have had the enviable record of being available for service more than 99½ per

cent of the time during the eight years. Small turbine-generators—up to 7500-kw in capacity—continued a previous trend toward higher steam pressures (1000–1400 lb.) and temperatures (750–900 degrees F.). A total of about 1½ million kw of capacity in steam-electric generating equipment was reported as under construction at the close of the year.

Hydroelectric generators continued to make news during 1939. At Boulder (Hoover) Dam, the 7th and 8th 82,500-kw machines were placed in service and work was started on the next two (ultimate, 15). One of the 1939 machines is reported to have set a new world's record output for a single water-wheel generator—more than 2,000,000 kw-hr in a day, the equivalent of 24-hour operation at nearly 104 per cent of its rated capacity. Next largest units mentioned were four 75,000-kv-a generating units for the new Shasta plant of the U.S. Bureau of Reclamation in California. The first of the three 70,000-kv-a machines previously reported under construction began its journey half-way around the world to Manchoukuo. Also, the 64,000-kv-a unit for the Hiwassee plant of the TVA was installed. The second of three years work was reported on the three 108,000-kw machines for the Government's Grand Coulee Project, and construction was started on four 60,000-kv-a units for the Bonneville project. In short, a total of about a million kw in capacity of hydroelectric generating equipment was reported to be under construction at the close of the year.

Four single-phase autotransformers were installed in Los Angeles to receive power from Boulder Dam at 275,000 volts and deliver it at 138,000 volts. These units are rated at 65,000-kv-a capacity, and have set new records for physical size, each being 37 feet tall to the tops of the bushings and occupying ground space 24 by 12½ ft. Two large 115,000/13,200-volt 3-phase power transformers installed in central New York State have a 50,000-kv-a rating self cooled, and 66,667-kv-a with automatically controlled air-pressure cooling apparatus in operation. Improvements in available materials and refinements in design have notably reduced the physical size of distribution transformers for given ratings. Standardization is being attained in network transformers. A small (0.6-kv-a, 7200/100 volts) low-cost distribution transformer developed for the Government's rural electrification projects in the South in effect is built right in its own porcelain terminal bushing, eliminating the metal tank.

Switchgear developments for 1939 were notable in many ways. A "largest" record was set by the newest circuit breakers built for installation at Boulder (Hoover) Dam powerhouse—impulse-type breakers having an interrupting capacity of 3,500,000 kv-a at 287,000 volts. Because of the relatively small quantity of insulating oil required for these circuit breakers, they have come to be known as one of the "oil-poor" types rapidly gaining favor in the United States. A further development announced during 1939 has been the improvement of completely oilless circuit breakers to accommodate them to the relatively heavier service duties that heretofore have been regarded as the logical field of the customary oil-circuit breaker. Significant, is the announcement of the United States manufacturers that they are ready to build air-blast circuit breakers of interrupting capacities of 1½ million kv-a or more as soon as American utilities want to install them. Trial in-

installations have given encouraging results. Breakers of this general class have for years been used in Europe where the operating duties required of them are much less rigorous than prevalent in the United States with its much greater concentrations of electric power. It is only the recent improvements developed in the United States that have adapted these equipments to successful American use. Improvements in oil-circuit breakers of conventional types in general have increased their interrupting capacities for given sizes. Also, improvements in breakers using in one form or another the magnetic method of expediting arc-extinction have contributed effectively to increases in interrupting capacities for breakers of given physical sizes, for both power-system and industrial applications. "Dead-front" safety metal-enclosed switchboards have been further improved and extended for industrial applications and are penetrating the marine field for shipboard use. Explosion-proof equipment for oil fields, chemical plants, and other hazardous industrial applications continue to reflect important improvements and wider use.

New applications of ground-fault neutralizers ("Petersen Coils") for electric power-transmission lines have brought the total of such protective devices to 38, and set a size-record in the 230,000-volt units built for a third transmission line from Boulder Dam to southern California. A new relay for directional over-current ground protection of electric power lines obviates the expensive instrument transformers normally required for such protective equipment. Another new protective relay simplifies and extends the economic range of the use of pilot-wire systems. "Plug-in" connections, such as recently were adapted for wide use with electric meters, now are being used for protective relays to facilitate quick removal for service or replacement. Another new relay enables quicker and more dependable isolation of a power-station bus in the event of internal troubles. Improvements in equipment are exemplified in the employment of a single carrier-current signal channel for four different functions between a small hydroelectric power station and its related control station at a distant point: (1) telemetering or remote metering, (2) supervisory control of equipment by means of coded impulses, (3) operation of protective relays, and (4) voice communication. Extension in the use of electrostatic capacitors is exemplified by the application of a group of three 450-kv-a 4000-volt units to effect automatic control of line voltage on an electric power distribution circuit. Improved materials have contributed to refinements in and longer life for watt-hour meters and other similar devices. An application indicating the refinements in and growing use of electric gauges for precision measurements and process controls is the use of an electric pressure-gauge to measure the cycles of steam pressure in the cylinder of a locomotive traveling 100 miles per hour.

A new dynamo-electric amplifier—essentially a motor-driven compensated generator having a set of brushes for each set of poles—constitutes an effective industrial control device. It gives a high amplification of direct-current input. Typical applications include service as control-exciter for critical steel-mill, paper-mill, and textile-mill driving motors. The range of sizes of small induction motors using cast rotors and oblique slots has been extended upwards. For the ventilation of the

vehicular tunnel being built in New York City under the East River between Manhattan and Queens, some 46 fans and 82 driving motors have been designed to assure flexibility and a high standard of reliability in service. In a typical combination, a two-speed motor delivers respectively 7 and 50 h.p. for low and medium fan-output, driving the fan through the medium of the shaft of a direct-connected 160-h.p. motor which idles on low speeds but furnishes the power for full-load output of the fan. For Banbury mixers in a rubber mill, large two-speed synchronous motors were built during the year to deliver starting torques of 125 per cent, pull-in torques of 100 per cent, and pull-out torques of 250 per cent. For chemical plants and for oil refineries and pumping stations, completely enclosed self-ventilated explosion-proof motors have been developed for present sizes up to 600-h.p. and future sizes up to 1000-h.p. or more at 3600 r.p.m. These motors have dual-ventilated frame construction, an internal fan to circulate the air sealed in the inner housing, and an external fan to circulate external air through the external cooling ducts. Various developments in motors and control equipment have improved the versatility, capacity, and the quick and precise control of machine tools. New 1000-h.p. 3600-r.p.m. induction motors are operating at some 96 per cent efficiency in driving pumps in a steel plant. Complete use of fiber-glass fabric for insulation in a 10-h.p. motor exhibited at the New York World's Fair enabled it to be accommodated by a 5-h.p. size of frame. This motor is 45 per cent smaller in size and 160 lbs. lighter in weight than a standard 10-h.p. motor with cotton insulation.

First rectifier to be applied to a trunk-line railroad power supply system was the 3000-kw 640-volt ignitron-type unit installed in midyear in New York City by the New York Central Railroad. Such rectifiers, relatively new in the field of electric power supply, continue their ever-widening range of industrial applications. Some 1000-kw, 250-volt units were reported under construction for steel-mill service. For portable service in an Ohio coal mine, a complete 300-kw 275-volt ignitron rectifier substation has been mounted on two mine cars. An 87½-kw 146-volt unit has been applied to underground battery-charging service incidental to construction work on New York City's new Delaware water supply project. Tiny rectifiers of the dry-disc type have been used with great success bridged across the inductive coils of control circuits to reduce or eliminate arcing across relay contacts in such circuits.

G. ROSS HENNINGER.

ELECTRICAL MARINE ENGINEERING. A third turbine-electric tanker similar to the two reported in the 1938 volume was launched during 1939 for operation at high steam pressure and temperature. Several more of the geared direct-current Diesel-electric propulsion equipments, first reported last year, were built during 1939. A new feature of these latter is an arrangement for using the generators as motors for starting the engines, power being supplied by a storage battery. The electromagnetic couplings mentioned last year for geared Diesel marine drives were first applied to cargo vessels in the United States this year, although previously used in Europe. These couplings have two members, both of which

rotate. The driving unit, mechanically connected to the engine, has a squirrel-cage winding similar to that of an induction motor. The driven unit is mechanically connected to the propulsion gears and has a d.-c.-excited field winding. This coupling in addition to serving as a clutch, protects the gears from engine shocks and enables multiple engines to be geared to a common propeller shaft. Units for cargo vessels range up to 4375 h.p. at 180 r.p.m., and operate at 98 per cent efficiency and some 2 per cent slip at full load. The high-speed Diesel-electric propulsion equipment reported last year for four new United States Coast Guard cutters for patrol and ice-breaker service has proved out well in service trials. These equipments adopted the variable-engine-speed variable-voltage control, so effectively used in the new high-speed trains to accommodate varying requirements for propulsion power. The American Institute of Electrical Engineers issued enlarged and completely revised specifications covering Marine electrical equipment and installations.

G. ROSS HENNINGER.

ELECTRICAL TRANSMISSION AND DISTRIBUTION.

More than 5300 miles of new transmission lines were reported as constructed during 1939, compared with 5156 miles in 1938. The outlook for 1940 is for an appreciable increase over these figures. The total in new substation capacity reported as constructed during the year 1939 is more than 2,600,000 kilovolt-amperes as compared with 2,749,000 for 1938; a sharp increase is expected in 1940. Another transmission line from Hoover (Boulder) Dam was placed in service during the summer of 1939, this one to deliver power at 220,000 volts to the system of the Southern California Edison Company, Ltd. For the Los Angeles Bureau of Power and Light, a third 287,500-volt line rated at 150,000-kilowatt capacity has been completed from the Los Angeles terminal about 75 miles to Victorville substation and is scheduled to be completed to Hoover Dam in 1940. First major line from the Government's Bonneville project on the Columbia river is a new 37½-mile 230,000-volt line to Vancouver, Wash., rated at 100,000 kw. Load for this circuit still is largely to be developed, but is expected to come mainly from a new aluminum reduction plant.

Lightning studies continue, and the information so obtained continues to be translated into protective equipment more accurately designed to give specific and effective protection to electrical apparatus. A new and less expensive automatic recording device was announced during the year, an equipment which may be left unattended on such exposed positions as radio towers, tall buildings, etc., to make records of the magnitude and duration of strokes. Thus relatively more records may be obtained for analysis. Artificial lightning now is doing an every-day job in testing certain types of electrical equipment. Also, in the laboratories, it is enabling engineers to duplicate repeatedly the devastating natural strokes that have been recorded by equipment such as that mentioned above and thus learn their characteristics. Improvements in lightning arrester construction include standardized 20-, 25-, 30-, and 37-kilovolt units which may be assembled as required for application to different voltages.

A factory process reported to improve greatly the quality of the lead sheathing on electric power cables was introduced during the year. Among improvements in insulation was the development

of an extrusion process for applying directly to relatively large sized conductors new and effective synthetic materials previously limited to smaller sizes. A new type of mobile power unit for emergency use or for construction jobs comprises a 2000-kw substation, complete with transformer and all related switching and other equipment including forced cooling system, that can be mounted on a chassis with rubber-tired wheels.

G. ROSS HENNINGER.

ELECTRICAL TRANSPORTATION.

A prominent feature of 1939 was the placing in service of a large number of new Diesel-electric high-speed trains on trunk-line railroads of the West and the Middle West and on runs between New York City and Florida points. A Southern railroad has placed in operation several 800-h.p. two-car Diesel-electric trains to furnish rapid air-conditioned local service to counteract bus competition. Considered to be a step in a significant direction is the Burlington's new "General Pershing," each car of which is a complete unit in itself with an individual 220-volt Diesel-engine-driven three-phase generator to furnish the power required for operation of air-conditioning and other electrical equipment. Electric refrigerators are being used in many dining-car kitchens. The novel 5000-h.p. steam-turbine-electric locomotive reported last year was in service operation for several months on the Union Pacific system. The year-end found this locomotive in the shop for certain changes in equipment, and destined for further road service during 1940. The 20 new electric locomotives reported under construction last year by the Pennsylvania Railroad were placed in service in 1939. This road's electrification now includes some 2200 track-miles of line and 200-odd locomotives. During the summer a 450-h.p. Diesel-electric locomotive displaced the old steam locomotive on the Pike's Peak cog-road. Dynamic braking obviates the use of air brakes for the normal down-grade run of this train. The Panama Canal Railroad is replacing its steam locomotives with Diesel-electrics, including some 95-ton 1000-h.p. units geared for operation at 70 miles per hour, but suitable also for switching. Numerous Diesel-electric switching locomotives built for industrial and railroad use during 1939 ranged in size from 150 h.p. to 1500 h.p. A high-speed (4500 r.p.m.) electric motor for small Diesel-electric switchers weighs only about a third as much as a typical 1200-r.p.m. axle-hung motor. Extension of the electrified Paulista Railway (Brazil) from Ityrapina to Bauru required two new 300-kilowatt 3000-volt d.-c. motor-generator substations.

Rapid-transit facilities were improved in many cities during the year. Some 300 more surface cars of the "P.C.C." type (see 1935, 1938 YEAR BOOKS) placed in service during the year brought the total in operation up to some 1100, in 14 cities. Of the 566 trolley-coaches built or under construction, 311 were equipped with compound-wound motors, permitting the advantages of dynamic braking. Some 400-odd Diesel-electric buses were in operation. Extensions to New York City's municipal subway system have required the addition of some 27,000 kw of ignitron-rectifier and synchronous-converter 625-volt power supply equipment to existing substations. See RAPID TRANSIT.

Admiral Byrd's "snow cruiser" is the year's most unusual vehicle. Its power plant consists of

two 150-h.p. Diesel-electric generating sets which serve the four propulsion motors, located one each in the 10-ft. rubber-tired wheels. The 37½-ton vehicle is 55 ft. long, 20 ft. wide, and 15 ft. high, exclusive of the airplane it is fitted to carry. It is designed to operate at 25 miles per hour, and is fitted with living quarters. A novel gear drive for small mining or industrial power-cars or locomotives uses a separate motor for the wheel-groups on each side of the frame, thus eliminating the conventional axles and obviating wheel-slip-page on curves.

At the New York World's Fair the facilities for passenger transportation were phenomenal for a temporary development. Principal feature was the 1568-ft. endless conveyor which carried about 2400 persons per hour at a speed of 102 feet per minute through the "Futurama" exhibit of the General Motors Building. The conveyor train consisted of 23 2-h.p. motor units equally spaced among 299 cars. Each of these cars accommodated two passengers in an upholstered double chair that was fitted with a loud speaker and sound pick-up which delivered to each pair of passengers a synchronized description of the portion of the exhibited before them at any moment. This is the nearest approach so far to the continuous moving sidewalk that has been dreamed of for years by some of those concerned with the problems of mass transportation in congested urban centers. Other indoor transportation facilities at the Fair included 21 electric elevators in addition to 16 electric stairways, having a combined capacity of some 90,000 passengers per hour.

Materials handling is fundamentally a transportation problem, and the year's feature is the 9.6-mile electrically-driven belt conveyor that will transport some 1100 tons of concrete aggregate per hour at a speed of 550 ft. per min. from gravel plant to the construction works at Shasta Dam in California. The conveyor will comprise 26 sections, 23 of which will be driven by 200-h.p. motors and three of which are on a sufficient down-grade to permit them to be used for the generation of power. A new electrically-operated car-dumper in Ohio is designed to handle 45 120-ton cars or 60 90-ton cars per hour.

G. ROSS HENNINGER.

ELECTRIC LIGHT AND POWER.

Throughout the United States the electric power output for 1939 was by substantial margins above that for 1938. For the country as a whole, the electric light and power industry (including both private and municipal utilities) produced 123 billion kilowatt-hours (on the basis of 10 months' record and two months' estimate). This total was hailed by the industry as setting a new all-time high some 13 per cent above 1938 and 36 per cent above the much-discussed 1929. An additional 4.05 billion kw-hr from electrochemical, paper, and other industries and from government hydroelectric plants, plus about 1.27 billion kw-hr from across the Canadian border brought the total power distributed through private and municipal systems during 1939 to more than 129 billion kw-hr. Of this total about 1.7 per cent was required for company use and slightly less than 15 per cent was absorbed in delivering the remaining 83 per cent to individual consumers.

Of the total electric energy generated for electric utility systems during 1939, some 32 per cent was produced by hydroelectric plants and 68 per cent by fuel plants. These figures compare re-

spectively with 38 and 62 per cent for 1938, and reflect the depleting effect of the widespread drought on hydroelectric capacity. In actuality, hydroelectric plants produced during 1939 a smaller total of kw-hr than during 1938, thus thrusting upon fuel plants the burden not only of making up this deficiency, but of absorbing the entire and substantial increase in total power production. (See also POWER PLANTS and TVA.)

Addition of some 900,000 new customers to utility systems during 1939 brings the totals to new high levels and reflects the results of rigorous efforts in the direction of rural electrification. The new total of 28,750,000 customers is classified as follows: farm, 6.2 per cent; residential, 78.8 per cent; commercial-industrial, 15 per cent. Of the approximately 107 billion kw-hr delivered to ultimate consumers during 1939, about 3 per cent to farm customers, 18.5 per cent to residential customers, and 78.5 per cent to commercial-industrial customers. Total energy consumption represented appreciable increases in all these divisions over 1938. 1939 sales of electric energy represented a billed value of \$2,304,000,000, a gain of about 6 per cent for the year as against 13.5 per cent gain in power sales. The gain in sales value for the year was only about half the gain in power sold, reflecting the still-prevalent downward trend in average power rates. During 1939 the average residential consumer used about 890 kw-hr at an average rate of 4.05 cents per kw-hr.

Rate reductions effected during 1939 were exceeded in amount by only one other year in the history of the industry. Total taxes against private electric utilities for the year amounted to some \$345,000,000—15.9 per cent of the gross revenue from electric service.

Preliminary figures indicate capital expenditures of about \$430,500,000 for 1939, divided as follows: \$101,500,000 for steam-electric generating stations; \$17,900,000 for hydroelectric generating plants; \$45,500,000 for transmission lines; \$210,000,000 for distribution lines, \$31,750,000 for substations, and \$22,850,000 for miscellaneous items. The outlook for 1940 is for a much higher budget. The volume of financing during the year amounted to about \$992,347,000, principally for refunding operations, only some \$16,219,000 being new capital.

New capacity in electric generating plants reported for 1939 amounted to 1,284,130 kilowatt, considerably less than in 1938 and much less than is expected for 1940. In steam-electric capacity, 38 private companies reported 3 new plants totalling 155,000 kw and additions to 35 existing plants amounting to 634,450 kw; 19 municipal and other public enterprises reported 3 new plants totalling 40,750 kw, and additions totalling 76,500 kw to 16 existing plants. In hydroelectric capacity, 11 private companies reported 2 new plants totalling 82,500 kw, and additions amounting to 201,200 kw to 10 existing plants. 3 municipalities reported 37,850 kw added to 3 existing plants; the TVA reported 48,600 kw added to one of its plants. In internal-combustion-engine plants, 10 private companies reported additions to 10 plants amounting to 5480 kw; 2 municipalities reported a total of 2500 kw added to 2 plants. Total generating capacity of the electric power industry in the United States at the close of 1939 is estimated as follows: Steam plants, 26,732,000 kw; hydroelectric plants, 9,935,000 kw; internal-combustion plants, 799,000 kw; grand total, 37,466,000 kw. This compares with a grand total of 29,558,000 kw in 1929.

Improvements in operating efficiency in steam-electric generating plants of the United States resulted in the establishment of a new record for low fuel consumption—1.37 lb. of coal-equivalent fuel per kw-hr of output, down from 1.42 for 1938. For the 12 months ending October 31, 1939, the 82 billion kw-hr generated in fuel-burning plants had accounted for the consumption of 44.34 million tons of coal, and of oil and gas the equivalent of another 11.74 million tons of coal. The performance of high-pressure boilers and high-pressure superposed turbine-generator units is considered to have removed these recent developments from the experimental realm and placed them in the realm of established practice.

Federal power projects totalling 1,418,275 kw reported as in operation at the end of 1939 are as follows: (1) TVA—Pickwick, 72,000 kw; Wilson, 184,000 kw; Wheeler, 64,800 kw; Gunter-ville, 72,900 kw; Norris, 100,800 kw. (2) Corps of Engineers—Bonneville, 86,400 kw. (3) Bureau of Reclamation—Hoover (Boulder) Dam, 700,000 kw; Kendrick, 32,400 kw. (4) PWA projects—Platte River, 26,000; Loup River, 45,225 kw; Lower Colorado River, Texas, 33,750 kw. On these projects a total of 488,450 kw was added during 1939, and about that much more is contemplated for 1940.

The Rural Electrification Administration, since its creation in May 1935, has allotted \$267,321,000 of its funds to 687 systems of which 488 have been energized and placed in service; has built some 180,000 miles of line to make electric energy available to some 400,000 rural consumers 224,000 of them added during 1939. (Thus, with the 1,400,000 rural consumers served by private utilities, a total of about 1,800,000 farm customers were receiving electric service at the close of 1939, an increase of nearly 28 per cent for the year.) During 1939, REA allotted \$87,000,000 to 169 projects, as compared with \$180,660,000 and 518 respectively for 1938. Average cost of REA lines is reported to have come down from about \$960 per mile in 1936 to about \$760 in 1939.

The Public Utility Holding Company Act at the close of 1939 was just about where it was at the beginning of the year. After a year of personnel changes and reorganization, the Securities and Exchange Commission was reported to be ready to proceed with its enforcement of the law. Although SEC originally set Dec. 1, 1938 as the tentative deadline for the filing of plans for the integration of power system properties in compliance with Section 11 (b) of the Act, but little action has come of those early filings.

The National Power Policy Committee absorbed the work of the National Defense Power Committee, and the latter was dissolved. The committee has initiated utility meetings in Washington, D. C., promoting the idea of a government-owned superpower "grid" supplied by large steam-electric generating stations located at the sources of fuel. The Federal Power Commission extended its jurisdiction to include a utility system wholly within a state (New Jersey) on the grounds that the system was so interconnected with other utility systems as to form part of an interstate pathway for electric power. The National Association of Railroad and Utility Commissioners took action urging that municipal power systems be subjected to the same degree of public regulation as are private utilities.

Medals. To two prominent members of the American Institute of Electrical Engineers were

awarded high honors for professional attainments. Dr. Gano Dunn of New York City was awarded the Hoover Medal for 1939 for his distinguished public service. The Hoover Medal is awarded from time to time by a joint board representing the American Society of Civil Engineers, American Institute of Mining and Metallurgical Engineers, American Society of Mechanical Engineers, and American Institute of Electrical Engineers. The 1939 Edison Medal of the American Institute of Electrical Engineers was awarded to Philip Torchio of New York City "for distinguished contributions to the art of central-station engineering and for achievement in the production, distribution, and utilization of electric energy."

G. ROSS HENNINGER.

ELECTRONS. See PHYSICS.

ELKS, THE BENEVOLENT AND PROTECTIVE ORDER OF. An organization founded in New York City on Feb. 16, 1868, to promote the practise of Charity, Justice, Brotherly Love, and Fidelity; to increase the welfare and enhance the happiness of its members; to quicken the spirit of American patriotism; and to cultivate good fellowship. Membership in the Order is limited to white male citizens of the United States, not under twenty-one years of age, who believe in the existence of a Supreme Being, who subscribe themselves to its objects, and purposes, and who have been duly initiated in a subordinate lodge.

The supreme legislative body of the whole Order is the Grand Lodge, which is permanently composed of all Past Exalted Rulers who are in good standing in their respective lodges. The Grand Lodge elects all elective national officers of the Order; proposes all amendments to the Constitution, to be ratified or rejected by the subordinate lodges, provides for the institution of subordinate lodges, and enacts all legislation for the administration of the affairs of the Order. The Grand Lodge meets annually.

In addition to the numerous charitable works of the various lodges throughout the country, the Order supports the Elks National Home, established in 1902 at Bedford, Va., for aged and indigent Elks. On July 14, 1926, the Elks National Memorial in Chicago, Ill., was dedicated to the memory of the members of the Order who died during the World War, and in 1928 the Elks National Foundation was established. The Order publishes *The Elks Magazine*.

In 1939 the Order had 1400 lodges with a membership of 500,000. During the year it expended \$1,541,000 in charity.

The officers for 1939 were: Grand Exalted Ruler, Henry C. Warner; Grand Treasurer, R. S. Barrett; and Grand Secretary, J. Edgar Masters. Headquarters of the Order were at Chicago, Ill.

ELLIS, (HENRY) HAVELOCK. A British sociologist and writer, died in Hintlesham, England, July 8, 1939. Born at Croydon, Feb. 2, 1859 he was educated privately. Sent to New South Wales for his health he taught school there during 1875-79, but returning to England he studied medicine at St. Thomas's Hospital and entered practice. Shortly afterward, however, he quit that profession to devote himself to writing. During 1887-89, he edited the *MERMAID SERIES OF OLD DRAMATISTS*, and during 1889-1914, the *CONTEMPORARY SCIENCE SERIES*, to which he contributed *The Criminal* (1890, 4th ed., 1910) and *Man and Woman: A Study of Human Secondary Sexual Characters* (1894, 8th ed., 1934).

Increasingly absorbed in the new science of psychology and biological science, he brought out *Sexual Inversion*, vol. ii of *STUDIES IN THE PSYCHOLOGY OF SEX* in 1897, which was banned in England as a "wicked, bawdy, scandalous, and obscene book." *STUDIES IN PSYCHOLOGY*, an exhaustive study of sexual psychology, normal and abnormal, appeared in seven volumes: *The Evolution of Modesty* (1899; 3d ed., 1910); *Sexual Inversion; Analysis of the Sexual Impulse* (1903; 2d ed., 1913); *Sexual Selection of Man* (1905); *Erotic Symbolism* (1906); *Sex in Relation to Society* (1910); and *Eonism and Other Supplementary Studies* (1928). This monumental work played an important part in bringing about a revolution in the attitude toward sex and its problems. The complete studies were issued in the United States between 1901 and 1928, and in 1936 a popular four-volume edition was published and attained wide circulation.

A prolific writer, other of his works included: *Affirmations* (1897); *The Nineteenth Century: A Dialogue in Utopia* (1900); *Study of British Genius* (1904; 2d ed., 1926); *The World of Dreams* (1911); *The Task of Social Hygiene* (1912); *Impressions and Comments* (1914; 2d Series, 1921; 3d Series, 1924); *The Philosophy of Conflict and Other Essays* (1919); *Little Essays of Love and Virtue* (1922); *Sonnets with Folk Songs from the Spanish* (1925); *More Essays of Love and Virtue* (1931); *Views and Reviews*, 2d Series (1932); *Psychology of Sex: A Manual for Students* (1933); *My Confessional* (1934); *From Rousseau to Proust* (1936); *Questions of Our Day* (1936); *Sex in Relation to Society* (1937; 2d ed., rev.). His *My Life* was published posthumously in November, 1939.

ELMIRA COLLEGE. An institution for the higher education of women in Elmira, N. Y., founded in 1855. The enrollment for the autumn of 1939 was 351. There were 50 members on the faculty. The endowment of the college amounted to \$860,167, and the income for the year, exclusive of gifts, was \$285,911. During the session of 1938-39 gifts amounting to \$4280 were received. There were 48,062 volumes in the library. President, William S. A. Pott, M.A., Ph.D.

EMIGRATION. See IMMIGRATION AND EMIGRATION.

EMORY UNIVERSITY. An institution for higher learning in Atlanta, Ga., coeducational in the graduate and professional schools (except the school of medicine), founded in 1836. The enrollment for the autumn of 1939 was 1640 (including the two Junior Colleges). The 1939 summer session had an attendance of 674. The faculty numbered 328. The endowment amounted to \$5,211,664, and the income for the year was \$807,175. There were 175,086 volumes in the library. The university operates Emory junior colleges at Oxford, Ga., and Valdosta, Ga., duplicating the work of the first two undergraduate years on the Atlanta campus. In 1939 Emory received a grant of \$2,000,000 from the General Education Board of New York and a gift of \$1,000,000 from Samuel C. Dobbs of Atlanta for the purpose of strengthening the College of Arts and Sciences and the Graduate School so that the Ph.D. degree may be offered in certain fields. President, Harvey W. Cox, Ph.D., LL.D.

ENDERBURY ISLAND. An island (3° 7' N. and 171° 3' W.) of the Phoenix group in the Pacific, under joint administration of the United States and Great Britain. The island is 2½ miles long and 1 mile wide. It is valued as a base for transpacific commercial air services. See CANTON ISLAND.

ENDOCRINOLOGY. See BIOLOGICAL CHEMISTRY.

ENGINEERING. See BRIDGES; CANALS; DAMS; ELECTRICAL MACHINERY; FIRE PROTECTION; GARBAGE AND REFUSE DISPOSAL; TUNNELS; ETC.

ENGINEERS, CORPS OF. The Corps of Engineers, U.S. Army, under the direction of the Secretary of War and supervision of the Chief of Engineers is generally charged with investigation and construction of works of improvement of rivers, harbors, and other waterways for navigation and for flood control. Many of the projects intended primarily for one of these two purposes involve features designed for power development, irrigation, pollution abatement, or water conservation. During 1939 approximately 1000 river and harbor projects and 370 flood control projects were in force and active work was prosecuted on 379 of the river and harbor projects and 114 flood control projects. An Act of Congress approved June 28, 1939, appropriated \$96,000,000 for the prosecution of river and harbor works, \$133,000,000 for general flood control projects, and \$39,000,000 for Mississippi River flood control work. This Act also appropriated \$2,000,000 for a power plant at Fort Peck Dam, Montana, and \$7,000,000 for a power plant at Bonneville Dam, Oregon, both of which projects are now being constructed by the Corps of Engineers.

During 1939 the major river and harbor projects under way included the following: Construction of a 40-ft. channel in Boston Harbor; the widening of the 40-ft. channel in Hudson River for the full river width between 59th Street and Ellis Island, and the dredging of a 48-ft. depth over a 1400-ft. width between West 40 and West 54th Streets, New York; the completion of the Miami Harbor Project; the deepening of the Great Lakes-Hudson River waterway to 14 feet; the widening and deepening of Cape Cod Canal; the deepening of the Intracoastal Waterway south of Cape Fear River, N. C., to provide a 12-ft. channel; the improvement of the Sabine-Neches to Corpus Christi reach of the Gulf Intracoastal Waterway.

In addition, material progress was made in the construction of the Tuscaloosa Lock and Dam on the Warrior River, Alabama, to replace existing Locks 10, 11, and 12. Three additional locks and dams on the Upper Mississippi River were completed, leaving only one of the authorized 26 to be finished during 1940. On the west coast enlargement of San Diego Harbor was continued; one of four concrete arch debris dams was completed in the Sacramento River Basin and two others are under construction; extensive work in restoration of channel depths and jetties at Grays Harbor, Washington, was performed, and the widening of the 30-ft. San Joaquin River channel was started.

Flood control construction included activities

on many dams, the more noteworthy being those at Franklin Falls, N. Hamp., in the Merrimack Valley; Knightsville, Mass., on the Westfield River; Arkport and Whitney Point, N. Y., in the Susquehanna Valley; Mahoning, Crooked Creek, Tionesta and Loyalhanna in the Allegheny Valley above Pittsburgh; Wappapello on the St. Francis River, Mo.; Sardis in the Yazoo Valley, Miss.; Great Salt Plains and Fort Supply in the Arkansas River basin; Denison Dam on the Red River, Okla.; Hansen and Prado in the Los Angeles Area, Calif., and Mud Mountain Dam on the Puyallup River, Wash. The Conchas Dam in New Mexico was completed. Local protection works consisting of levees, flood walls, and channel improvements, were under way in the lower Connecticut Valley, in the Susquehanna Valley, New York and Pennsylvania. Channel improvement at Johnstown, Penn., is well advanced. Flood walls and levees were under construction at Ironton, Wellsville, Harrisburg, Huntington, and Paducah in the Ohio Valley and extensive work has been accomplished in the Wabash River Basin, Ind., Los Angeles County, Calif., and the lower Columbia and Willamette Valleys, Ore. and Wash.

JULIAN L. SCHLEY.

ENGINES, INTERNAL COMBUSTION. Diesel engines aggregating over two million horsepower for various applications were built in the United States during 1939. These included 125,000 h.p. for switching and main-line locomotives, 116,000 h.p. for cargo vessels being built by the Maritime Commission, over 500 engines for buses, a considerable number for industrial plants and an increasing number for municipal power plants in sizes from 300 to 2500 h.p. Tractors also accounted for many smaller sized engines but application to trucks is progressing slower than had been anticipated. Several contracts were placed for Diesels in oil pipeline pumping service.

Abroad, Diesel engines have made vast gains in the marine field. For several years past approximately 90 per cent of the ships built in Scandinavian countries and Holland have been Diesel driven, although in Great Britain motorships have comprised less than two-thirds of the vessels built during the same period. Last year over 200 motorships, totaling 1,125,000 tons, were built in European yards and it is reported that 350 motorships, representing 2,250,000 tons, are now under construction. While the greater number of these are cargo boats, more passenger motorships are now building in European yards than steamships. However, the reverse is true in the United States, probably because recent advances in steam practice have rendered the economy of the latest types of steam-driven ships comparable with those propelled by the latest types of Diesel engines.

Outstanding among marine applications is an English ship of 27,000 tons having four Diesels of 8000 h.p. each and a Dutch passenger liner which will be propelled by three 12,500-h.p. Diesels. This is the largest power for a single-acting marine Diesel yet attempted. The double-acting two-stroke-cycle engine is being used in many of the fast cargo boats, but for passenger liners the single-acting two-stroke-cycle type predominates because of its lesser height, which is an important factor in such ships. Waste-heat boilers, utilizing the heat of the exhaust gases for auxiliary steam production, are finding wide ap-

plication in the marine field. See **ELECTRICAL MARINE ENGINEERING.**

Recent progress in the United States has been toward further standardization, especially of component parts, increased speeds, reduced weight per horsepower and improved performance. There has been more extensive use of alloys and welded fabrication, as well as greater precision in manufacturing methods. Other refinements apply to controlled pressure lubrication, fuel injection, scavenging, supercharging, and silencing. Several manufacturers brought out new lines of lightweight high-speed engines during 1939.

For installation in certain localities where both oil and natural gas are available and plentiful, engines adapted to burning either fuel have become popular. Such engines are of two general types, namely, that designed to burn oil or gas on the regular Diesel cycle or that which burns oil on the Diesel cycle and, by changing a few parts, may be operated on the Otto cycle with gas. Outstanding among such engines is a 3200-h.p. unit of the first type now being built for installation in the municipal power plant at Lubbock, Tex., which already has three similar engines, and a 2700-h.p. unit of the second type which was recently installed at Coolidge, Ariz.

In stationary practice the two-stroke-cycle Diesel is more widely used for large units of 1000-h.p. and over, within which range single- and double-acting units appear to be about equally divided. However, large stationary engines operating on the four-stroke cycle are almost invariably of the single-acting type.

While the gas turbine has been under development for many years abroad, only lately has it been perfected by a Swiss Company to the point of justifying commercial application. Thirteen such turbines are now in use, chiefly for driving air compressors in connection with the Houdry oil-refining process, one such installation being in the United States. These are exclusive of small gas turbines as employed for driving superchargers and blowers supplying air under pressure to the furnaces of Velox boilers.

ALFRED D. BLAKE.

ENGLAND. See **GREAT BRITAIN.**

ENGLAND, CHURCH OF. In England, that church which is established and endowed by law as the national church. Its faith is represented in the United States by the Protestant Episcopal Church (q.v.). (For details of church government, see the **NEW INTERNATIONAL YEAR BOOK**, 1932.) In 1937 there were 2,372,079 Easter communicants in the 43 English dioceses. Incumbents numbered 12,645 and assistant curacies, 4527. The total voluntary parochial contributions amounted to £1,219,872.

The war altered for the Church the whole character of a year which for three quarters of its length had promised to be one of quiet and steady consolidation at home and of enterprising advance in new spheres abroad. With the approval of the King, and by an Order of His Majesty's Privy Council, Sunday, Oct. 1, 1939, was appointed to be observed as a Day of National Prayer. A Message on "Christian Citizenship in Time of War" was issued, and the Archbishop of Canterbury on September 1st appealed for "kindly interest and friendship for the evacuated children."

Outstanding among the war problems have been those associated with the vast migrations of

evacuated children; and with the numerous small groups of antiaircraft and other troops necessarily removed by their isolation from the steady influence of Army Chaplains. Soon after the outbreak of war, the Archbishop of Canterbury announced that any clergyman who wished to be appointed as a temporary chaplain in His Majesty's Forces, should make his application to the Bishop of his Diocese, and there was a widespread immediate response. In many places the parochial clergy have been acting as Chaplains for the permanent First Aid Posts which have been set up in preparation for possible air raids.

The postponement was announced of the Lambeth Conference of 1940, which was to have been attended by Anglican Bishops from all the overseas provinces and dioceses, and for which extensive missionary and other preparations were being made throughout the earlier part of 1939.

At the Autumn Session of the Church Assembly a Measure was passed to postpone the election of members of the House of Laity, due to be held in 1940, until such time, up to 1945, as the Archbishops of Canterbury and York may direct. The Clergy National Emergency Precautions Measure, 1939, was passed through all its stages; its object being "to enable the Archbishops of Canterbury and York to make regulations for the more effective exercise of the cure of souls in the event of war, and to enable the Ecclesiastical Commissioners and Queen Anne's Bounty to make financial provision in respect thereof." Various Reports were received including one from the Social and Industrial Commission recommending a revised constitution for that body, which was approved. The subjects of the more outstanding debates of the spring and Summer Sessions included, besides finance and missions, Parochial Endowments; the "First Charges" in the Budget; the Age of Retirement for Bishops and Incumbents; and the Persecution of Christians. The Budget of the Church Assembly for 1940 provides for the expenditure of £145,000. Work was going on all over the country on building schemes assisted by loans from the Central Loan Fund. In the early part of the year much attention was given to new schemes of development for many of the Church Training Colleges, but the outbreak of hostilities interfered with building schemes.

During the year the dioceses made strenuous efforts to complete arrangements for the building of senior schools with the help of Government grants under the 1936 Education Act. So far 24 agreements have been signed by Local Education Authorities for new or re-conditioned Church senior schools.

Important in the field of missionary activity was the publication of "Partners," the seventh Unified Statement of the Work and Needs of the Church Overseas. In it the new relationship between the Church at home and the younger Churches overseas was presented. After the outbreak of the War missionary study in small groups in many parts of the country began to take the place of Missionary Schools and large meetings. During the year the international meeting of missionary representatives of every part of the world at Tambaram, Madras, in December, 1938, greatly influenced missionary thought and co-operation. The meeting in July-August, 1939 at Amsterdam of 1500 young people from all the Churches of the world (except the Roman Catholic Church) was an outstanding event in modern

Christian youth work, as a large number of the non-European representatives came from the younger Churches overseas.

In the sphere of Foreign Relations during 1939 the principal events have been the Union of the Reformed Churches of France, a summary of which was published by the Council and presented in May to the Church Assembly; and the acceptance by the Convocations of Canterbury and York of the agreements reached with the Lutheran Churches of Estonia and Latvia whereby by economy Anglican bishops may take part in the consecration of Estonian and Latvian bishops and Estonians and Latvians unable to receive the ministrations of their own clergy, may resort to the clergy of the Church of England.

The £50,000 Church of England Appeal for Refugees which was authorized by the Church Assembly at the Autumn Session of 1938, met with a generous response resulting in a total of over £65,000. The money is being administered by the Central Board of Finance in conjunction with the Christian Council for Refugees from Germany and Central Europe. On the outbreak of the War the Ecclesiastical Commissioners decided to devote any moneys which would ordinarily have been used for new augmentations, to the making of temporary income-grants to the parochial clergy where such grants might appear to be most needed; and this policy will be followed until further notice. The Governors of Queen Anne's Bounty were engaged throughout the year in the settlement with the Tithe Redemption Commission of amounts of compensation stock transferable to them for the various benefices consequent on the Government extinguishment of tithe rentcharge.

During 1939 the Pensions Board paid out in pensions over £272,700, of which only £100,000 was taken from benefices. Investments (apart from those of the Clergy Pensions Institution) amount to £4,861,000, and despite the War still show an appreciable margin of value over their cost price. Contributions from clergymen towards their retiring or disability pensions total over £186,000. The Board inaugurated the 1939 National Appeal for a fund to augment the small contributory pensions of clergy widows and dependants, and to make pension grants to those unable to benefit under the Widows Measure. Since the War the appeal to the public has been temporarily discontinued. Promises of legacies and collections taken in churches continue to be received. The total received to date is £45,000.

The work of the Central Youth Council during 1939 was concerned primarily with three things—the establishment of Diocesan Youth Councils in every diocese, as far as local circumstances permitted; the World Youth Conference at Amsterdam; and the special conditions arising from the declaration of war in September. There was much evidence of increased activity in the dioceses and news was continually coming in of new Youth Fellowships and other kindred organizations under the direction of the incumbent in a great number of parishes.

Among the appointments of the year were the following: The Right Rev. A. W. Barton, Archbishop of Dublin; The Right Rev. G. F. Fisher, Bishop of London; The Right Rev. D. H. Crick, Bishop of Chester; The Rev. C. M. Chavasse, O. B. E., Bishop of Rochester; The Ven. L. S. Hunter, Bishop of Sheffield; The Rev. G. W. R. Tobias, Bishop of Damaraland; The Right Rev.

E. D. L. Danson, Bishop of Edinburgh; The Very Rev. A. Carlisle, Bishop of Montreal; The Ven. G. P. L. Turner, Bishop of St. Helena; Canon H. D. Martin, Bishop of Saskatchewan; The Right Rev. J. Morgan, Bishop of Llandaff; Canon E. W. Williamson, to be Bishop of Swansea and Brecon.

ENGLISH LITERATURE. See LITERATURE, AMERICAN AND ENGLISH.

ENTOMOLOGY, ECONOMIC. The Bureau of Entomology and Plant Quarantine is concerned with investigations on insects and their economic relations; the development and application of methods for their eradication or control; the carrying out, in co-operation with the States, of necessary work to prevent the spread and to control or eradicate insect pests and plant diseases that have gained more or less limited foothold in the United States; and the utilization of those species that are beneficial. These activities include investigations on and direction of control campaigns against the species injurious to agriculture, horticulture, and arboriculture; investigations on the species affecting the health of man and animals, or infesting human habitations or injurious to industries; the culture and use of honeybees and beekeeping practices; investigations on the natural enemies of insects and plant pests and the possibility of using these as aids for control; the taxonomy, anatomy, physiology, and responses of insects; chemical and other problems relating to the composition, action, and application of insecticides; and the development of methods of manufacturing insecticides and materials used with them.

To aid in carrying out these assignments and to protect agriculture from plant pests and diseases, the Bureau is responsible for the enforcement of the following acts and restrictive orders promulgated thereunder: The Plant Quarantine Act of 1912, as amended; the Insect Pest Act of 1905; the act of 1922 governing the importation of adult honeybees; the act providing for the Mexican border inspection and control service; the act providing for export certification to meet sanitary requirements of foreign countries for plants and plant products; the Terminal Inspection Act of 1915 (in co-operation with the Post Office Department).

Grasshoppers. The late part of the summer of 1938 was marked by unprecedented flights of the lesser migratory grasshopper from western South Dakota into western North Dakota and eastern Montana. Only the most rapid and vigorous action prevented a major disaster to crops in 1939. Grasshopper control was carried on in co-operation with 24 Western States. The infestation was heavy, affecting all States west of the Mississippi River but one, and also the States of Illinois, Michigan, and Wisconsin. During the 1938 campaign approximately 235,000 tons of bait were made available to the States and its application resulted in the saving of over \$176,000,000 worth of crops. Fall surveys indicated heavy concentration of eggs in the Great Plains and Rocky Mountain States, from Texas to Minnesota. In extensive experiments with substitutes for wheat bran or sawdust in grasshopper bait, cottonseed hulls, citrus meal, and chopped alfalfa have given promising results.

Mormon Crickets. In the fall of 1937 more than 18,000,000 acres were found to be infested in the States from North Dakota and Nebraska westward to Nevada, Oregon, and Washington,

about one-third of the entire area being moderately or heavily infested. The control campaign in 1938 was based fundamentally on crop protection. Sodium arsenite dust, metal barriers, and oil-and-water barriers were the most effective methods of control. A total of 230,000 acres was dusted and 1,100,000 lb. of dust was applied. Over 10,000 acres was baited, metal barriers were set up for more than 300 miles, and 75,000 gal. of oil was used on 425 mi. of streams and ditches. A bait containing sodium fluosilicate as a poisoning agent was developed in 1938. Field tests in the spring of 1939 with this material resulted in the destruction of from 78 to 98 per cent of the crickets.

Japanese Beetle. The older areas infested by the Japanese beetle increased in size about 1266 sq. mi. during 1938 and now cover approximately 15,117 sq. mi. Unusually light infestations occurred in the oldest infested area near Philadelphia and a somewhat lighter infestation in much of New Jersey and eastern Pennsylvania north of the Schuylkill River. Extremely heavy infestations occurred in northern Delaware, northeastern Maryland, southeastern Pennsylvania, and in the metropolitan New York area. An investigation on the use of hydrocyanic acid gas as a fumigant for adult Japanese beetles in refrigerator cars was completed and dosage tables worked out for various temperatures. Japanese beetle parasites were liberated at 64 colonies in Maryland, 18 in Connecticut, and 12 in New York. The milky disease now appears to occur rather generally through much of the older heavily infested area. This disease has not been found at points on the outer fringe of this area or in the New England States.

European Corn Borer. A distinct general increase in population of the European corn borer in the region extending from the Great Lakes eastward to Massachusetts and central Connecticut occurred in 1938. As a result of breeding of strains of sweet corn resistant to the corn borer, 93 strains showed apparent resistance. Breeding results with field corn indicated that of 235 strains tested 32 were resistant.

Vetch Bruchid. During the year the vetch bruchid was found to be infesting vetch seed in northwestern Oregon. Heretofore this insect had been known only from the Atlantic coastal States.

Sugarcane Borer. Sugarcane borer caused a loss of \$4,700,000 to sugarcane in 1938. Recent experimental work in the control of this insect by sprays containing cryolite gave approximately 90 per cent control.

Stored-Grain Insects. A study of the condition of farm-stored grain was made in 1938, resulting in the publication of Farmers' Bulletin No. 1811 entitled, "Control of Insects Attacking Grain in Farm Storage."

Fruit Insects. Studies of the influence of particle size have indicated that extreme fineness is not necessary for the maximum effectiveness of lead arsenate, calcium arsenate, cryolite, paris green, or phenothiazine in the control of the codling moth. Phenothiazine continued to give control of the apple maggot in the Hudson River Valley. Thorough application of sulphur materials in the calyx and first-cover sprays resulted in marked reduction in populations of common red spider. Control of pear thrips in Oregon with two applications of a 2 per cent miscible oil emulsion with nicotine sulphate gave a yield of approximately

6 tons of fruit per acre, as compared with less than 1 ton for the unsprayed trees.

Peach Insects. Mass liberation of parasites indicated that early season parasitization can be substantially increased by the liberation of comparatively small numbers of parasites, and the percentage of parasitization of the twig-infesting broods of the oriental fruit moth is directly correlated with the amount of infested fruit later in the season. Field and laboratory experiments with solutions of dichloroethyl ether gave almost complete kill of plum curculio in the soil.

Scale Insects. Investigations in southern California indicated that the strain of red scale that is resistant to hydrocyanic acid gas is not resistant to methyl bromide. Promising results have been obtained in preliminary experiments in fumigations with mixtures of hydrocyanic acid gas and methyl bromide. Sprays that leave a heavy noninsecticidal residue on citrus in Florida resulted in an increase in the populations of purple scale and Florida red scale.

Fruitfly Investigations. Heavy populations of Mexican fruitfly appearing during the last year have been traced to the abnormal production of a second crop of a wild native host abundant in northeastern Mexico. In the Rio Grande Valley of Texas there was an unprecedented crop of fruit and the highest number of fruitfly larval infestations on record, which made sterilization of citrus fruit of prime importance throughout the latter half of the shipping season.

Gypsy Moth. The severe hurricane in the fall of 1938 resulted in spreading gypsy moth eggs to areas heretofore uninfested by this insect. The use of the autogiro in scouting and applying insecticides in gypsy moth work is still in the experimental stages but is giving promising results. The severest and most extensive defoliation that has ever occurred in the area between the barrier zone and the Connecticut River in Vermont, Massachusetts, and Connecticut developed in the summer of 1938.

White-Fringed Beetle. Studies of the white-fringed beetle during the year definitely proved that this insect has but one generation per year. The rate of reproduction is governed by the kind of food plant. The peanut is the most favored food plant yet observed. The maximum number of eggs laid by this insect when feeding on peanuts is over 2400. Calcium arsenate dust on host plants is an effective means of reducing beetle populations. Oil base emulsions as a herbicide are being used successfully to destroy vegetation along railroad rights-of-way, roadsides, abandoned lands, and waste areas, and clean cultivation is proving an efficient control in crop areas. Field observations indicate that the use of these methods during 1938 and 1939 resulted in a drastic reduction in beetle population in all infested areas. On Jan. 15, 1939, a Federal domestic plant quarantine was promulgated to prevent the spread of this pest. State quarantines supplement this Federal quarantine on intrastate movements of host material. No infestation was found in any State in which the beetle had not previously been known to exist. The total infested area in 1939 amounted to approximately 60,000 acres.

Western Pine Beetle. Large tracts of forest land on the east slope in California have been surveyed and zoned as to relative degree of hazard, and it is believed that the danger of serious outbreaks will be greatly reduced by selective cutting of high-risk trees.

Black Hills Beetle. The Black Hills beetle is the most destructive forest insect in the central Rocky Mountain region. The volume of loss caused by this insect during the last five years is seven times as great as the total fire losses and nearly as great as the total volume of timber cut in the States of Wyoming, Utah, and Colorado. In practically all areas where control work has been conducted the heavy epidemics have been reduced to an endemic condition.

European Spruce Sawfly. Four areas of heavy infestation were found in a survey conducted during 1938—two in southern New Hampshire, one in central Vermont, and one in southern Vermont. Colonies of a European parasite of this insect were liberated at every locality in New Hampshire, Vermont, and New York, wherever sufficient larvae were found to make possible successful establishment of the parasite.

Tomato Fruitworm. Experiments during the year demonstrated that cryolite dust mixture containing 70 parts by weight of cryolite and 30 parts of talc gave the best yield of uninjured fruit. No insecticidal material containing substances poisonous to human beings should be applied within three weeks of first picking.

Pea Weevil. In the Pacific Northwest this insect is being successfully controlled by growers, based on research with dust mixtures containing rotenone. In 1937, 47 tons of this material was used. In 1938, 211 tons was used, indicating a decided increase in the use of this material. Large-unit machines are now being used, the largest dusting an 80-foot swath.

Bollweevil. Although the damage caused by the bollweevil in 1938 was almost double that of 1937, it was about 2 per cent below the average for the last 25 years. On experimental plats in the Delta section of northeast Louisiana, used as an index of weevil damage, standard dusting procedure resulted in a gain of 188 lb. of seed cotton per acre as compared to an average of 322 lb. over a period of years.

Pink Bollworm. In the last two or three years the infestation of the pink bollworm in the lower Rio Grande Valley of Texas and across the International Boundary in Mexico has been the cause of considerable concern because of the danger of spread of this pest into and throughout the main Cotton Belt. The efforts to suppress this infestation have attracted considerable attention, the most recent manifestation of which is legislation approved Aug. 9, 1939, authorizing conversations between representatives of the United States and Mexico to consider eradicating or controlling the pink bollworm in both countries by a co-operative programme.

Screwworms. A new insecticide, diphenylamine, has been found to be the most practical, in general, for the control of screwworm on domestic animals. Applications of this material to wounds every third day will prevent them from becoming infested.

Peach Mosaic and Phony Peach Diseases. During the fiscal year 1939 almost 16,000,000 orchard trees on more than 145,000 properties were inspected. In excess of 147,000 diseased trees were found, of which more than 120,000 were destroyed. There is evidence of substantial reductions in incidence of new cases of these two diseases.

Citrus Canker Eradication. Government inspection in Louisiana and Texas resulted in the finding of but one recurring infection and one

infection on a property in which the disease had not previously been detected in Brazoria County, Tex. One hundred six infected trees in these areas consisted of small seedlings. During the year 2,000,000 escaped and abandoned citrus trees were removed and destroyed to eliminate harboring places for this disease.

Dutch Elm Disease. Discovery of considerable numbers of infected trees in several localized sections in New Jersey and Connecticut accounts for the increased number of Dutch elm diseased trees discovered during the year. In 1938, 15,909 diseased trees were found, as compared with 6,500 in 1939. Elms infected with the disease were found in Pennsylvania for the first time during the year, and sporadic infections were discovered in additional towns in Dutchess, Orange, and Ulster Counties, N. Y., outside of the previously known infected zone. Surveys in States remote from the main infected area failed to disclose a single new infection centre.

White-Pine Blister Rust Control. During the calendar year 1938 more than 98,000,000 currant and gooseberry plants were destroyed on white pine forest areas in the United States, totaling 2,234,000 acres. During the calendar year blister rust was found for the first time in 70 counties—6 in the Southern Appalachian States, 60 in the North Central States, 2 in Montana, and 2 in California.

Black Stem Rust Control. During the year barberry bushes, which act as alternate host for this disease, were eradicated in 221 counties in 17 States. This resulted in the removal of 47,445,000 bushes.

Transit Inspection. During the fiscal year 1939 inspectors stationed at parcel post, express, and freight terminal points in 16 cities inspected 1,163,897 shipments for compliance with regulations of Federal domestic plant quarantines. During the same period over 930,000 freight waybills were examined to determine certification status of shipments. Three thousand six hundred twenty-eight shipments consigned in violation of the regulations of Federal domestic plant quarantines were intercepted.

Foreign Plant Quarantines. In connection with extensive experiments to determine the possibility of so treating fruit originating in countries in which fruitflies are known to occur as to insure freedom of the fruit from infestation, studies in Hawaii have resulted in authorizing the movement from Hawaii to the mainland under permit of papayas sterilized by the vapor-heat method. This method of treatment also authorizes the shipment of certain other fruits and vegetables from Hawaii to the mainland under the same conditions.

ESTONIA. A Baltic republic established Feb. 24, 1938. Capital, Tallinn (Reval).

Area and Population. Estonia has an area of 18,359 square miles, including internal lakes, and a population estimated on Jan. 1, 1939, at 1,133,940 (1,126,413 at the 1934 census). The urban population in 1938 was 345,408 (323,007 in 1934). Living births in 1938 numbered 18,450 (16.3 per 1000 inhabitants); deaths, 16,470 (14.5 per 1000); marriages, 9560 (8.4 per 1000). Estimated populations of the chief cities on Jan. 1, 1939, with 1934 census figures in parentheses, were: Tallinn, 144,978 (137,792); Tartu, 60,281 (58,876); Narva, 23,834 (23,512); Pärnu, 21,886 (20,334).

National Defense. Military service is compulsory. The peacetime strength of the army in 1937 was 1320 officers and 9800 men. There was a reserve of 90,000. The air force comprised 68 aircraft. See *History*.

Religion and Education. About five-sixths of the people are Lutherans and the rest chiefly Greek Orthodox and Roman Catholics. At the 1934 census 3.9 per cent of the population 10 years of age and over were illiterate. School attendance in 1937-38 was: Primary, 106,859; grammar, 12,992; high, 3650; universities and other institutions for higher education (excluding military), 4077; professional, 9866.

Production. Agriculture and dairying support nearly 70 per cent of the population. Yields of the chief crops in 1939 were (in metric tons): Wheat, 80,700; barley, 83,200; rye, 204,300; oats, 151,000; potatoes, 997,600; linseed, 8900; flax fiber, 7600. Livestock statistics for June, 1938, were: Cattle, 661,000; sheep, 650,000; swine, 385,000; horses, 219,000. The net value of industrial production was estimated at 113,000,000 crowns in 1938. The leading industrial products, with the amounts produced in 1938 where available, were: Cotton fabrics, 21,872,000 yds.; cotton yarns, 11,684,000 yds. (1937); wood pulp, 11,473 metric tons; cellulose, 73,088 metric tons (1937); paper, 42,635,000 lb.; timber sawn in large-scale industries, 8,829,000 cu. ft.; matches, 52,000,000 boxes; oilshale, 1,473,000 metric tons; electric current, 150,000,000 kilowatt hours.

Foreign Trade. Imports for consumption were 107,198,000 crowns in 1938 (111,062,000 in 1937) and exports of Estonian products were 103,923,000 crowns (106,012,000). Of the 1937 imports, Germany supplied 26.1 per cent by value, United Kingdom 16.6, United States 8.2, and the Soviet Union 5.6 per cent. Of the 1937 exports, the United Kingdom took 33.9 per cent, Germany 30.5 per cent, Russia 4.1 per cent, and the United States 2.8 per cent. See IMPORTS AND EXPORTS.

Finance. For the fiscal year ending Mar. 31, 1940, the budget (exclusive of supplementary budgets) was estimated to balance at 105,878,000 krooni (crowns). Estimated current receipts (1938-39) were 106,018,000 krooni; capital receipts, 1,588,000 krooni; expenditures, 107,606,000 krooni. The public debt on Jan. 1, 1939, was divided as follows: External, \$19,880,000, £1,657,000 and 7,098,000 Swedish crowns; internal, 12,266,000 krooni. The Estonian crown exchanged at an average rate of \$0.2695 in 1937 and \$0.2712 in 1938.

Transportation. In 1938 Estonia had about 889 miles of railways, excluding tramways. (On the railway connecting Tallinn with the Russian frontier, the width of the tracks was altered in 1939 to conform with the Russian gauge. See *History*). There were (1939) 13,416 miles of roads and highways. Airlines in 1938 connected Tallinn, Helsinki, Leningrad, Berlin, Warsaw, and other

cities. The gross tonnage of the Estonian merchant marine on June 30, 1938, was 177,100. The net tonnage of vessels clearing Estonian ports (1938) was 62,000.

Government. The Constitution which went into effect Jan. 1, 1938, vested extensive powers in a President elected for six years. It established a bicameral National Assembly comprising a Chamber of 80 deputies elected by universal suffrage and a National Council of 40 elective, appointive, and ex-officio members. The National Assembly was to be renewed at least every four years. For the method of election of the President and National Assembly, see 1938 YEAR BOOK, p. 239. President, Konstantin Päts, elected Apr. 24, 1938. Premier at the beginning of 1939, Karl Einbund (Kaarel Eenpalu), re-appointed May 9, 1938.

HISTORY

Neutrality Policy. The internal struggle for further democratization of the government established in 1938 (see 1938 YEAR BOOK) was interrupted in 1939 by the onslaught of the European War and by the establishment of a Soviet protectorate over Estonia under cover of that conflict. Like the two other small Baltic states, Estonia fought throughout the first three quarters of 1939 to resist the demands of both the Soviet Union and Germany and to safeguard its independence and territorial integrity.

The Soviet proposal advanced in the spring for a joint Anglo-French-Soviet guarantee of the Baltic States' independence was no less firmly opposed by Estonia and Latvia than by Finland. The proposal collapsed when Britain and France refused to join Russia in forcing its acceptance upon these small states. Estonia and Latvia had long-standing non-aggression pacts with the Soviet Union. To further safeguard their security, they accepted Chancellor Hitler's offer of April 28 and on June 7 signed non-aggression treaties with the Reich. Yet no great trust was placed in either the Russian or German pledges. On June 23, the 22nd anniversary of Estonia's liberation from Russian domination, President Päts issued a patriotic appeal, declaring that "whosoever dares to violate our ancient country will meet our firm resistance." At the same time, to consolidate the government's position, he restored the military decorations and pension rights of 14 pro-Fascist opposition leaders who had lost their civil rights after the abortive revolutionary movement of 1933.

The Soviet Threat. Once Germany became involved in war with France and Britain and was no longer in a position to oppose Soviet ambitions in the Baltic, Moscow seized the opportunity to obtain by threat of force the concessions the little Baltic States had refused to grant voluntarily earlier in the year. Estonia was the first victim. Beginning September 19 the Moscow Government adopted a belligerent attitude. It accused Estonia of unneutral conduct in permitting the escape of an interned Polish submarine from the port of Tallinn. The little Estonian army was cowed by large Russian troop concentrations on the frontier and by threatening demonstrations of the Red Navy and air force. The Estonian Foreign Minister was called to Moscow and presented with demands that made Estonia a military ally of the Soviet Union.

Mutual Assistance Pact. After a week of negotiation, the Estonian Government capitulated and accepted the Soviet conditions. Subjected to diplomatic threats and to violent attacks from the

Russian broadcasting stations, the Estonians lived in hourly fear of invasion, but hesitated to order mobilization lest it provoke the expected Soviet attack. The crisis eased with the signature of a Soviet-Estonian mutual assistance pact on September 29. The significant articles of the pact follow:

I. The two contracting parties undertake to render each other every assistance, including military, in the event of direct aggression or menace of aggression arising on the part of any great European power against the sea frontiers of the contracting parties in the Baltic Sea or their land frontiers across the territory of the Latvian Republic, as well as against bases indicated in Article III.

II. The U.S.S.R. undertakes to render the Estonian Army assistance in armaments and other military equipment on favorable terms.

III. The Estonian Republic assures the Soviet Union the right to maintain naval bases and several airdromes for aviation on lease terms at a reasonable price on the Estonian islands of Saaremaa (Oesel), Hiiumaa (Dagoe) and in the town of Paldiski (Baltic Port).

The exact sites for bases and airdromes shall be allotted and their boundaries defined by mutual agreement. For the protection of the naval bases and airdromes the U.S.S.R. has the right to maintain at its own expense on the sites allotted for bases and airdromes Soviet land and air armed forces of strictly limited strength, their maximum numbers to be determined by special agreement.

IV. The two contracting parties undertake not to conclude any alliances nor participate in any coalitions directed against one of the contracting parties.

V. Realization of this pact should not affect in any extent the sovereign rights of the contracting parties, in particular their economic systems and State organization. The sites allotted for bases and airdromes (Article III) remain the territory of the Estonian Republic.

VI. This pact comes into force on the exchange of instruments of ratification. The exchange of these instruments shall take place in Tallinn within six days from the signature of this pact. The term of validity of this pact is ten years and if one of the contracting parties does not find it necessary to denounce this pact one year prior to expiration of its term, the pact shall automatically continue valid for the next five years.

The preamble of the treaty stated that it was "based on recognition of the independent state of existence and on non-intervention in the internal affairs of the other party." The treaty was ratified by the Estonian Government on October 4, one hour before expiration of the six-day time limit. A trade-balancing agreement, signed by the two countries on September 28, went into effect October 1. It provided for a possible increase in mutual trade to about \$4,600,000 for each country per year and gave each the right to ship goods through the territory of the other.

New Cabinet Formed. Before the Russian garrisons, estimated to total some 20,000 men, entered Estonia beginning October 18, the Estonian Cabinet resigned on October 10. The cause of the crisis was said to be Russian demands for additional air bases and increase of the garrison areas. The final protocol fixing the places and conditions under which Soviet troops were to occupy Estonian territory was signed on October 11. The next day a new cabinet was formed under Professor Juri Uluots, with Antonius Piip as Foreign Minister. Gen. Johan Laidoner, hero of the Estonian struggle for independence, remained commander-in-chief of the armed forces.

A fleet of 11 Soviet warships arrived at Tallinn October 15 and landed the first contingent of Soviet troops at Baltic Port. On October 18 other Red Army troops marched across the Estonian frontier to garrison the allotted seaboard bases. Installation of the Soviet forces was completed by October 20 in orderly and peaceful fashion. The Soviet troops, according to news correspondents, actively sought to win the good will of the Estonians. The latter gave them a formal welcome, but declined invitations to attend propaganda mov-

ies and lectures given by the Soviet garrisons. Many Estonians were employed by the Russians in constructing new barracks and repairing the old structures used by Czarist troops at some of the naval bases before the establishment of the Republic of Estonia.

Soviet-Estonian Difficulties. Difficulties resulting from the presence of Soviet garrisons increased in subsequent weeks. Encouraged by the presence of Russian troops, Estonian Communists resumed their political activities, forbidden by Estonian law. When arrested and imprisoned, they appealed to the Soviet garrison commanders for assistance, but this was refused. The small Russian minority in Estonia demanded special rights. Friction developed between the garrison authorities and the adjacent Estonian populations. On November 11 Estonian inhabitants of zones adjoining the Soviet garrisons were removed, apparently because of the desire of Soviet authorities to isolate their troops from anti-Communist propaganda. All foreigners were expelled from the localities of the Soviet garrisons and they were required to obtain permits to reside in other parts of Estonia. Early in December the Russians began to use their new Estonian bases to launch air raids and naval attacks upon Finland. This exposed Estonia to Finnish diplomatic protests, backed by the threat of retaliatory raids.

Relations between the Estonian and Russian Governments remained cordial up to the end of 1939, however. The anniversary of the Bolshevik Revolution was celebrated in Estonia for the first time on November 7. Early in December the Estonian army chief, General Laidoner, visited Moscow at the invitation of the Soviet Government and received flattering attentions. On returning, he announced that Moscow had offered to aid materially in strengthening the Estonian armed forces.

The Uluots Government. Meanwhile the new Estonian Cabinet had been seeking to strengthen its position against Communist and other internal enemies. Addressing Parliament on October 19 Premier Uluots announced various social reforms, including more provincial self-government and an increase in the general wage scale. On October 20 he said that although his government had sought to include all parties, some of them had refused their co-operation. Shortly afterwards the "state of emergency" in effect throughout the preceding year was prolonged until Sept. 12, 1940.

Departure of Balts. Before Russian troops entered Estonia and her sister Baltic States—Latvia and Lithuania—there was a hasty evacuation of Russian anti-Bolshevik refugees and various other groups that considered the mutual assistance pacts as the first step toward eventual sovietization of the Baltic countries. The largest and most important group to leave was the Balts—the German minority that had played an important economic, political, and social role in the Baltic countries for over 800 years. On October 7 the German Ministers to all three countries asked the three governments to arrange for the immediate transfer of the Balts to the Reich.

The 15,000 Balts in Estonia received the first word of their fate on October 7 when German ships arrived at Tallinn, Arendsburg, and Paernau for their evacuation. They were given 48 hours to decide whether to stay and face possible Bolshevik rule or accept German nationality. It was October 13, however, before the first shipload of emigrés sailed for Germany, after feverish at-

tempts to dispose of their properties. On October 15 a mixed Estonian-German commission reached an agreement whereby the emigrés' properties in Estonia were registered to the special account of the German Legation. The funds were to be transferred abroad in such a way as not to injure the Estonian balance of payments or economic life. The Estonian Balts owned estimated cash and deposits of \$1,250,000 and capital investments estimated at \$200,000,000. By this agreement Estonian nationals of German ancestry were given three months in which to cancel their Estonian citizenship and leave the country.

By the end of 1939 most of the Balts in Estonia had left for the conquered Polish territories of the Reich. Those who remained were expected to assimilate with the Estonians, giving up their language, schools and even changing their German names. This was done at the demand of both Estonia and the Soviet Union, both of which were anxious to remove any excuse for possible future German intervention on behalf of the remaining German minorities. There was Estonian-German friction over the sum to be paid in liquidating Baltic German properties and over the seizure of the Estonian steamer *Estonia* by a German warship on December 15. The ship was en route from Tallinn to Stockholm with 110 Poles, including many high officers.

Baltic Conference. Notwithstanding the changed status of the Baltic States, the Foreign Ministers of Estonia, Latvia, and Lithuania met in Tallinn on December 7-8 for the regular conference of the Baltic Entente. Their foreign policies, however, were now largely dictated by the Soviet Union.

ETHIOPIA. A former native empire in East Africa, formally annexed by Italy on May 9, 1936, following its conquest by force of arms (see 1935 and 1936 YEAR BOOKS under ETHIOPIA). Area, about 347,500 square miles; population, roughly estimated at over 4,000,000. By the decree law of June 1, 1936, Ethiopia was incorporated with Eritrea and Italian Somaliland to form the colony of ITALIAN EAST AFRICA (q.v.).

EUGENICS SOCIETY, AMERICAN. A society incorporated in 1926 as successor to Eugenics Committee of the U.S.A., and Eugenics Society of the U.S.A. Its work is educational and is directed to improve human heredity so that in the future there will be fewer defective strains and an improved hereditary quality in all our people, by developing to their utmost all influences which may help to bring about a more eugenic distribution of births so that those parents, regardless of economic, racial, or regional grouping, who best provide the essentials necessary for the development of character and intelligence, being also those who on the whole pass on to their children a biological inheritance superior to the average of the nation, will have the major portion of the country's children. To this end the Society co-operates with agencies devoted to education, recreation, public health, religion, social service, and social readjustment in order to discover and promote measures by which each can make it easier for responsible parents in every class of society

COMMANDERS IN THE EUROPEAN WAR

FORTIFICATIONS ON WESTERN FRONT

Top: German soldiers working on tank traps and barbed wire and cable entanglements of the Westwall. *Center:* Rear entrance to a fort in France's Maginot Line, sheltered from enemy fire by the hill in the background. *Bottom:* The guns of the fort pictured above dominate approaches to the Maginot Line, criss-crossed with tank and barbed-wire barriers, such as those shown here

to have families of reasonable size without undue financial and social sacrifice.

The membership and regular mailing list of the Society numbers about 1500, including individuals and organizations. In January 1939 the Society published *American Eugenics Today* which is the most explicit statement of eugenic policy yet made by the Society. In March, 1939, the Society took over the publication of *Eugenical News*, now published quarterly under the direction of the following Editorial Committee: Robert C. Cook, Editor *The Journal of Heredity*, Robert Littell, Associate Editor, *Reader's Digest*, Frederick Osborn, Population Association of America, Albert E. Wiggam, Lecturer and Writer.

Total annual budget: \$8000 (\$3000-\$4000 from membership: \$3000-\$4000 from special contributions). Samuel J. Holmes, President; Mrs. Shepard Krech, Vice President; Frederick Osborn, Treasurer. The office address is 50 West 50th Street, New York City, Rudolf C. Bertheau, Secretary.

EUROPE. A continent with an area of about 2,094,500 square miles and a population estimated at 399,800,000 (excluding the U.S.S.R.) on Dec. 31, 1938. EUROPEAN ARCHITECTURE. See **ARCHITECTURE**.

EUROPEAN WAR. The European War of 1939 opened on September 1, as German Heinkel bombers dropped bombs upon Gdynia and other Polish towns and the German Army smashed across the Polish frontiers from North, South, and West. Two days later, Sunday, September 3, as the world listened to the radio, Great Britain accepted "the dreadful arbitrament of the sword" and France joined her Allies—Great Britain and Poland—in war against Germany. Thus "Der Tag" came to Europe for the second time within the memory of men still young, and for the second time within a quarter of a century men called it the start of a World War.

It was the most advertised, and probably the most dreaded, war in history. As early as the first days of August German factory owners near

ler's Germany—her entire system of life geared in peacetime to a wartime economy—had no tremendous transition to make from the peace that was no peace in the Europe of 1939 to the war that followed the German invasion of Poland. On land, sea, and in the air Germany was mobilized and ready for a quick war. Her industry, particularly her air industry, was not producing at maximum capacity at the end of August, but it was geared to a rapid increase in tempo. Her Regular Army, all its divisions at war strength and bolstered by S.S. [Elite Guard] and Reserve units, was massed along the Polish frontier; Landwehr units occupied the bunkers and casemates of the Westwall; Reserves were being organized and were in training throughout the country. The air force, with four *Luftflotten*, or air fleets, organized and equipped, was ready for instant large-scale action, while the navy, with perhaps 60 submarines in commission, three of the famous *Deutschland* class "pocket battle-ships," and the 26,000-ton *Scharnhorst* and *Gneisenau*, was equipped to play its role in the tragic drama that was to come.

In striking contrast to the German preparedness was the Allied unpreparedness. Poland had brought her 30 regular divisions up to full war strength by the end of August, but the order for general mobilization (a 60-day process) was not issued until a few hours before hostilities commenced. France had called extra classes and specialist reserves to the colors, and the Maginot Line was well manned by the "shell fish of the forts" (*écureuilles de rempart*), but France was in no sense on a war footing. Britain had mobilized her Reserve Fleet and taken other precautionary measures, but none of the Allied powers was so well prepared for instant war as were the Germans.

ARMIES

frontier points had been ordered to evacuate their stock piles and machinery into rear areas; in the industrial town of Aachen near the Belgian border even women and children had been warned to leave. A short time before hostilities opened (it was subsequently learned) from 20 to 30 German submarines passed out through the Kattegat and Skagerrak from the Baltic into the North Sea—and three Polish destroyers (the *Grom*, *Blyskawica*, and *Burza*) quietly left the Polish seaport and naval base of Gdynia—and joined the British Home Fleet in Scottish bases.

The Opposing Forces. Despite these warnings the opposing nations were not equally prepared for the conflict. The Third Reich of Hit-

* The naval figures include all ships both new and old in the five principal categories—battleships and battle cruisers; aircraft carriers, cruisers, destroyers and submarines. Miscellaneous and auxiliary vessels such as torpedo boats, patrol boats, mine-sweepers, etc., which add a considerable additional tonnage, especially in the case of the British Navy, are not included.

The geographical position of Germany—the great mass of her territory interposing between strong England and France in the West and weak Poland in the East—gave her the advantage of what is known in military parlance as “interior lines.” Thus, although the Third Reich of Hitler like the Empire of the Kaiser, found itself, despite Bismarck’s warning, fighting on two fronts, the German *Wehrmacht*, taking advantage of its interior lines and the strong fortifications of the Westwall fronting France, moved swiftly to smash the weakest enemy, Poland. Its reservists in the West, from behind the steel and concrete fortifications of the Westwall, held off the slowly-gathering French forces, during the early days of the war, while the Reich’s major effort, delivered with the force of a sledge hammer and yet directed with the deftness and dexterity of a rapier-thrust, was to the East, with the obvious hope of achieving a quick conquest of Poland, and facing the world with a *fait accompli*.

THE POLISH CAMPAIGN

The resulting campaign against the Poles is known to the Germans as *Der Feldzug Der Achtzehn Tage* (The Campaign of the Eighteen Days), and to the world as the Nazi *Blitzkrieg*, while to army men everywhere it has already become a model of military precision, a classic of a kind to be studied and re-studied in years to come. No complete data as to the campaign were available from either side at the close of the year, but from official communiqués issued by both sides and verified press reports it can be approximately reconstructed.

German Forces and Plan. Zero hour, when the German troops crossed the Polish frontier, was 5:30 a.m., September 1. The German forces thrown against Poland were organized and commanded as follows:

Adolph Hitler—Der Führer, and Commander-in-Chief of all arms; Gen. Wilhelm Keitel, Chief of the Supreme Command of the Defense Forces (Chief of Staff to Hitler).

Land Forces

Gen. Walther von Brauchitsch, Commander-in-Chief of the Army; Gen. Franz Halder, Chief of the General Staff.

Northern Army Group of Two Armies: Gen. Fedor von Bock, Commanding; General Salmuth, Chief of Staff. The Fourth Army, Gen. Guenther von Kluge, Army Commander. The Third Army, General von Kuchler, Army Commander.

Southern Army Group of Three Armies: Gen. Gerd von Runstedt, Commanding; General von Manstein, Chief of Staff. The Tenth Army, Gen. Walther von Reichenau, Army Commander. The Fourteenth Army, Gen. Wilhelm List, Army Commander. The Eighth Army, Gen. Johannes Blaskowitz, Army Commander.

Total Land Forces: 35 to 55 infantry divisions (division strength—15,224 officers and men); 4 to 6 light divisions (motorized infantry, plus tanks, etc.); 4 to 6 *Panzerdivisionen* (armored division—strength about 11,000 men, plus 425 light tanks); 2 to 3 mountain divisions; 1 cavalry brigade; Condor Legion (specially organized veterans of Spanish Civil War); S.S. troops; miscellaneous units; total—900,000 to 1,200,000 men.

Air Forces

Field Marshal Hermann Goering, Commander-in-Chief; General Jeschonnek, Chief of Staff. Air Fleet #1 (Re-enforced), Gen. Albert Kesselring, Commanding. Air Fleet #4 (Re-enforced), General Löhner, Commanding. Total—1200 to 2500 planes.

Naval Forces

Adm. Erich Raeder, Commander-in-Chief; special naval forces in Danzig Bay, Adm. Conrad Albrecht, commanding. Two second-class battleships, *Schleswig-Holstein* and *Schlesien*; minesweepers, destroyers, torpedo boats and small craft.

Fortifications

Fortified zone around Frankfurt-am-Oder, local and coastal fortifications at Königsburg (East Prussia).

The German plan of campaign was simple. Poland, 1240 miles of her borders enclosed between the pincer-like jaws of the German state, was to be overrun from three directions. The planes of the air force from bases in Pomerania, Schlesien, Slovakia, and East Prussia were to shuttle back and forth across Poland bombing and machine-gunning intensively; the naval forces were to launch an assault from the Baltic against Danzig, the Polish Westerplatte munitions base in Danzig harbor, Gdynia, the fortified peninsula of Hel and the little strip of Polish coast; and the army, upon which the burden of victory was principally to rest, was to thrust deeply into Poland, using on a grand scale the favorite German outflanking tactics—the classic double envelopment, first brilliantly demonstrated by Hannibal at the Battle of Cannae 2000 years ago. The two army groups, one driving from the north, the other from the south, were to encircle Warsaw in an attempt to bar the retreat to the East of the main Polish forces and to surround and destroy them. Any Polish detachments which escaped this net were to be surrounded later by an even more sweeping operation—the northern and southern pincers of which were to be joined behind the San and the Bug Rivers. The German center—in front of the Poznan salient—was purposely held but weakly by frontier detachments who were backed up, however, by the Frankfurt fortified zone.

Polish Forces. The Polish forces that opposed these thrusts were organized as follows:

Marshal Edward Smigly-Rydz, Inspector General of the army and ostensible dictator, Commander-in-Chief; Gen. J. Stachiewicz, Chief of Staff.

Land Forces

Northern Army Group; Central Army Group; Southern Army Group; miscellaneous and detached units and units in process of organization and mobilization.

Total Mobilized: About 30 infantry divisions (division strength, 12,000); 14 cavalry brigades; miscellaneous and attached units—500,000 men. Total additional in process of mobilization: 30 infantry divisions—500,000 men.

Air Forces

Regular Polish Air Force of 700 to 900 planes, based at Okęcie (Warsaw); Lublin, Deblin, Brest Litovsk, Tezeu, Grudziadz, Mława, Katowice, Krakau, Vilna, Gdynia, Posnan, etc.

Naval Forces

Four destroyers; four submarines; one minelayer; and light craft based on Gdynia.

Fortifications

Main pillbox line in front of Upper Silesian industrial area from north of Czechochowa to Katowice. Another pillbox line on the south bank of the Narew near Lomza and Nowogrod. Strong coastal and land fortifications at Gdynia, Peninsula of Hel, Westerplatte. Fortresses at Modlin, Przemysl, Brest Litovsk. Local fortifications (mostly field fortifications) and local defense lines along Brahe River, Warta River, Posen, Lodz, Warsaw, Mława, Bydgoszcz, Grudziadz, Lwow. None of the fortifications in any sense comparable to French Maginot Line, or German Westwall.

The Polish plan of campaign is not yet clear—may never be completely clear—since most of the leaders responsible for its conception and execution are either dead, wounded, captives, or in exile or internment. Enough is known, however, to indicate with considerable authority that the advice of the French Military Mission at Warsaw and of British officers there was apparently discarded. Allied advisers strongly suggested that

it would be impossible for the Polish armies to hold off the invaders near the strategically indefensible Polish frontiers, and urged that delaying actions only be fought in the western part of the country, and that the main line of resistance be established behind the traditional Polish defensive triangle—the line of the Vistula, Narew and Bug Rivers, which join near Warsaw.

It is not difficult to understand, in the light of Poland's past history, why the Allied advice was apparently ignored. Josef Beck, Polish Foreign Minister, had long been notoriously anti-French. And, ever since 1920 when Gen. Maxime Weygand, now commander of the French forces in the Near East, had aided Marshal Pilsudski, Polish national hero, to win the Battle of the Vistula in the Polish-Bolshevist wars—and had received in the eyes of the world major credit for the resultant victory—there had been an obvious undercurrent in the Polish Army which set strongly against France (due, in large part, to the sensitive Polish national pride).

In any case the aftermath showed rather clearly that the Polish plan of campaign envisaged more than delaying actions west of the Vistula. For the bulk of the Polish army was apparently concentrated west of the Vistula when hostilities started, with a part of the Northern Army Group in the Corridor, and another part North of Warsaw. The bulk of the Central Group—strongest of the three groups—was apparently somewhat north of Lodz, between Poznan and Kutno; while the Southern armies guarded the Upper Silesian industrial area, with the main strength concentrated between Krakau (Cracow) and Lwow.

According to the official German account of the campaign the mission of the Northern Polish soldiers was to secure Danzig, and later, assisted by reserve divisions being mobilized in Eastern Poland (near Bialystok, Augustow and Suwalki), to launch an attack from three sides against East Prussia, thus eliminating this German "island."

To the Poles such an operation might indeed have seemed entirely practicable, since they professed to believe until the last that German offensive military operations from East Prussia as a base were impossible, a belief which proved to be one of the fatal miscalculations of the campaign.

The Central Army Group, intended as a strong centrally-located army of maneuver, could, it was thought, pivot and wheel in any direction to meet a German threat and would offer protection to the flank of the invading Northern group, while at the same time threatening the flank of any German Army advancing against the Corridor. The Southern Group was intended to hold, as long as possible, the exposed Upper Silesian area, and then to secure the newly-developed "industrial triangle," the so-called *Centralny Okreg Przemyslowy*, situated near Sandomierz between the valleys of the Vistula and San Rivers.

Operations. The German land assault, starting the morning of September 1, was accompanied and preceded by what was probably the most intensive use of air power in history. German planes shuttled back and forth across Poland day after day and night after night; their first objectives the weak Polish air force itself, its fields, gasoline supplies, and factories. That air force, its fields, hangars, and planes bombed and destroyed, its fighters shot out of the skies, many

of its planes badly handled or handled scarcely at all, was quickly eliminated as an active factor in the campaign, and the German Heinkel and Dornier bombers turned their attention to railroads, stations, bridges, roads, lines of communication, to the concentration areas of the Polish reserve divisions, and eventually, to cities and towns. In less than a week since the first German bombs dropped without warning in the preliminary surprise raids on Gdynia, Krakau, Katowice, and other Polish cities early on the morning of September 1, more than 60 towns and cities as far east as Brest Litovsk were bombed by Germany's roaring armadas.

The importance, therefore, of the air arm in the German *Blitzkrieg* cannot be overemphasized. It severed Polish communication and transportation lines; it hampered or prevented mobilization of reserve units; aided by an efficiently-organized ground intelligence and espionage service and by ground reconnaissance units, it detected and reported to GHQ every concentration of Polish troops, no matter how small; it extended the long arm of war over the entire Polish countryside; it weakened Polish morale; it blinded, harried, confused and disrupted the Polish army and the Polish nation. The planes were used both strategically and tactically—strategically for attacks on distant objectives such as those outlined above; tactically, in closer co-operation with the German ground forces for assaults upon Polish fortifications, artillery emplacements and rear areas. It extended the range of the artillery; strafed ground troops and aided a "break-through" of trench systems and fortifications. The air arm assisted materially in turning defeats into routs, and was an essential ingredient in the German formula for *Blitzkrieg*.

But the gasoline engine on the ground, no less than the gasoline engine in the air, contributed most importantly to that victory. With no major terrain obstacle confronting them until the Vistula was reached, with the flat level plains of Poland hard-baked by the suns of summer, the Germans utilized mechanized and motorized forces extensively and daringly. Correctly calculating the inferior caliber of the leadership, equipment, and training of the Polish forces, the Germans did not hesitate to expose some of their advanced units to risks which could not safely have been assumed against a first class opponent. Their basic tactics were simple—the tactics of encirclement; but their methods, in speed and co-ordination, were surprisingly effective.

The most applicable analogy is, perhaps, to liken the German advance to the action of the waves of an incoming tide upon a beach. As the waves gradually lick up the beach they encounter hills or domes of sand—citadels of resistance. Part of the water eats away frontally at these isolated citadels; the rest of it rushes, with the force and speed of a torrent, seeking the lines of least resistance, through the valleys and low places, sweeping around in a foaming cascade of white to the rear of the "citadels" of sand, encircling them, lapping away at their flanks and sides until finally the structure, assaulted from all sides, collapses. So did the German Army move into Poland, using on a grand scale and with mechanized modifications the "infiltration" tactics it devised during the World War. As its infantry divisions came up against the few Polish pillboxes, or against determined Polish resistance and artillery was brought into position

to aid the infantry in blasting a way through, the German armored and light divisions reached out toward the Polish flanks, seeking soft spots in the enemy line, seeking the paths of least resistance, and once found, broke through, to surge upon the enemy's flanks and into his rear areas. It was a process a hundred times repeated, a perpetual process of outflanking and envelopment, which broke the Polish resistance up into relatively small and isolated fragments, which were destroyed piecemeal.

Mobility was the keynote of the lightning war; the Polish campaign was a war of maneuver, a war of movement which never became static or immobilized. Against such rapidity of movement, against the speed of the German armored and motorized units which fanned out across the flat Polish countryside, driving up all the roads, rumbling cross country deep into the enemy's rear areas, the plodding Polish infantry, even the dashing Polish cavalry (which, armed with the obsolete lance and the saber still employed the picturesque but pitiful tactics of *Balaklava*) were helpless.

A handful of Polish cavalymen scored initial but short-lived successes (the only Polish successes of the brief campaign) when they advanced against little opposition a short distance across the German frontier in the weakly-held Posnan area and also in East Prussia. But Armageddon had started; these cavalymen, flushed with "victory," were soon struck down in the avalanche that brought death and disaster to their country.

The lack of adequate anti-tank equipment, the failure of the Polish high command to have adequate field fortifications prepared, or an adequate main line of resistance laid out, the failure to provide satisfactory road blocks or tank traps, the total collapse, under the first smashing blows of the *Blitzkrieg*, of the Polish radio, and other communications—all materially facilitated the German operations. The Poles, blinded, cut up, confused, never knew the true situation; were rarely accurately informed of the German positions or movements; the Germans, on the other hand were kept constantly informed of every Polish movement. The result was inevitable; not only field officers but division and army commanders were captured with their entire staffs and often with a major part of their commands. After the first week of war the issue was never in doubt.

Danzig Occupied. As the *Schleswig-Holstein* opened the ball by bombarding the *Westplatte* in Danzig Harbor and Storm troopers and soldiers from East Prussia took over the Danzig Free State with but sporadic and short-lived opposition, von Kluge's Fourth Army—part of the Northern Army Group—pushed into the Polish Corridor from Pomerania in the general direction of Bydgoszcz (Bromberg) and Grudziadz (Graudenz). Its mission was to force a crossing of the Vistula between those two towns and to establish connection with the right wing of von Kuchler's Third Army which drove southward from East Prussia in the general direction of Chelmno. At the same time the main body of the Third Army attacked due south in the general direction Allenstein-Mlawa-Warsaw while this army's left flank extended as far eastward as Lomza. It was the mission of this army to force crossings of the Narew and the Bug Rivers, and to effect a juncture to the east of War-

saw with von Reichenau's Tenth Army, one of the three armies in the German Southern Army Group.

Simultaneously large-scale assaults over a great part of Poland's southwestern frontier were made by the Southern Army Group's three armies. von Reichenau's army, in the center, advanced in the general northeasterly direction Kreuzberg-Warsaw; while on von Reichenau's left flank, the Eighth Army of General Blaskowitz pushed from east of Breslau in the general direction of Lodz. In the extreme southwest, where List's Fourteenth Army extended around the Polish frontier into Moravia and Slovakia the attack was made in two directions, the left flank striking toward Katowice and the lower industrial area from Breslau and Gleiwitz, the center in the general direction of Krakau (Cracow) and the headwaters of the Vistula, and the right flank, assisted by Austrian and Slovakian troops and mountain divisions, driving from the south north and northeastwards through Jablunka Pass in the Western Beskids (part of the Carpathian range), and then, after establishing liaison with the German troops advancing from Silesia, turning to the east and pushing toward Sucha and Neumarkt and on through the foothills on the Polish side of the Carpathian range. A small detachment, operating on the extreme German right flank, later pushed through the Dukla Pass to join the main drive.

These operations, nicely articulated although conducted by widely separated forces, were designed to pinch off the Corridor in the north, the Silesian industrial area in the south and thence to swing wide the pincers of steel around Warsaw and the bulk of the Polish Army. In these objectives the Germans were everywhere and speedily successful.

Polish Corridor Cut. By the end of the second day of war, the Corridor had been practically nipped off by the forces converging from Pomerania and East Prussia; the Fourth Army's Pomeranian and Brandenburg infantry broke through the Polish Brahe River lines; the Third Army, pushing southwards from East Prussia reached Mlawa; the Southern Army Group was battering at the pillboxes and bunkers in front of the Upper Silesian industrial area and mountain divisions had forced a passage through the Jablunka Pass; and had reached a line between Neumarkt and Sucha. The local fortifications of Bydgoszcz and Grudziadz at the base of the Corridor were stormed the next day (September 3); the Polish strip of seacoast, already besieged from the sea, was rapidly invested from the land; and the mopping up of Polish troops in the Corridor (including a cavalry brigade and one or more infantry divisions) commenced. (This action, known as the "Battle of Tuchola Heath," resulted in the destruction of Polish forces, about 15,000 strong.)

Polish fortress troops in the southern pillbox line put up for a few hours a stiff resistance to a frontal assault by the Condor Legion, but as German mechanized units filtered through weak spots in the line and fanned out around the flanks of the fortified area, this early resistance quickly collapsed; a few units of the Southern Polish Army group near the frontier were quickly captured or destroyed or retired rapidly in a retreat that soon became a rout. By September 5, German armies had taken most of the Upper Silesian industrial district; a day later they had taken

Krakau, ancient "heart of Poland," while the Eighth Army, with the Tenth on its right flank, had brushed back the Polish delaying forces east of Breslau; had forced a crossing of the Polish defense line (strengthened by pillboxes) on the Warthe River and were stabbing at the textile town of Lodz, while the Northern Armies had driven south from East Prussia within 21 miles of Warsaw.

Day after day mechanized and motorized spearheads were driven deeper and deeper into Poland, while behind the motorized detachments came the German infantry, fighting their way in an advance remarkable for its speed.

German Pincers Close. The first five days were—in the unmilitary vernacular of the streets—the "pay-off"; and by September 8 the Polish campaign had been, to all intents and purposes, decided. By this date, the great reaching pincers had already started to close about Warsaw, and part of a German armored division actually forced its way into the Polish capital, though it quickly withdrew (part of the Tenth Army, which fought its way 140 miles within a week).

The great bulk of the Polish Army was virtually trapped west of the Vistula; the German Third Army, driving south from East Prussia, had, after some hours of delay caused by the Polish fortifications along the Narew forced a passage of this river and an advance detachment had secured a bridgehead across the Bug at Wyszkow; while List's Fourteenth Army in the south was rolling rapidly eastward toward the fortress of Przemyśl and Lwow, and units of the Fourteenth and Tenth Armies had crossed the Vistula; turned the southern flank of the Vistula Line; and had taken Sandomierz, heart of the industrial triangle, to add to the rich prize of the Upper Silesian coal, iron, zinc, and industrial area.

The rapid encircling movements of the German forces and the deep mechanized spearheads thrust into the country had already resulted in surrounding, destroying or capturing large Polish detachments; some divisions had already been completely broken up and thousands of Polish troops had surrendered, while very sizeable forces were surrounded—their backs to the Vistula—

Life Magazine

THE CONQUEST OF POLAND

The rapid advance of the German armies is shown in black on this series of maps. The progress of the Russian invasion from September 17 to September 19 is indicated by the black line on the final map of the series

by Reichenau's Tenth Army at Radom. (This battle was fought north of the Lysa Gora hills between Radom, Zwolen and the Vistula.)

Thus, within little more than a week of war both of Poland's principal industrial areas had fallen within enemy hands; the traditional defensive line of the Vistula and the Bug had been turned from north and south; the bulk of the Polish Army was virtually trapped west of the Vistula and a nation of 30,000,000 people, into whose re-creation had gone the blood and sweat and agony, the hopes and cherished dreams of Pilsudski and his Legions, Paderewski, and his friends of intellect and heart, was almost conquered.

Yet the Poles fought on—blindly most of them, in isolated units, cut off from each other, knowing nothing of the course of the campaign, believing, some of them, that the "English are coming"; that East Prussia had been overrun; that Polish troops were marching toward Berlin. Some did not believe this; even before defeat was complete the Polish Government and Smigly-Rydz left Warsaw, the threatened capital, on September 6 and while fighting was still in progress crossed into Rumania, internment and obscurity eleven days later. The Polish soldiers died bravely, and some few of the units—particularly one or two of the cavalry brigades (judging from the incomplete accounts available)—did effective work.

But against the onrushing German tide these units were no more adequate than Mrs. Partington's mop; they melted away under the German hammerings and the end was not far.

Battle of the Bzura. By September 14, the Polish forces surrounded at Radom, estimated by the Germans at more than four divisions of 60,000 men had "ceased to exist" (i.e. had been killed or had been taken prisoner). Warsaw and the fortress of Modlin had been almost completely cut off; reaching fingers of steel were grasping toward Lwow and Brest Litovsk; the second and wide-sweeping pincer movement contemplated by the German plan had started, and major elements of the German Third, Fourth, Eighth, and Tenth Armies, commanded by General von Runstedt, had formed a great pocket around the bulk of the trapped Polish army, forced together and compressed into the "bend of the Vistula" in an area west of Warsaw, east of Posen, centering around Kutno, between the Bzura River and the Vistula.

Around the Bzura took place the major battle of the campaign, and while battered and embattled Warsaw sent to the world via its remaining radio station plaintive appeals for aid and the first delicate notes of Chopin's "Polonaise," the Germans proceeded to tighten the steel ring and to repulse every effort of the large Polish forces to break through. The battle of the Bzura, gradually waned between September 17 and September 20, after a ten-day struggle in which the German ring of steel tightened inexorably around several hundred thousand Polish troops. The Germans claimed more than 300,000 prisoners from this one action alone, as well as a vast quantity of war materials, and the Polish General Bortnowski and his entire staff was captured in the Bzura River marshes.

Fall of Warsaw. Simultaneously with this battle other German troops completed the encirclement and isolation of Warsaw and Modlin; took the fortress of Przemyśl in the south; captured

or destroyed the Polish southern army; besieged Lwow in the south; captured Brest Litovsk in the north, and Gdynia on the seacoast and units of Germany's northern and southern army groups joined hands at Wlodawa far behind the Vistula on September 16, having fought and marched their way some 200 to 400 miles across a hostile country in 16 days.

The Polish campaign was over, but Warsaw endured, burning, battered, bloody but unbowed, until—hundreds of its buildings gutted or ruined, its dead buried in the parks, the capital of Poland surrendered unconditionally on September 27, and its garrison of almost 100,000 (soldiers swollen by reservists and civilians) became German prisoners of war. The fortress of Modlin surrendered the next day, and the fortified peninsula of Hel, near Gdynia, which held out until October 1 was the last "island" of Polish soil, where organized resistance continued.

Soviet Intervention. As the Battle of the Bzura was ending and after the conquest of Poland was virtually complete, the armies of Soviet Russia—perhaps 500,000 strong—marched westward at 4 a.m. on September 17 across the Polish eastern border (obviously by prearrangement with the Germans) and advancing through White Russia in the north and the Ukraine in the south, pushed toward the furthest outposts of the German advance. The German *Blitzkrieg* had been so rapid, so devastating and so complete that any prospect of continued organized resistance from the Poles had gone before the Russians moved across the frontier. But the Russian "stab in the back," as the Poles describe it, did, undoubtedly, completely eliminate any hopes the Poles may have entertained of commencing an effective guerrilla warfare from bases in the Carpathians and the fastnesses of the Pripet Marshes.

Polish resistance to this new and unexpected assault was naturally sporadic and feeble. The Russians sent some of their motorized units and tanks rumbling ahead of their main forces deep into Poland, but the bulk of the Soviet invaders plodded along in the traditionally slow but ponderous fashion of the Czarist armies. The Russian "procession"—(it could scarcely be dignified by the term "invasion," since the resistance offered by a couple of Polish divisions and a couple of cavalry brigades was in no sense commensurate with the strength of the Russian forces)—moved, in the north, toward Wilno (Vilna) (which they took on September 19); Grodno (taken on the 20th) and in the direction Baranowicz-Bialystok, while another force, skirting the Pripet Marshes, curved to the south toward Brest Litovsk, where a conference between the German and Russian high commands was subsequently held to decide the details of Poland's fourth partitionment. In the south Russian forces moved toward Wlodzimierz, Lwow (where they relieved German troops engaged in siege operations and took the city September 19), Stanislaw and toward the Rumanian frontier and quickly cut the Polish-Rumanian railroad line, thus entrapping a considerable number of Polish forces which had been retreating before the German advance.

A large number of Polish forces, however, including most of the Government officials and a number of high-ranking generals, succeeded in escaping to Rumania, as did a considerable number of civilian refugees. Other thousands were

interned in Lithuania, and several score Polish planes which had escaped destruction were interned in Rumania and Lithuania. Many of the Polish officers and refugees subsequently made their way to France, where the Polish "Government without a country" was completely reorganized, and a new Polish Army was formed to assist the French and British on the Western Front.

At subsequent conferences in Moscow and elsewhere, the German-Russian border, originally fixed along the Vistula, was altered to run from Lithuania along the Narew, the Bug and the San to the Hungarian frontier, and although isolated Polish groups—unaware of the tragic end of their country—still fought sporadically—against the Russians in the fastnesses and swamps of the Pripet Marshes, against the Germans in the forests and mountains of the south—all organized resistance was completely crushed before the end of September, and the world's first modern *Blitzkrieg* was ended.

It was an achievement, remarkable not alone because of the tremendous efficiency of the German military machine, an efficiency which probably stamped the German Army immediately as the best "short-war" army in the world, but also because of the remarkable inefficiency of the Polish defense forces. Poland was in reality a "dictatorship without a dictator" ruled by a "clique of colonels"; the Polish army was deficient in all but courage, and courage, in modern war, is not enough.

CASUALTIES OF THE POLISH CAMPAIGN

German

Dead—10,572. Wounded—30,322. Prisoners and Missing—3404. (Figures as given by Hitler up to September 30; probably incomplete). Planes lost—200 to 500. Naval losses—none.

Polish

Complete data may never be available. The entire Polish mobilized army of about 500,000 men was wiped out—killed, wounded, captured, missing or interned. Other partially mobilized units were also completely broken up. The Germans claimed 700,000 prisoners; and it is likely that the Poles lost from 50,000 to 100,000 killed in addition to heavy civilian casualties from bombings and artillery bombardment. The Polish air force was destroyed, and of the 77 light units of the Polish Navy only about five—the three modern destroyers *Grom* (Thunder), *Blyskawica* (Lightning) and *Burza* (Storm), which left the Baltic before war started, and two Polish submarines, the *Wilk* and the *Orzeł*, which escaped after hostilities commenced—survived the debacle to serve with the British Navy.

Russian

No accurate data available, but casualties believed extremely light; probably less than 2000 in all categories. Some Russian soldiers were killed in clashes with the Germans. Perhaps 5 to 50 planes lost.

See POLAND under *History*.

THE WESTERN FRONT

As Poland was dying the Western Allies—France and Britain—were mustering their strength for a struggle with the military might of Germany.

On land, operations in the West were immediately restricted, not only by difficult terrain and the crowding borders of neutral states—Switzerland, Belgium, Holland, and tiny Luxemburg, but also by two tremendous lines of fortifications—the French Maginot Line, and the German Westwall—both consisting of tank traps, trenches, barbed wire, pillboxes, casemates, and great steel-and-concrete fortifications extending deep into the earth. The Maginot Line, at the

outbreak of war reached from the Channel to Switzerland, with an extended spur along the crest of the Juras as far south as Lake Geneva. That section of the line opposite Belgium, situated in unfavorable terrain, was not, however, as strong as that tremendous fortified zone which guarded the route of direct invasion into France—the Maginot Line proper, between Belgium and the Rhine at Lauterbourg. The German Westwall, recently built, had not been completely finished when hostilities commenced, but the main part of the fortified zone between Trier on the Moselle and Karlsruhe near the Rhine and thence southwards through the Black Forest to Switzerland was well-nigh ready. Work on those parts of the line which extended as far north as the Dutch frontier was continued during the early months of hostilities and concrete was poured even as close to the fighting front as Trier and at the Istein fortresses north of Basle, Switzerland.

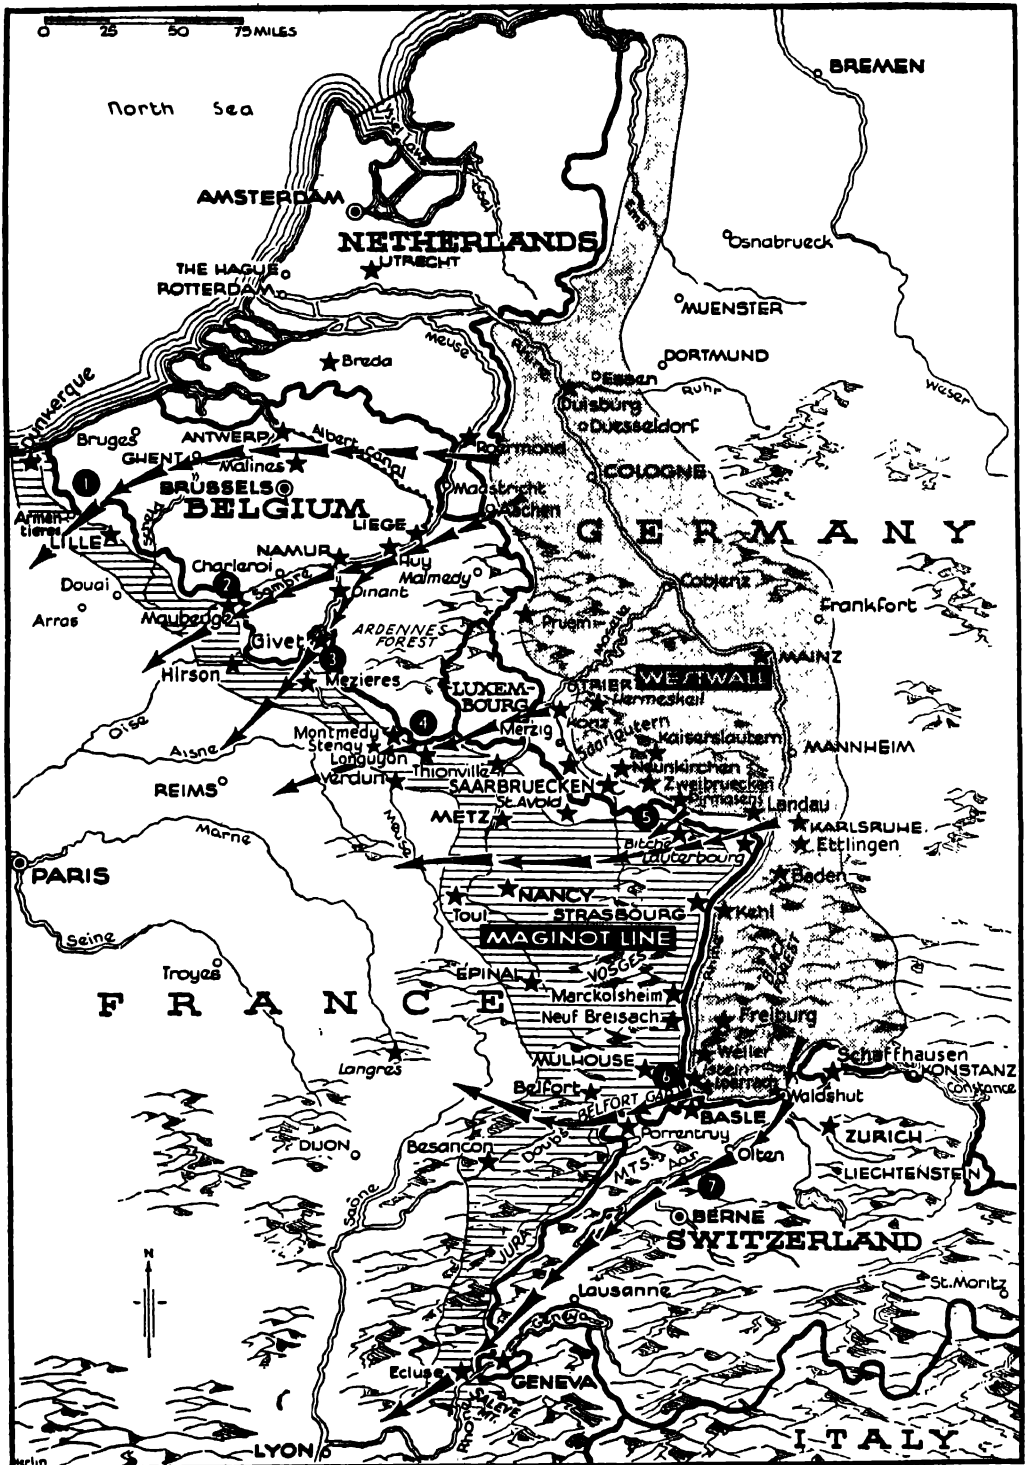

French Advance. Behind the cover of these vast lines the man power of the warring nations was mobilized. France set its somewhat cumbersome 21-day mobilization machinery into operation as its frontier cities and towns were evacuated and Britain prepared to send an expeditionary force to the continent, as Marshal Maurice-Gustave Gamelin, generalissimo of the Allied land forces, gave General Alphonse Georges, commanding the French field forces, orders to launch a diversion offensive intended to divert German troops from the Eastern Front and relieve the pressure upon hard-pressed Poland.

This offensive was cautious in the extreme; its lack of vigor may be explained in part by the fact that France was incompletely mobilized, by the time required to concentrate heavy and medium artillery near the zone of operations, by the memories of the World War with its wholesale bloody sacrifices; by French tactical doctrine, which has never adapted itself to a *Blitzkrieg* concept but is rather adjusted to the cautious, finely co-ordinated advance; by an announced desire for economy of life, and by the healthy French respect for the German Westwall.

In any case, the French diversion offensive was never really a large-scale co-ordinated offensive, but rather a series of local actions, which developed from reconnaissance in force, outpost and advanced guard bickerings, to local offensives. All of the French operations were restricted to that portion of the 110-mile German frontier between the Rhine and the Moselle; that section of the German-French frontier between Lauterbourg and Basle which has the River Rhine as its demarcation line, was, and has remained, quiescent.

The principal French effort was directed in the general direction of the 738-square mile German Saar, that rich mining and industrial area which lies squarely upon the French frontier, with its key city, Saarbrücken, on the border. Early French efforts were devoted to "feeling out" the "No-Man's Land" which lay between the Maginot Line and the Westwall, and to eliminating the geographical salients formed by the twisting frontier line. To this end, operations to the east and west of Saarbrücken were pressed most vigorously with local action as far west as Perl on the Moselle, and with the French probing deeply into the Bienwald in the Haardt Mountain Range, on the extreme east of the line.

These probing operations resulted in a slow

THE WAR AT SEA

Top: A convoy of Allied and neutral merchant vessels, guarded by British war-ships, off the British coast. *Center.* The German liner *Columbus*, set afire and scuttled by its crew 450 miles east of Cape May, N. J., on Dec. 19, 1939, to prevent its capture by a British warship. *Bottom:* The German pocket battleship, *Admiral Graf Spee*, scuttled on Hitler's orders in the estuary of the Rio de la Plata Dec. 17, 1939, after being forced to leave the harbor of Montevideo, Uruguay, where it was driven by three British cruisers in a sea battle on December 13.

and extremely cautious French advance, an advance which was opposed vigorously and yet without undue risk by the German Landwehr and reserve divisions, (bolstered by some regulars) who at first composed the bulk of the German troops on the Western Front. Land mines in profusion, tank traps, machine gun nests, and other obstacles, as well as the rolling, wooded nature of the terrain hampered the French advance. By the third week in September, about the time French mobilization was completed, this process had resulted in the establishment of a French outpost line—between the Rhine and the Moselle—most of which was on German territory, but which had not yet abutted squarely upon the first main line of resistance of the Westwall. The serrated line of the furthest French advance extended about as follows: From Luxemburg north of Perl, through the southern outskirts of Wehingen, north of Schwerdorf and Heining, roughly a short distance south of the south bank of the Saar through the middle of the Warndt Forest south of the outskirts of Saarbrücken, to Spichern to Ohrental, south of Hornbach, north of Schweiz, through the Bienwald on the right of the line to the Rhine.

Most of this line—which was in no sense the French advanced main line of resistance, but rather an outpost line—was on German soil. The maximum penetration of Germany was as follows:

In the Lauter sector, on a 15-mile front, one mile penetration into the Bienwald.

In the Haardt Forest, on a 20-mile front a two-mile penetration.

In the Hornbach sector on a 20-mile front a two-mile penetration in the direction of the towns of Pirmasens and Zweibrücken.

In the Saarbrücken sector, on a 15-mile front (the most active sector) a penetration of from $\frac{3}{4}$ of a mile to $1\frac{1}{4}$ miles.

In the Warndt sector on a 15-mile front, an eight-mile penetration into the Warndt Forest.

In the Nied sector, on a 20-mile front, a $2\frac{1}{2}$ mile penetration in the direction of the town of Saarlautern.

In the Moselle sector, on a 15-mile front, a three-mile penetration.

This advance never involved an offensive on a large scale, such as those to which the public became accustomed during the World War, but rather careful infiltration tactics, supplemented when the German resistance stiffened, by tanks—some of them the famous French "heavies" of 70 to 90 tons. Horsed cavalry was also used on both offense and defense for patrol and reconnaissance purposes.

The French advance forced the evacuation of a number of German border towns, and Saarbrücken was for long a dead city. Bubingen, Kleinblittersdorf, Bliessbach, Bebelshausen, Bliessmengen, and Auersmacher, sites of some of the richest Saar coal mine pitheads, were also reported evacuated and, there seems little doubt that mining and industrial activity in the Saar was materially reduced during the first six to eight weeks of war. On the other hand the French failed to capture any of the important parts of the Saar area; none of the major industrial centers was damaged either by shellfire or bombs; Saarbrücken, though for a time apparently within range of even light field artillery, was virtually unscarred, and the relative feebleness of the French advance, a feebleness attributable both

to lack of preparation for instant large-scale war and to a certain indecision in planning, contributed to the failure of the offensive.

But even a more vigorous offensive in the West in the first two weeks of war could not have saved the Poles, for as a study of the Polish campaign has shown, the German advance in the East was too rapid and devastating to be withstood. But whether or not capture or destruction of part of the industrial areas of the Saar might not have been a considerable contribution to the winning of the war for the Allies is a different question.

In any case, the French diversion offensive failed to divert—at least in time to help Poland. Germany actually commenced to transfer troops from East to West probably in the middle of September, certainly the Westwall divisions were considerably re-enforced by that date. And by September 21 masses of German troops from conquered Poland were being shifted to the West.

The French offensive, therefore, immediately bogged down. With Poland conquered a diversion offensive was pointless, and with the Westwall strongly manned by great masses of seasoned troops who actually outnumbered the effectives France could put into the front lines, a large-scale offensive of any sort was now extremely hazardous. France, therefore wisely assumed the strategic defensive, and by October 3, she had withdrawn her troops to a main defense line which ran almost entirely on French soil, but in front of the Maginot Line proper, leaving only the French outpost line—lightly held, within Germany. And soon the proud statements in the Paris press which accompanied the early and short-lived offensive—that "not a single German stands on French soil"—was to be contradicted.

German Offensive. For the Germans, in turn began a cautious advance, preceded by intensive patrol activity and artillery ranging early in October, and pushed back the small French outposts all along the line from the Rhine to the Moselle. Only in two instances—one east of the Moselle River on a four-mile front, where the French resistance was stiffer, and another in the Saarbrücken-Zweibrücken-Pirmasens sector—were offensives on any scale at all commensurate with the World War attempted. Three or four divisions were probably used in the first to overcome fairly stiff French resistance, and it was estimated that perhaps as many as 100,000 men or 8 to 15 divisions had been used in the second. The French, however, fell back to their previously prepared main line of resistance without making serious attempts to hold their earlier territorial gains, and at the same time punished the Germans with automatic arms and artillery fire.

The Germans halted their advance once their territory had been largely cleared of French troops, and except for sporadic thrusts at the Forbach salient which remained in French hands, displayed little activity.

Lines Stabilized. Thus, by the end of October, the lines in the West were stabilized about as they were at the beginning of hostilities. Despite intermittent reports of the massing of German troops on the Belgian, Dutch, and Swiss frontiers and of threats to these bordering neutrals (threats which were taken seriously enough in Belgium and Holland to cause increased mobilization, strengthening of defenses, and partial flooding), there was little or no activity on the fighting fronts—except incessant patrolling by

both sides—from November 1 until the end of 1939.

Neither side, however, was inactive. Of the 2,000,000 or so men that the Allies and Germany had concentrated on the Western Front by the year's end, perhaps no more than 1600 to 2000 a day were coming to blows during most of November and December. Each side sent out daily about 40 small patrol detachments of some 20 men apiece to patrol the dense woods, little river valleys and hills along the 118 miles of front between the Rhine and the Moselle. These men, using some of the tactics of Indian fighters—woods fighting, ambushes, etc.—reconnoitered along the border in the "No Man's Land" between the two main lines of resistance, and occasionally the armies conducted raids in force. Prisoners were taken daily, men died and men were wounded—but the armies stood still.

Both sides utilized the period of calm before the expected storm, not only in the battle of munitions behind the fighting fronts, but to enormously strengthen the defenses of the Maginot Line and the Westwall. The French closed the gaps in the Maginot Line; strengthened its somewhat weak flanks in front of the Belgian and Swiss frontiers, and to make security doubly sure, built a second line of strong field fortifications behind the tremendous fortresses of the Maginot Line. In the first three months of hostilities they strung 8350 miles of barbed wire; poured more than 1,000,000 cubic yards of concrete and used 100,000 tons of steel. The Germans also took advantage of the lull. On November 15—after the French-Italian tension that had accompanied the outbreak of war had definitely eased—the restricted zone ("Zone of Armies") that had rimmed France from the Channel to the Mediterranean was reduced in size and free access to the Franco-Italian border region was permitted.

British Troops Arrive. The small British Expeditionary Force that was quickly transported to France upon the outbreak of war included also excellent pick-and-shovel men; in fact the "Tommies" had little else to do in the first four months of war. (In December British divisions, under French command, took over a small sector of the front lines near Luxembourg.) The British were able to despatch six divisions, corps troops and corps staff almost immediately; the transportation of the 158,000 men, with full equipment and 25,000 vehicles was completed by October 8. Subsequently more thousands were shuttled across the Channel, mainly from Southampton to Cherbourg, and a large service of supply, rear area organization, base hospitals, etc., were set up, sufficient not alone to care for the first six divisions, but for a very considerably larger force expected in future months. The organization of Britain's land effort was under Sir Edmund Ironside, Chief of the Imperial General Staff, and the British Expeditionary Force in France was commanded by Viscount John Gort, known to his troops as "Tiger" Gort. Lt.-Gen. Sir John Dill commanded the 1st Corps of the B.E.F.; Lt.-Gen. Alan F. Brooke, the 2nd Corps.

The first Canadian division to go overseas—about 16,000 strong—a unit which may be the nucleus for a corps of Canadian troops, reached England (for further training) in December, under command of Maj.-Gen. A. G. L. McNaughton, while an Australian air squadron arrived later in the month, vanguards of the Dominions' marshalled forces.

The war in the West in 1939 was, therefore almost entirely a war of stalemate, a war of pickaxe, shovel, and training camp. In the small-scale fighting, there were no real surprises of a technical nature, although the large use by both sides of land mines and "booby traps" was not wholly expected. The Germans made some effective use of smoke shells for concealment of their movement and also tried out light body armor on some of their troops. Both sides evolved new methods of patrolling and both stressed cover, camouflage, concealment, and surprise.

THE WAR AT SEA

The war at sea is largely a story of statistics—statistics which tell the tale of victory or defeat. For the sea war is attrition war, guerrilla war—a vicious, hard, arduous, and protracted struggle—the war of blockade and counter-blockade. The nature of the struggle at sea had long been clearly forecast in the returns of the fleets, the technical data of tons and guns which revealed the enormous disparity between the mighty fleet of Britain, further strengthened by that of France, and the little fleet of the Third Reich, strong in submarines but weak in major surface craft and in no sense capable of meeting the Allied fleets in stand-up battle. Nor could the Germans hope to break the Allied blockade immediately imposed upon them; their recourse must be to weapons of speed, surprise, and stealth, to the submarine, supplemented by the plane, in attempts to clamp a counter-blockade upon Britain; to the surface raider, preying upon British commerce; to attempts to whittle down gradually by mine and torpedo and bomb the vastly superior fleet of the Allies; to attempts to create strategical diversions which would force the dispersion of that fleet. Germany, therefore, immediately upon war's outbreak, assumed a defensive naval strategy, coupled with opportunistic tactics.

The British Admiralty immediately utilized the vastly superior British surface strength to chase German commerce from the seas, to immerse in harbors all over the world, or to capture, German merchantmen; to cut off the arteries of trade which supplied the Reich with so many of her essential war materials.

With Winston Churchill quickly appointed First Lord of the Admiralty, and with Admiral of the Fleet Sir Dudley A. Pound as First Sea Lord, the Main Fleet (comprising most of the vessels of the Home Fleet, re-enforced) under Admiral Sir Charles Forbes, was immediately based on Scapa Flow, Cromarty, and the Firth of Forth and it has been in the last analysis this fleet with its great ships of the battle line that has kept the German Fleet close to its own coasts and made the British blockade possible. Vice Admiral Sir A. B. Cunningham had command of the Mediterranean Fleet at the outbreak of war.

The Reserve Fleet, fortunately mobilized prior to the opening of hostilities was a considerable reinforcement to the British Naval forces.

So, too, was the French Navy, under Admiral Jean Darlan, naval chief of staff, which—in the interest of unified command—was placed under the general direction of the British, just as the high command on land was vested in the French. The men-of-war flying the tricolor, divided into a strong Atlantic fleet and a Mediterranean squadron, provided important aid in holding the U-boat campaign in check, and the fast French light vessels, as well as the submarine cruiser

Surcouf, world's largest submarine and the powerful, fast battleships *Dunkerque* and *Strasbourg* were particularly useful in wide-ranging activities, operating against German commerce and defending Allied commerce against German surface raiders.

The German Navy, under Grand Admiral Erich Raeder was divided into North Sea and Baltic squadrons (which, however, could be easily merged through the connecting link of the Kiel Canal), and this unified fleet was apparently under the direct command of Admiral Wilhelm Marschall. This surface fleet, however, in the first months of war, played an inactive role, as the titanic struggle of the war at sea was primarily between the surface might of Britain and the submarines of the Reich.

The Allied Blockade. To add to the British Fleet strength, the Admiralty immediately commenced to convert suitable liners into armed merchant cruisers (50 vessels had been, or were being, so converted in November) and assigned a considerable number of them to the Northern Patrol, which took up the actual business of visit and search and blockade in that vast, tempestuous, uninviting stretch of water between the Hebrides and Iceland and Greenland and from the Orkneys to the Norwegian coast. At the same time the World War Dover Patrol was reconstituted; minefields were laid to block and protect the Strait and at other points along the coast to guard important harbors, and the blockade, quickly instituted, gradually increased in effectiveness as winter came and more and more British merchant and fishing vessels were converted to naval use, ran up the White Ensign and further augmented the power of what was already the largest fleet in the world.

Control ports for the examination of the papers and cargoes of neutral merchantmen were established; by the British, at Kirkwall in the Orkneys, Ramsgate (The Downs), Weymouth, Gibraltar, Malta, Haifa, Port Said, and Aden; by the French, at Dunkirk, Havre, Marseilles, and Oran, and the World War system of "navicerts"—or certificates issued to shippers in neutral countries designed to facilitate the passage of their goods through the blockade—was instituted in the late fall. Negotiations were also commenced with neutral nations bordering on Germany—primarily Holland—with a view to arranging import quotas and thus preventing goods from the outside world funneling through the neighboring neutrals to Germany in increasing volume.

In other respects the first months of the war

passenger liner *Athenia*—on the evening of September 3, only a few hours after Prime Minister Neville Chamberlain and Premier Edouard Daladier had accepted the gage of battle. The incident appeared to be, in many respects, another *Lusitania*, for many American refugees from the war were on board and 30 of them, together with some 82 other nationalities lost their lives. The explosion that sank the *Athenia* was sudden and without warning, but the American public received the news calmly and the incident only added to the desire of public opinion in the United States for neutrality. (Germany has continuously denied that any of her vessels caused the loss of the *Athenia*.)

German submarines, with some few exceptions, at first observed the rules of international law, and stopped and warned ships before destroying them, putting their crews in places of safety wherever possible. Their toll in the first weeks of war was relatively high since many British ships were caught upon the high seas at the start of hostilities and had to run the gantlet to port.

The British answer to submarine operations was to employ immediately the technique it took them three years to learn in the World War—the convoy system. This system was fairly well established for the most important trade routes within three to six weeks after war started. Merchantmen were herded together into groups at Halifax, Sydney, and Gibraltar and escorted to ports in Britain and France by destroyers, escort vessels, sometimes by heavier vessels, and when near land by long-range patrol planes. Britain also gave another answer to the German submarine war; she laid minefields—both in the Straits of Dover and off the German coasts; she established destroyer patrols, armed trawlers and drifters and sent them out on anti-submarine patrol, and she armed her merchantmen (more than 1000 had been so equipped by the year's end), both with anti-submarine and anti-aircraft guns.

The defensive measures against the submarine were thus adopted much more quickly than they were during the World War, although Germany's submarine campaign was started immediately upon the outbreak of war, much sooner than it commenced 25 years ago. The German counter-blockade of Britain seemed for a time in the first six weeks of war to be making fair—though not dangerous—progress, but the defensive measures taken lessened its effectiveness during October and the first part of November, but losses mounted again in December and a seesaw battle

MERCHANT SHIPPING LOSSES, 1939

| Country | September | | October | | November | | December | | Grand Total | |
|---------------|-----------|---------|---------|---------|----------|---------|----------|---------|-------------|----------|
| | Number | Tonnage | Number | Tonnage | Number | Tonnage | Number | Tonnage | Number | Tonnage |
| Britain..... | 31 | 148,713 | 19 | 85,038 | 34 | 91,882 | 46 | 128,602 | 130 | 454,235 |
| Neutrals..... | 15 | 35,260 | 17 | 48,410 | 16 | 83,363 | 44 | 115,080 | 92 | 282,113 |
| France..... | 1 | 2,660 | 4 | 36,312 | 5 | 10,066 | 1 | ? | 11 | 49,038? |
| | 47 | 186,633 | 40 | 169,760 | 55 | 185,311 | 91 | 243,682 | 233 | 785,386? |

Daily average sinkings during first four months of European War, 1939—194 ships, 6,544 tons. Daily average sinkings during first four months of World War, 1914—2,200 tons. Daily average sinkings during first four months of unrestricted World War submarine campaign, 1917—21,762 tons.

at sea closely paralleled the blue-water procedure of the World War.

Submarine Warfare. Germany, throttled on the surface, struck quickly under the surface; her submarines, already at sea when war began, apparently claimed their first victim—the British

was begun between the submarine (assisted by the plane) using its weapons—the torpedo, the mine, and the gun—and the defense forces, a battle in which first one, and then the other, appeared to have the advantage.

Shipping Losses. The statistics of this war

at sea in which tons sunk may spell victory or defeat are shown in tables on pages 243 to 245.

The British *gross* mercantile losses were materially reduced by intense work at the shipyards, by capture of German merchantmen, by purchases and chartering of ships of other nationalities.

In early December it was estimated by Mr. Churchill that Britain's net losses (arrived at by deducting from gross losses the tonnage of captured German ships, the tonnage of ships chartered or purchased from other nations, the tonnage of new ships built) were only 60,000 tons. At the end of December, the British naval attaché in Washington issued a statement in which it was calculated that Britain's net losses had averaged only 500 tons a week for the first 16 weeks of war, a figure which apparently was difficult to reconcile with Mr. Churchill's statement of a few weeks earlier. Nor did the optimistic British statements take sufficient account of the fact that shipping losses, whether to neutrals or Allies, represented a net drop in the world tonnage totals, which could not be replaced by transfer of ships from flag to flag. Nevertheless, it was apparent at the end of 1939 that the German counter-blockade would have to be made far more effectual and the rate of ship sinkings increased perhaps 200 to 300 per cent before a danger point was reached.

German merchant ship losses in the first four months of war totalled about 21 ships of 122,299 tons, increasing the world tonnage loss to 254 ships of 907,585 tons. Most of the German vessels were scuttled to prevent capture; several were sunk by British shellfire after their crews had been removed. In addition to these losses the Allies captured about 20 German merchantmen of almost 100,000 tons in the first four months, bringing Germany's total merchant marine tonnage loss to 222,000 tons. The largest and most important loss to Germany was the liner *Columbus*, 32,581 ton ship, intercepted by a British destroyer 450 miles off Cape May, N. J., on December 19 and scuttled by her own crew to prevent capture. She had been trying to run the blockade from Vera Cruz, Mexico. More successful was the *Bremen*, which left New York a few days before war was declared, successfully eluded British cruisers and reached Murmansk, Russia. In December the *Bremen*, following Norwegian territorial waters most of the way, slipped back to Germany. Some of the most important Allied and neutral losses were the Polish liner *Pilsudski* (under charter to the British) apparently torpedoed, November 26; and the Japanese liner, *Terukuni Maru* of 11,930 tons, sunk November 21. No U. S. ships were sunk.

An unknown number of German submarines were sunk by Allied anti-submarine measures; the crews of some were captured; combined British and French claims estimated that from 30 to 45 U-boats had been destroyed in the first four months of war, a total probably more than twice as large as the actual losses. Moreover German U-boats were being built at high speed as replacements, although it was not until the year's end when shipyards at captured Danzig, Gdynia, and elsewhere added their quotas to the high-speed output of German yards that the German submarine output apparently commenced to reach peak capacity. This construction capacity was, of course, a closely guarded secret, but there was reason to believe it could equal or excel

the World War construction average of 6.6 new U-boats a month, a rate probably in excess of the average monthly rate of U-boat losses.

Nevertheless British measures made it more difficult for the submarine to find suitable targets; the losses of unconvoyed and unprotected neutral ships quickly reached a figure out of proportion to British losses, and sinkings of British vessels dropped from 64,000 tons in the second week of war to 5000 tons in the sixth.

In mid-November, the Germans supplemented their warfare against merchantmen by adding another weapon—the mine—to those heretofore used—the torpedo and the gun. German submarines—and, for the first time in any war, German planes—laid mines, apparently of a new and more sensitive type, in the Thames estuary and close to the British coast. For a time, largely because of obvious British unreadiness to meet such a measure (the mistress of the seas apparently had less than 200 minesweepers in commission, as compared to some 2500 of this general type at the end of the World War), the mine-laying campaign increased shipping losses materially. However, again the defense mobilized its resources; trawlers and their crews were hastily recruited for minesweeping duty; balloon barrages were made amphibian and extended to the waters around the Thames, and in the last week of December, the Admiralty announced plans for laying a gigantic minefield—the largest ever projected—in a 500 mile belt 30 to 40 miles wide from the Orkneys to the Downs off the Eastern British coast to protect coastal shipping lanes against minelaying and submarine excursions. Thus, within four months of war, the British had already initiated two projects which they did not commence in the World War until 1917–18—the convoy and then the interdicting minefield—which proved 21 years ago to be the two most efficacious anti-submarine measures tried.

And the British answered the German mine campaign in another way—by extending the British blockade to German exports as well as to imports, another measure that was not taken in the World War until the latter years.

Surface raiders, highlighted briefly by the activities and dramatic end of the *Admiral Graf Spee*, were another menace to which a defense had to be found. During her three months or more of preying upon British shipping around the Cape of Good Hope, the *Spee* sank some nine ships. By far the greatest losses, however, were caused by the submarine torpedo and the submarine and aerial mine, as the following table shows:

CAUSES OF MERCHANT SHIP LOSSES, 1939
(German losses not included)

| Cause | Number | Tons |
|-------------------------------------|--------|---------|
| Submarines | 79 | 348,844 |
| Mines | 82 | 252,198 |
| Raiders (surface) | 10 | 55,133 |
| Air attack | 9 | 2,797 |
| Miscellaneous and unknown | 53 | 126,314 |

Note: The high ratio of mine to submarine sinkings is noteworthy and represents some departure from the experience of the World War. The losses by air attack—bombs and machine guns—were also far higher proportionately than World War figures when only 7,900 tons of commercial shipping, mostly fishing vessels, were sunk by aircraft during the entire war.

Economic Effects of Blockades. Blockade and counter-blockade had immediate effects upon both Britain and Germany, but the warfare at sea caused very little dislocation of French econ-

omy. An estimated 800,000 to 1,000,000 tons of goods allegedly destined for Germany were intercepted and detained as contraband in the first four months of war, and Allied sources believed that in less than four months of war more than 10 per cent of Germany's annual normal imports had been cut off, an amount which—it was estimated—would increase to 40 per cent over a period of a year of war. Germany's food rationing system, already in effect at the outbreak of war, was drastically tightened, and in none of the warring countries was gasoline procurable to private purchasers except in limited amounts and with special permissions. England announced in December that bacon, ham and meat, butter, and sugar would be rationed commencing in January, and British trade fell off sharply. Imports shrank by one-third and there was a 42 per cent drop in exports in September compared to September, 1938, but as the convoy system started to work smoothly trade with much of the outside world became more nearly normal.

Naval Actions and Losses. The other, and perhaps the more important, phase of the war at sea was the guerrilla struggle between the men-of-war of the three nations. Unable to meet the British fleet in a stand-up battle, the German Navy adopted the tactics of surprise and stealth, knowing that if it was successful in whittling down the strength of the British surface fleet to a size commensurate with its own, the British blockade was broken and the war won. The particular targets of the German submarines and planes were the 15 British capital ships (11 battleships and 3 battle cruisers) with which Britain started the war, for it was upon these ships primarily that British superiority at sea rested.

In this campaign Germany was successful in sinking one and in damaging at least one other of these ships in the first four months of war. On October 14, Lieutenant Gunther Prien took his U-boat into the supposedly secure harbor of Scapa Flow, where a large section of the British main fleet was based, and sank the battleship *Royal Oak* with three to five torpedoes. The feat was almost repeated, apparently by another German submarine in November, which about the 22nd, penetrated the defenses of the Firth of Forth and damaged the new 10,000-ton cruiser *Belfast*.

Late in December, about the 28th, a battleship of the *Queen Elizabeth* class, probably the *Barham*, was torpedoed at sea, and sometime during the first months of war, the battle cruiser *Repulse* was damaged slightly though the British said the damage was not suffered in battle. The British suffered another major loss when the aircraft carrier *Courageous*, first man-of-war to be lost by Britain, was torpedoed and sunk on September 17. Some of these losses—particularly that of the *Royal Oak*—were undoubtedly partially due to some inefficiency or inadequacy in British naval preparations, and for a time many believed that the British "muddling-through" policy of the World War was again being repeated.

November and December furnished two of the most dramatic incidents in the war to date. On November 25 a German "pocket battleship," apparently the *Deutschland*, accompanied by a cruiser identified as the *Emden* was sighted off Iceland by the British *Rawalpindi*, an armed merchant cruiser with six-inch guns assigned to the Northern Patrol. The 11-inch guns of the German vessel poured a murderously accurate

fire into the outclassed British vessel, whose crew fought her till all guns were out of action. The German man-of-war and her consort disappeared in the northern mists before British reinforcements could arrive and the *Rawalpindi*, ablaze from stem to stern, sank with the major portion of her brave crew.

Sinking of Graf Spee. On December 13 occurred one of the strangest battles in naval history. The German "pocket battleship" *Admiral Graf Spee*, which had been raiding British commerce since the war's beginning and had sunk nine vessels, was sighted off Uruguay by the British eight-inch-gunned cruiser *Exeter*, which quickly called two six-inch-gunned cruisers—the *Ajax* and *Achilles*, to her assistance. In the ensuing action, the three lighter but faster British men-of-war under Commodore H. H. Harwood stuck to the heels of the *Graf Spee* throughout a day-long running fight, using smoke screens and hit-and-run tactics to nullify the heavier weight of metal of the German. The *Exeter* was hit so heavily by the 11-inch guns of the German

NAVAL LOSSES, 1939

| British Ships Lost | Tons |
|--|--------|
| <i>Royal Oak</i> , battleship | 29,150 |
| <i>Courageous</i> , aircraft carrier | 22,500 |
| <i>Rawalpindi</i> , armed merchantman | 16,697 |

| Unidentified | Canadian Destroyer |
| <i>Kithwake</i> | Patrol Vessel |
| (Ten to twenty trawlers and drifters that may have been utilized as naval auxiliaries were also damaged.) | |
| Total—15 ships. | |

| French Ship Lost | Tons |
|--|-------|
| <i>Pluton</i> , minelaying cruiser | 4,773 |
| Total—1 ship, 4,773 tons. | |

| German Ships Lost | Tons |
|---|--------|
| <i>Admiral Graf Spee</i> , armored ship | 10,000 |
| <i>Esté</i> , patrol boat | 400* |
| Unidentified patrol boat | 400* |

Fifteen to 35 submarines, most of them probably from 500 to 740 tons, may have been destroyed. Some Allied claims are even higher than this number, but the Germans have admitted the loss of only a very few, and it is probable that no more than 15 to 20 have actually been sunk, although others may have been damaged.

Total—18 to 38 ships, 19,500 to 32,800 tons.

| German Ships Damaged | Tons |
|--|------|
| One light cruiser of <i>Königsberg</i> class | |
| One light cruiser of the <i>Leipzig</i> or <i>Königsberg</i> class | |
| One heavy cruiser of the <i>Blücher</i> class | |
| Total—3 ships. | |

* Believed seriously damaged. * Approximate tonnage

she was forced out of the action, and the *Ajax* was also hit but the *Graf Spee* was in turn hit, and about midnight sought refuge in Montevideo with holes along her waterline, in her bow and fire control tower and with 36 dead and 60 wounded. The *Exeter* suffered 61 dead and 23 wounded; the *Ajax* 7 dead, 5 wounded; and the *Achilles*, peppered with shell splinters, 4 dead and 3 wounded.

Given until the afternoon of December 17 to leave port or be interned, Capt. Hans Langsdorff of the *Spee* took neither alternative, but on the 17th, acting on direct orders from Hitler in Berlin, took the "pocket battleship" out of the harbor, and scuttled and destroyed her in the River Plate, while the *Ajax*, *Achilles*, and at least one other British warship waited outside. Interned with his crew in Buenos Aires Captain Langsdorff committed suicide three days later, and was hailed as a hero in Berlin. The scuttling of the *Graf Spee*, however, following her fight with the British cruisers and her retreat into port, was elsewhere hailed as a British victory—the most dramatic one and the first clear-cut one of the war—and in the world's opinion German morale suffered a considerable blow.

British seamen also struck another blow for England on December 13 and 14 when a British submarine, the *Ursula*, the Admiralty claimed, torpedoed a cruiser of the *Königsberg* class in the Elbe River (the British claimed she was sunk, but this is unlikely), and another submarine, the *Salmon*, fired torpedoes at another German 6000-ton cruiser of the *Leipzig* type at sea, and also at a 10,000-ton cruiser of the *Blücher* class, both of which, according to the British Admiralty, were damaged. The Germans denied all these claims.

THE WAR IN THE AIR

One of the most surprising features of the first four months of war was the relative inactivity of the aerial fleets. Both governments and peoples had expected early and ruthless bombing raids upon both military and non-military objectives—but except in the conquest of Poland, where a large part of the German air fleet was used with devastating power—the planes of both sides were held strictly in leash and were used only for limited objectives—not in the "all-out" war that had been so freely predicted.

From the Allied point of view this policy was undoubtedly the correct one, since at the start of war the German flying fleet was far better prepared for an "all-out" conflict than were the Allies, and German factories had a replacement rate probably superior to both Britain and France combined. And a period of relative quiescence in the air would enable the Allies in time, with American help, to overtake the German lead.

It was less easy to understand why the Reich did not undertake more energetic air operations, once the Polish campaign was completed and Hitler's subsequent bid for peace was rejected. There are several possible military reasons (although it is probable that political factors were of more importance than military ones). One was the lateness of the season; had an aerial campaign against Britain been started, the execrable flying weather of a Western European winter would have prevented a continuous, uninterrupted campaign. Another was Germany's own vulnerability to aerial bombing, and her knowledge that her heavy industries in the Ruhr (only 30 to 40

minutes flying time from French bases) and in the Saar (on the French border) would be heavily bombed in this horrible game of tit-for-tat. Still another, and perhaps the most important reason was the probability that the Reich would gain by time; that the production rate of her aircraft factories—high, but not producing at maximum wartime capacity on September 1—would increase faster than the increase in British, French, and American factories combined—until sometime in 1940—probably late spring.

Regardless of the reasons the air arm did not play its expected part in the first months of war—although its accomplishments, judged against the yardsticks of past wars, were considerable.

British Activities. The British dramatically struck the first blow on September 4 (while the Germans were busy in Poland) sending a number of Bristol Blenheims and Wellington bombers over the Kiel Canal on a raid against the German fleet. Claims were variously made that a "pocket battleship" or a battleship of the *Scharnhorst* class had been badly damaged, but this was denied by the Germans and from a careful weighing of the censored evidence, seems improbable. The British lost a considerable number of the planes sent on the raid; in fact the raid apparently was so costly that no other bombing attempts of the kind were made for weeks.

During September and October the British contented themselves with far-flung reconnaissance flights over Germany—many of them photographic missions, many for the purpose of dropping propaganda pamphlets. Both Britain and France were much criticised for failing to send "shuttle bombing raids" across Germany during the Polish campaign, or to despatch planes to base on Polish airfields and to operate against the German Army. But neither England nor France had enough planes to spare for any such purpose; moreover it would have been impossible to base any considerable number of British or French planes on Polish fields, due not alone to the speed of the German advance, but particularly because of the lack of adequate base facilities, mechanics, spare parts, gasoline, bombs, or ammunition to service such planes. Polish flying fields were not really adequate to support the Polish flying force, let alone any considerable increment to its strength.

The Royal Air Force, under Air Chief Marshal Sir Cyril L. N. Newall, was divided at the outbreak of war into three principal combat commands—Fighter Command, Air Chief Marshal Sir Hugh C. T. Dowding, commanding; Bomber Command, Air Chief Marshal Sir Edgar R. Ludlow-Hewitt, commanding; and Coastal Command, Air Marshal Sir Fred. W. Bowhill, commanding. A section of the Fighter Command, and apparently also of the Bomber Command, was early established in France (and were supplied by air from England for almost two weeks) with the British Expeditionary Force, and some of these Royal Air Force planes were specially earmarked for army co-operation, photographic and land reconnaissance work. The planes based in France were later put under a unified command answerable to Viscount Gort. Of all the commands the Coastal Command was most active, its planes (mostly long-range flying boats) flying more than 1,000,000 miles a month on reconnaissance, anti-submarine and convoy patrols and carrying out some 60 attacks against German submarines.

French in Action. The French Air Force under Gen. Joseph Vuillemin conducted some reconnaissance flights over Germany (both Britain and France mapped practically the entire German Westwall from the air), but its bombing squadrons saw little action. Fighter pilots were busy above and near the land fronts in October, November, and to a lesser extent in December—the reconnaissance and photographic flights invariably coinciding with a burst of brief but spectacular aerial combat between German and French (and occasionally British) fighters. In these combats, the American-built Curtiss Hawk 75-A, single-seater, low-wing fighters powered with Pratt and Whitney engines and armed with four or six .50 caliber machine guns, demonstrated their maneuverability and high rate of climb in combats with the much-touted single-engined German Messerschmitts and were clearly among the outstanding planes on the Western Front in the early months of the war. In these combats apparently two Messerschmitts were shot down for every Curtiss lost. The British Hawker Hurricanes, most of them held at home against the threat of German raids, also proved excellent combat planes.

German Air Strategy. After disposing of Poland, the German Air Force, its four fleets commanded by Generals Kesselring (First Air Fleet), Felmy (Second), Sperrle (Third), and Löhner (Fourth), commenced a series of long-range reconnaissance and bombing flights over British fleet bases in Scotland, the Orkneys, and the Shetlands. The first of these on October 16—over the Firth of Forth—apparently caught the British by surprise for no air raid alarm was sounded, and although only a few planes participated in the raid the cruiser *Southampton* was struck and slightly damaged, and a number of casualties were suffered aboard the cruiser *Edinburgh* and the destroyer *Mohawk*. The *Mohawk's* captain, Commander R. F. Jolly, wounded in both legs, had himself propped up in a chair, directed his ship's antiaircraft fire against the raiding planes and coned his ship to her pier, dying as she docked.

The next day German planes raided Scapa Flow, damaging slightly the old battleship *Iron Duke*, now used as a training ship. Successive raids by relatively small numbers of planes followed, and later in the year a particular target were the harbors of the Shetlands used as British seaplane bases and as bases by the blockading squadrons of the Northern Patrol.

The British Fleet at sea, as well as in port, was the target of German planes, and on September 26, a squadron of British capital ships, an aircraft carrier, cruisers, and destroyers were attacked by about 20 planes in what Berlin described as "the first successful action of its kind in military history." Subsequently throughout the autumn and early winter British men-of-war in the North Sea were frequently attacked from the air in the first considerable wartime tests of air power versus sea power. The Germans claimed the sinking of the aircraft carrier *Ark Royal* (a bomb apparently exploded close alongside the carrier and may have caused some slight damage) and later said their planes, aided by their fleet, "controlled the North Sea"—a bombastic and spurious statement.

Except for the early raids against British bases when the British air defense (conducted in the Firth of Forth area largely by the Auxiliary Air

Force) was none too strong, British reaction was prompt, vigorous, and effective. Defending pursuit or interceptor planes were able, because of the small number of planes used by the Germans in each raid (never more than 12 to 15 over naval base areas; sometimes as many as 20 or a few more against ships at sea) to "gang up" against the Germans and in this way to shoot down a rather high proportion of them, while at sea the heavy antiaircraft armament of the men-of-war (particularly the multiple-barrelled pom-poms) kept the bombers at rather high altitudes and distracted their aim.

Thus, the early tests of air power versus sea power while in no sense decisive of the broad problem posed by such warfare (since the raids were on too small a scale and were often made by flying boats or older type German planes) produced few material results, except in the first two raids, and did not alter the basic strategic situation in the North Sea. There was some evidence, however, that the British Fleet—out of respect for air power—was keeping a more distant blockade of the German Coast than the small strength of the German surface navy would warrant.

In addition to actual bombing raids German planes—usually Heinkels or Dorniers—carried out long-range reconnaissance flights over both Britain and France, but particularly over Britain, photographing objectives as far west as Liverpool. These flights were persistent, but in no great force.

Still another important use of the plane, but again one on too small a scale to permit deductions, was its employment by the Germans in an attack against a North Sea convoy of merchant ships. Extensive attacks from the air against merchantmen had been expected, particularly when the submarine campaign slowed up, and British merchantmen were armed with anti-aircraft as well as anti-submarine guns, but the attacks made were few and sporadic and the Germans apparently suffered heavy losses without material result.

By far the most effective use of German planes (outside the campaign in Poland) was made in late November and December, when aerial mine-layers (mostly seaplanes)—the first used in any war—supplemented the efforts of German mine-laying submarines and laid mines in the Thames estuary and other areas off the British coast. Later the Germans commenced a determined attack upon the British fishing fleet, bombing and machine-gunning numerous trawlers. Both of these assaults, difficult to combat and launched by surprise, caused at first considerable losses, but defensive British measures, coupled with commencement of a more vigorous British aerial counter-offensive checked them before the year's end. British planes attacked seaplane bases in the Frisian Islands and maintained a constant aerial patrol off those islands. Their aggressiveness was, however, in turn checked in December, when one large-scale raid sustained severe losses when attacked by a large number of twin-engined German Messerschmitt interceptors, armed with quick-firing cannon.

Results of Air Warfare. Thus the war in the air in 1939 ended on a note of frustration for both sides, with neither having a clear-cut superiority. Despite the more or less continuous aerial activity, interrupted only by bad weather, it was obvious that the air arm had been held

strictly in leash by both sides (from Germany came unconfirmed rumors of disagreement in the High Command partially about this policy; in England, *The Aeroplane* openly criticised what it termed the inefficient and inadequate use of the air force and said it was hampered by the two older fighting services). Thus, no comprehensive conclusions were possible, although certain limited and tentative ones were drawn, viz:

In fighting plane versus fighting plane the value of high speed seems to have been overemphasized as particularly exemplified by the successful and spectacular battle between nine French Curtiss single-seater fighters on November 6 against 27 faster but less maneuverable German Messerschmitts.

Bombing at extreme distances—the 1000 to 1200 miles from the Reich to British naval bases and return—is a major problem, technically, tactically, and in organization and supply.

The war may force the development of a new type of plane—the long-range pursuit ship, capable of accompanying and protecting the bomber on distant raids.

Long-range patrol planes were extremely useful in the anti-submarine campaign and also simplified, and improved the effectiveness of, the British blockade.

As the year ended it was apparent that each side had completed all exploratory and reconnoitering flights necessarily preliminary to any large-scale aerial effort, and that each was girding itself for that tremendous aerial offensive—so long expected and so long delayed.

Despite the inconclusive results obtained by the plane in the opening months of war—results which had little effect upon the course of the war—the fear of the plane—particularly fear of its unrestricted use against cities and civilians—permeated the war efforts of all belligerents, and in no previous war in history have such gigantic efforts been made on the Home Fronts. Principal cities of all combatants were blacked out at night, with a consequent depressing effect upon morale, and hundreds of thousands of troops, civilians, and semi-civilians (about 1,250,000 in Britain alone) were kept constantly in readiness for warning systems, air raids precautions work, manning anti-aircraft guns, etc. Thousands of anti-aircraft guns and searchlights, hundreds of defending fighting planes, and millions of dollars worth of other equipment were utilized in these defensive systems. Governments, for the first time in history, made their major war efforts upon the

Home Fronts, and the civilization of Western Europe burrowed underground against the terror from the skies.

THE RUSSIAN FRONT

The Baltic States. Flushed with her share of the spoils in Poland, Soviet Russia, following the policies of the Czars and pushing westward to the Baltic, quickly became a major factor—perhaps the most important single factor—in the War of 1939. Russia immediately exerted pressure upon the small Baltic states—Latvia, Lithuania, and Estonia—and following the voluntary withdrawal of German influence from these states, exacted a series of treaties during October which made these tiny nations virtual appendages of the Soviet giant, and gave Russia naval and air bases on the Baltic. During October and November Russian troops were garrisoned in the three countries and Soviet warships and planes based on Estonian and Latvian harbors. Naval and air bases at Libau, Windau, Tallinn, Baltic Port, Dagoe, and Oesel Islands and elsewhere, and a coast artillery base between Ventspils and Pitrage (Latvia) were established.

Attack on Finland. Russia then commenced to exert pressure upon Finland, demanding certain islands in the Gulf of Finland and other territorial concessions. Protracted negotiations reached no agreement, and after a period of relative diplomatic quiet, Russia suddenly turned the threat of force into the use of force, and on November 30 started an undeclared war against little Finland.

Russian planes, operating from Leningrad and the newly-won Estonian bases, bombed Helsinki and other towns; the Russian fleet opened a bombardment of Hangoe and other ports, and the Red Army pushed across the frontier at 8 a.m. The air invasion, sporadic and feeble, caused considerable initial damage and loss of civilian lives in Helsinki, but was militarily ineffectual. The sea attacks were equally purposeless and the Finnish coastal batteries gave far better than they got damaging in one of several engagements the new Russian cruiser *Kirov* and damaging or sinking a Russian destroyer. The Russian Navy, however seized the islands in the Gulf of Finland Russia had previously demanded from the Finns—Hogland, Pittesari, Rovansaari, and Seiskari—all of which were evacuated and undefended by the Finns. But the principal fighting quickly developed along widely-separated points of the 955 mile frontier with Russia, and it was soon apparent that the Russian bear had gotten hold of a tartar.

Soviet Strategy. The first and principal offensive was initially launched against the 70-mile wide neck of the Karelian Isthmus, where the Finns had established a line of field fortification and concrete pillboxes, known as the Mannerheim Line (from their generalissimo, Baron Kar Gustav Mannerheim) between Lake Ladoga and the Gulf of Finland. The Russian forces too! Terijoki near the border, set up what they called a Finnish Communist state, and pushed a few kilometers into Finland until they approached the outposts of the Mannerheim Line. Against this line Russian forces, growing in strength in numbers, battered without making any appreciable progress until the end of the year, striking first across the Taipale River, then along the coast, then across the frozen surface of Lake Ladoga in an obvious attempt to seize Viipuri.

CASUALTIES AND LOSSES IN THE WEST (Exclusive of Poland, September, 1939 to Jan. 1, 1940)

| Country | Dead* | Country | Planes lost* |
|--------------|-------------------|--------------|--------------|
| Germany..... | 4000 ^b | Germany..... | 150 to 275 |
| Britain..... | 2600 ^c | Britain..... | 100 to 200 |
| France..... | 1500 ^d | France..... | 80 to 150 |
| Total..... | 8100 | Total..... | 330 to 625 |

* Figures include all dead in land, sea and air forces of the three powers, but do not include wounded, missing or prisoners, and do not include civilian casualties.

^b Only official announcement of German casualties in West was one of October 17, in which 196 dead, 356 wounded, 114 missing, were announced in fighting along Western Front. *Graf Spee* lost 36 known dead; 114 U-boat prisoners were known to be held in England.

^c Paris announced on December 26 that 2511 British soldiers, sailors and fliers had lost their lives since the war began, only 3 of them on the Western Front.

^d Paris announced on December 26 that 1434 Frenchmen had been killed since the war started.

* Battle losses only.

RUSSO-FINNISH WAR, 1939

This map shows Finnish territories occupied by Russian troops during 1939, the areas retaken and taken by the Finns, the status of the various fronts as of December 31, and the major lines of communication of both Finnish and Soviet armies.

and southern Finland, but all in vain. The base for this attack was, of course, Leningrad.

A second push just to the north of Lake Ladoga, obviously launched with the intent of outflanking the Mannerheim Line, and also based upon Leningrad, crept for a time around the northern edge of the lake toward the important rail junction of Sortavala. A flank of this drive early seized Tolvajärvi and Suojärvi, easternmost Finnish railheads, and drove toward the railroad junction of Joensuu, but a strong Finnish counterattack checked this threat before the end of September, sent the Russians reeling back toward Suojärvi, and later, at the year's end, inflicted a severe defeat on the invaders at Aglaejärvi.

Further north another drive developed from Repola toward Nurmes; still another one from Kem on the Leningrad-Murmansk railroad as a base toward Suomussalmi and thence across Finland's "wasp waist" toward Uleaborg, on the Bothnian Gulf; and a third one southwest from Kandalaksha toward Salla, Kemijärvi and Tornea at the head of the Gulf of Bothnia. This three-pronged effort was obviously intended to cut Finland in two and to cut off the rich southern portion with its industries from Sweden by cutting the single railroad, passing through Uleaborg and Tornea.

Russian Defeats. For a time this effort appeared singularly successful; the Russian penetration was deep, and Russian advance forces

pushed past Suomussalmi which they used as a base to Hyrynsalmi, and to Lake Kianta. The Finns allowed them to push out around the lake; then cut their lines of communications, surrounded and attacked the trapped Russians, after allowing the bitter below-zero weather to do its work. The result was a very considerable Finnish victory; on December 29 and 30 the 163rd Red Army Division of some 18,000 men was badly cut up, and it was estimated that many thousands of Russians were killed, wounded or captured. Thus, the two southern prongs of the Russian attempt to cut Finland in two were successfully turned.

Further north, the Finns checked another prong of the drive across their country's middle portion by the same tactics—allowing the Russians to push deep into the inhospitable heart of a desolate country in midwinter, thus attenuating their supply line, and then harassing and attacking them. Fierce fighting occurred east of Kemijaervi, after the Russians had penetrated 67 miles from the Russian frontier, but it ended, even before the Lake Kianta debacle, in a withdrawal to the Salla region, where fighting was in progress as the year ended.

The same story was repeated in the extreme north where Russian land, air, and sea forces, based at Murmansk, attacked the Finnish ice-free port of Petsamo on the Arctic Ocean and finally took it, then pushing southwards toward Nautsi, 70 miles south of the Arctic, which they reached after several weeks' effort, only to retire precipitately with considerable loss and abandonment of much equipment to the Finns as their supply line failed. The exact battle front in the north at the year's end was uncertain, but apparently the Russians were consolidating their forces near Salmijaervi, the abandoned Finnish nickel center near the Norwegian border.

This remarkable series of Finnish successes were due to a variety of causes, chief among them poor organization of the Russian service of supply; Russian military ineptitude and overconfidence; the great difficulty of the Finnish terrain, seamed with lakes and rivers, covered with forests, ideal for the 200,000 ski-equipped Finnish militia, who used their own particular guerrilla methods, light automatic rifles, and short deadly daggers ("puukos") with telling effect. The awful effects of the bitter sub-zero cold, the perpetual Arctic night and the deep snow, also contributed materially to the Russian reverses, and even in the south, where the well-equipped Finnish Regular Army of some 190,000 (war strength), organized in six to ten divisions, held the Mannerheim Line and the area north of Lake Ladoga, the Russian masses were unable to make any appreciable impression.

Situation at Year End. First attacks, however, were probably not made in any such mass as was preliminarily reported; probably only the nine or 10 divisions normally stationed in the Leningrad Military Area were used (with attached units), totalling some 300,000 to 400,000 men. The Russians obviously expected to overawe the Finns by air raids and naval and land attacks; when the opposition stiffened more troops were mobilized, so that by mid-December it was estimated some three divisions or more were in the Murmansk-Petsamo sector; another corps of three divisions with much mechanized equipment was based at Kem; four divisions north of Lake Ladoga, and six to 10 in front of the Mannerheim Line—a total of perhaps 20 divisions. By the year

end the Russian strength had probably grown to 800,000 men; more men were being mobilized; a Soviet "hero," Gen. G. M. Stern, who won a reputation in the Far East, had been assigned to command the bogged-down Russian campaign, and Stalin was obviously determined to press the offensive and save the face of the Red Army.

On the other hand, although the major part of the fighting was still on Finnish soil, the Finnish counterattacks had everywhere been successful (except along the Karelian Isthmus where the lines were stabilized) and Finnish ski patrols had crossed the Russian border and were reported to have damaged at a number of points the single-track Leningrad-Murmansk railroad, vital supply line for the Russian northern armies. Moreover world public opinion was mobilized solidly behind Finland; great contributions of money commenced to flood into Helsinki, and men, planes, and munitions of many nations commenced to funnel in through Sweden.

It was obvious, at the year end, not only that the Russian-Finnish struggle would be a hard one, but that Finland's fate seemed inextricably linked with Europe's. Not only was the "little war" in the north another manifestation of the same fatal sickness that caused the "big war," but both politically and strategically, there was more and more disposition to view the Finnish wilderness of snow and ice as a "flank" of the Western Front.

CASUALTIES AND LOSSES—RUSSO-FINNISH WAR

[Nov. 30—Dec. 31, 1939]

Men

Russia—30,000 to 60,000 killed, wounded, missing and prisoners. (Russian announcement of December 23 put losses at 1823 killed, 7000 wounded; Finns estimated 30,000 Russians had been killed.)

Finland—5000 to 15,000 killed, wounded, etc. (Finnish announcement stated 2000 had been killed; Russian communiqué said 2200 dead Finns had been found on the battlefields up to December 23.)

Planes

Russia—30 to 100; Finland—5 to 20

Ships

Lost: 1 Russian destroyer?

Damaged: 1 Russian destroyer?; Cruiser *Kirov*, 7000 to 7800 tons.

SUMMARY

The first four months of what was rapidly developing at the end of 1939 into a Second World War leave as their military monuments: first, a shattered trail of wreckage and rubble across Poland; and second, a contorted trail of Russian bodies, frozen into waxlike stiffness, across Finland. The "Campaign of the Eighteen Days," that German "Blitzkrieg" remarkable in military annals for its ruthless efficiency and relentless power, immediately changed the course of the war by limiting it—for a time—to one land front. The Russian invasion of Finland, remarkable for the series of defeats so quickly administered to the Red Army, restored a second front to the strategic scene, broadened the theater of war, and started a train of events whose end no man could know.

Note: All tables included in this article are estimates only, except where otherwise specified. It should be remembered that most of the data contained in this article have been strained through the sieve of censorship, although every effort has been made to check and re-check all facts and to avoid coloration or distortion. Polish sources were able, for obvious reasons, to provide little adequate data about the Polish campaign; most of that here presented comes from German sources or from neutral correspond-

ents. On the other hand a considerable portion of the material used in the section on sea warfare stems from British sources.

EXPLORATION. For the account of exploration of the polar regions in 1939, see POLAR RESEARCH. Anthropological and archaeological explorations are treated in the articles on ETHNOLOGY and ARCHAEOLOGY. See also GEOGRAPHICAL SOCIETY, AMERICAN; GEOGRAPHIC SOCIETY, NATIONAL.

Asia. Exploration on the Asiatic mainland in the course of 1939 was directed chiefly into the great central mountain area. Several regions in this area, all of them relatively accessible from the British territories to the south, received attention. In the Himalayas, according to the *Voelkischer Beobachter*, three mountain-climbers from Munich, Grob, Paidar, and Schmaderer, accomplished the first ascent of Tent Peak (alt., 24,026 ft.). Less fortunate, Karpinski and Zikiewicz, of a Polish expedition seeking in July to ascend Nanda Devi, a Himalayan peak (25,650 ft.) north of Lucknow, were destroyed by an avalanche at the height of 20,500 feet. An American sportsman, Dudley Wolfe, was reported in August likewise to have lost his life on an expedition of the American Alpine Club, led by Fritz Weissner, attempting the ascent of the so-called K-2, in the western Himalayas, reputedly the second highest of the world's mountains. In the Karakoram range, separating the Vale of Kashmir from Turkestan, Eric Shipton, another mountaineer, with a surveying party, was engaged during the summer and autumn in gathering data for a map of the region on behalf of the Survey of India. While the Himalayan mountain-climbing expeditions in general partook of the nature of sport, they nevertheless also constituted true exploration in that they sought to bring under human observation new territory and new environmental conditions. The activity that had marked, in 1938, the long-persisting effort to scale Mount Everest was not renewed in 1939.

Hasseldt Davis, leading an American expedition on the hunt for scenes of wild life, to serve as subjects for cinematograph films, obtained in Burma pictures of the little-known "leg-rowers," a tribe skilled in a method of working with the foot the paddles propelling long dugouts used on the Salween River. He also found and filmed a secluded Burmese tribe of snake-worshippers, apparently unknown to whites. In Iraq and Trans-

Jordan, Sir Aurel Stein finished his travels along the course of the ancient imperial Roman frontier. Returning to London he represented his work as completing that done earlier by Father Poydebard in Syria. He reported that he had found the remnants of a line of forts along the sides of the Jebel Sinjar and, between Nisibin and Mosul, old defenses that had commanded the route of ingress from Mesopotamia into northern Syria. A fairly well preserved castle of Roman construction, situated on the middle course of the Euphrates River, offered probable indication that the Roman Empire, about the time of Septimius Severus, had sought to protect the commercial route as far east as central Mesopotamia. On his trip back, Stein retraced the Via Nova of Trajan, from Akaba on the Red Sea to Syria. While largely archaeological, the finds of this expedition had the geographic merit of revealing the possibilities of travel by land in the Near East as developed by an earlier civilization.

Australia. The crossing of the Simpson Desert was accomplished under Dr. Cecil Madigan. This forbidding arid region of some hundreds of square miles had undergone little systematic exploration ever since the disappearance of Leichhardt in its depths in 1848. It extends about the junction of Queensland, South Australia, and the Northern Territory; Madigan had flown over it in 1928. The trip by travel over the surface was said to require the traversing of a waterless stretch of 250 miles. Equipped with the most ancient aid, and the most modern, for desert travel—the camel and the portable radio set—Madigan and his party set out, May 28, from Abminga, heading generally eastward. Their arrival at Birdsville, on the eastern rim of the desert, was reported about a month later. The surface of the route that they had traveled was largely sand, drifted into frequent ridges. In mid-desert, lacking water, the camels refused to eat dry food and seemed likely to succumb from thirst and starvation. Unexpected rain fell at this stage of affairs and renewed the supply of water. Madigan on his return gave no hope that the area could be made useful to human economy; he found little reason from his observations, on the other hand, to apprehend that the arid area would increase.

New Guinea. The exploration of the interior of Dutch New Guinea by Richard Archbold, associated with the American Museum of Natural History, was suspended indefinitely in December, because of the difficulties caused by warfare in Europe and Asia. A base that Archbold had created at Hollandia was given to the government of the Netherlands Indies for use as a laboratory of scientific research. The expedition's flying boat *Guba*, having covered 40,000 miles by air in 700 flying hours, made New York July 1. Leaving New Guinea, she had worked on a marine survey for the Australian government and had thereafter crossed Africa and passed from Dakar over the Atlantic to the Virgin Islands. A summary of the work of the expedition in Dutch New Guinea noted that it had collected 6000 species of plants, about one-fifth of them new to the United States; 15 new species of mammals; and 350 species of birds, of which 20 were new. Archbold ascended Mount Wilhelmina and there found a new bird, somewhat larger than a sparrow, bearing a red patch at the throat and having a beak of the flycatcher type.

The expedition into the area of Mount Hagen and the Sepik River, in the Australian mandate

of New Guinea, conducted by J. L. Taylor, concluded its work at the end of June, after a stay of 18 months in the interior. Taylor was quoted as expressing the striking judgment that the interior highland was potentially a "second Kenya," suitable for European settlers and for satisfactory civilized life; this view he qualified by pointing out that it would take time to make the country safe and accessible. The natives of the highland were described as of superior type, possessing a distinctive culture. The Victor Emmanuel range of mountains was crossed by one division of the party at the approximate altitude of 11,000 feet. A pass was discovered, through which the Sepik River traversed the range. About 20,600 square miles of territory in the interior were surveyed, much of it of desirable character, and thousands of inhabitants were found.

North and South America. While North America, except for its Arctic parts, no longer held unknown areas of sufficient interest to invite much exploration of other than the specialized sort, the work of surveying mountainous areas in the northwestern part of the continent was still incomplete. Led by Walter A. Wood, Jr., a party sent by the American Geographical Society continued in 1939 the task of surveying the Mount St. Elias range in the southwestern part of the Yukon Territory. About 1000 aerial photographs of the area of some 2000 square miles were made, and points of reference for future triangulations were established on the surface. The work supplemented that done by Wood in 1935 and 1936.

In South America exploring activity in parts of the highland south of the Caribbean, noteworthy in 1938, made further progress. Dr. Paul A. Zahl completed early in 1939 the expedition, begun in the autumn of 1938, to the isolated area near Mount Roraima, on the confines of southern British Guiana and of Venezuela. Reaching this area by seaplane from the coast, he and a companion traveled for six weeks on foot, spending a week of the time at an Indian village that the natives declared never before to have been visited by white men. The relations of the inhabitants, according to his observation, were exceptionally harmonious and contented. This village was near one of the two high waterfalls previously noted (YEAR BOOK, 1938) as discovered by Dr. Zahl.

Another party, the Cabot Colombian expedition, scaled in March a 19,000-foot peak of the Sierra Nevada de Santa Marta. Earlier parties had explored the northern, or seaward slope of the range, approachable only through a narrow but malarial zone of coastland 25 miles wide. The Cabot expedition, led by Walter A. Wood of the American Geographical Society, started from the seaport of Santa Marta and made a circuit of 250 miles to enter the mountain area from the west, through an intervening stretch of semi-arid paramo. A camp was established at 16,500 feet, where temperature averaged 35 degrees F., and went as low as 15 below zero. Three of the party, Wood, Bakewell, and the Swiss Alpinist Praolini, thence ascended what was judged to be the highest mountain of the range, an unnamed elevation called by the party the East Peak. A German expedition was found to have scaled a neighboring mountain, of approximately the same height, a month earlier.

The Cabot expedition made a brief aerial survey of the range. It brought back 175 photographs of the mountains, chiefly obtained by the oblique method in three hours of flight; these were in-

tended to serve, in combination, for a photogrammetric representation of the range as a whole. The spatial relations of the pictures to points of reference on the ground were obtained by use of theodolite and communication by radio. Animal life in the range's southern area above the 10,000-foot level was reportedly studied for the first time. Collections were made but had yet to be sorted and arranged. The Santa Marta mountains were found to cover an area about equal to that of the State of Connecticut.

In the Brazilian interior Alfred Vialini was engaged in the exploration of the mountainous area near the Serra do Roncador. From Vialini came the report that he had seen the skeletons of Col. P. H. Fawcett, Fawcett's son, and Raleigh Rimmell, who had disappeared in 1925 in the wilderness between the Kuluene River and the Rio Mortes. Another report, from General Rondon, on his return from a trip in the interior, confirmed, on the strength of word from a chief of the Bacairi Indians, Dyott's information of 1928, that the Fawcett party had been killed by Indians of the Anauqua tribe.

EXPORT-IMPORT BANK (EIB). Export-Import Bank of Washington was created pursuant to an Executive order of Feb. 2, 1934, issued under the authority of the National Industrial Recovery Act. It was incorporated as a District of Columbia banking corporation. The \$1,000,000 par value of common stock is held for the use and benefit of the United States. All common shares, except 11 shares standing in the respective names of the trustees, are held jointly by the Secretaries of State and Commerce in their official capacities.

The entire preferred stock of a par value of \$45,000,000 was subscribed for and purchased by the Reconstruction Finance Corporation.

Public Act No. 1, 74th Congress, as amended by Public Act No. 2, 75th Congress, and Public Act No. 3, 76th Congress, continues the Bank as an agency of the United States until June 30, 1941, or such earlier date as may be fixed by Executive order. Public Act No. 3, 76th Congress, places at \$100,000,000 the amount of loans or other obligations to it which the Bank may have outstanding at any one time and provides that funds shall be furnished through loans from or purchases of stock by the Reconstruction Finance Corporation.

The purpose of the Bank is to aid in financing and to facilitate exports and imports and the exchange of commodities between the United States and any of its territories or insular possessions and any foreign country or its agencies or nationals.

The activities of the Bank increased during the calendar year 1939 but, as theretofore, were principally in two major fields, namely, the financing of the exportation of agricultural commodities and of industrial products.

In addition, however, the Bank agreed to participate with American manufacturers and engineering firms in financing the sale and exportation to certain Latin American countries of equipment, supplies, and services essential to the development of approved projects designed to improve the economy of the respective country and increase its trade with the United States. Credits were extended also to a number of leading South American banks to provide dollar exchange during the interim between export seasons.

Commitments authorized during 1939 totaled

\$74,831,827, of which amount \$46,102,287 concerned trade with Latin American countries. The Bank disbursed \$53,737,746 and received repayments of \$14,695,699. Loans outstanding as of Dec. 31, 1939, totaled \$65,243,237. During the calendar year ended Dec. 31, 1939, net earnings were \$2,344,776.

FAIRBANKS, DOUGLAS. An American actor, died in Santa Monica, Calif., Dec. 12, 1939. Born in Denver, Colo., May 23, 1883, the son of H. Charles Ulman, he was educated at the Colorado School of Mines, and, for a short time, at Harvard University. His stage debut was made in *The Duke's Jester*, Sept. 10, 1900. Soon thereafter he legally changed his name to Fairbanks. In 1901 he made his New York debut in *Her Lord and Master*, and after a trip abroad and a short business career, he appeared in *Frenzied Finance* (1905). His subsequent stage appearances were in *All for a Girl* (1908); *A Gentleman from Mississippi* (1908), in which he toured the country for two years, and *Gentlemen of Leisure* (1911). By this time he was one of the leading juveniles of the American theater. Under the management of Cohan & Harris he had leading roles in *Hawthorne of the U.S.A.* (1912), *Henrietta* (1913), *Comes Up Smiling* (1914), and *Show Shop* (1914).

He then quit the stage for Hollywood and made *The Lamb* for D. W. Griffiths. He appeared in *Double Trouble*, *The Americana*, etc., and in 1917 formed the Douglas Fairbanks Pictures Corporation and produced a number of films. In 1919, with D. W. Griffiths, Charles Chaplin, Mary Pickford, and Charles Ray, he formed the United Artists Co. Each actor was to produce his own picture but to release it through the company as a distributing unit. Then began the period of his greatest popularity. He produced romantic fantasies, in which he, as the hero, rode horses, scaled walls, leaped from windows, and made sensational escapes. These films, in which he introduced technical developments and improvements, elaborate sets, and color, included *The Mark of Zorro* (1920), *The Three Musketeers* (1921), *Robin Hood* (1922), *The Thief of Bagdad*, *Don Q*, *The Black Pirate*, and *The Gaucho*.

With the advent of the "talkies," his star waned. In 1929 he made *The Taming of the Shrew*, co-starring with Mary Pickford. Thereafter he devoted himself mostly to travel, but reappeared in *Reaching for the Moon* (1931), *Mr. Robinson Crusoe* (1932), and his last picture, *The Private Life of Don Juan* (1934). Shortly before his death he announced that he would return to motion pictures as a producer, his first film being an adventure picture to end all adventure pictures.

One of the most spectacular of screen stars, Fairbanks was known throughout the world for his powerful physique and flashing smile. He was married three times; first, to Beth Sully in 1907, by whom he had one child, Douglas Fairbanks, Jr., and from whom he was divorced in 1919; second to Mary Pickford in 1920, from whom he was divorced in 1935; and third, to Lady Sylvia Ashley in 1936.

FAIR LABOR STANDARDS ACT. See CHILDREN'S BUREAU; LABOR CONDITIONS; WAGE AND HOUR DIVISION.

FAIRS AND EXPOSITIONS. In the field of expositions, the United States attracted the greatest interest in 1939 with two major events occurring simultaneously on opposite sides of the continent, in New York and San Francisco. A separate article in this volume is devoted to each of these two expositions. (See GOLDEN GATE INTERNATIONAL EXPOSITION and NEW YORK WORLD'S FAIR.) In co-operation with the Golden Gate Exposition, 19 northern California counties opened on May 1 the Sacramento-Golden Empire Centennial, celebrating the hundredth anniversary of the founding of California's capital city by Capt. John A. Sutter, Swiss pioneer. The historic Sutter's Fort, fully restored, and a reconstructed mining town of the days of Forty-Nine were opened to the public. Another celebration of historical nature in the United States was the Pan-American Hernando de Soto Exposition, which opened in Tampa, Florida, in February.

The founding of the United States of Brazil was celebrated in November, with President Vargas addressing a vast throng in Rio de Janeiro at the exact hour on which Emperor Pedro II had been deposed fifty years before. The United States sent six army "flying fortresses" on a good-will flight to Brazil, bearing a message of felicitation from President Roosevelt. One plane was disabled, but the other five arrived at Rio de Janeiro as scheduled on November 15, having completed en route the first non-stop flight between Lima and Asunción.

A leading event in Europe was the Swiss National Exposition held in Zurich, May 6 to October 29. The exposition, which occurs only once in every 25 years, was designed to show the evolution of Switzerland and included displays of every phase of national activity, both industrial and cultural. Zurich, the crossroads of the various cantons, offered a setting of great natural beauty along two sides of a lake. Folk plays and dances, opera, and various fetes featured the entertainment. A system of canals, winding through the exhibition halls and enabling visitors to see the exhibits from boats, proved to be a profitable innovation. Attendance at the exposition was approximately 10,000,000 although only 4,000,000 visitors had been anticipated originally. See ARCHITECTURE.

The first exposition in history to be devoted exclusively to water was the International Water and Waterways Fair, opened at Liège, Belgium, on May 21 by the five-year-old Prince Albert in his first official ceremony. Coinciding with the inauguration of the great Albert Canal, the exposition treated as its theme the relation of water to many phases of human activity. The grounds covered 250 acres on both sides of the Meuse River and contained an extensive Lido used for aquatic sports and competitions, a two-mile aerial cable railway, and an elaborate festival palace. Although the Fair was curtailed to only ninety days because of the European War, it closed without a deficit.

In addition to the usual annual events in Europe, attention was attracted to an International Exposition of Good-Will, or "Work and Joy" Exposition, which opened in Rumania in June. In the Far East, China celebrated its fifth anniversary of the "New Life Movement" with a two-week exposition at Chungking in February.

The first American-style cafeteria in China was opened for the exposition which, in many respects, resembled an American county fair. New Zealand celebrated its first century of existence with a Centennial Fair which was opened at Wellington on Nov. 8, 1939.

Prominent on the calendar for 1940 are the reopening of the New York World's Fair (q.v.), and an International Exposition for Polar Exploration scheduled for May at Bergen, Norway, in which all countries prominent in polar exploration have been invited to participate. Large-scale plans for the 1942 world's fair in Rome were well under way in 1939. Designated the "Universal Exposition of Rome," it will have as its theme "The Olympics of Civilization" and as its dominating structure a gigantic Roman arch symbolizing human will. The buildings are designed to be a permanent contribution to the enlargement and improvement of Rome and will accommodate 40,000 residents after the Fair is over. A four-mile super-highway, 109 yards wide, is to connect the exposition grounds with Rome. In September, Premier Mussolini gave instructions for the work to proceed as planned despite the international situation. See ARCHITECTURE.

FALKLAND ISLANDS. A British crown colony in the South Atlantic, comprising East Falkland, West Falkland, and adjacent islands. Total area, 4618 square miles; population (Jan. 1, 1938), 2391. Stanley (capital), had 1200 inhabitants in 1936. Sheep farming is the main occupation of the people. In 1937 imports were valued at £116,752 (provisions, £23,039; hardware, £21,133; timber, £6452); exports, £204,020 (wool, £162,511; hides and skins, £17,923; livestock, £13,773; seal oil, £4200; tallow, £2618). Finance (1938): revenue, £91,720; expenditure, £80,945. The government is headed by a governor, advised by an executive council of 5 official and 2 unofficial members. There is a legislative council of 4 official and 4 nominated unofficial members. Governor and Commander-in-Chief, Sir Herbert H. Heaton (appointed Jan. 3, 1935).

Dependencies. The dependencies of the Falkland Islands include South Georgia (1450 sq. mi., statute; population, approximately 700 in the summer and 233 in the winter), South Shetlands, South Orkneys, South Sandwich Islands, and Graham Land. Whaling (October 16 to April 16) and sealing (March 1 to October 31) are the chief occupations. During the 1936-37 season, 1759 whales were caught. The production of whale oil in 1937-38 amounted to 166,606 barrels. In 1937, total imports (including importations for re-exportation) amounted to £371,223; total exports (including re-exports of £182,764), £406,640 (whale oil, £305,049; guano, £34,328; seal oil, £32,496; whale meat meal, £26,044). Finance (1938): revenue totaled £15,545; expenditure, £13,829.

The dependencies are subject to the authority of the governor and to the executive and legislative councils of the Falklands.

History. Stanley, Falkland Islands, since the outbreak of war in Europe in September of 1939, has become the headquarters of British naval operations in the South Atlantic and the South Pacific. Several German merchant ships which left South American ports since the start of the war were said to have been captured by the British and taken to the Falkland Islands.

FAMILY INCOME AND EXPENDITURES. See LIVING COSTS AND STANDARDS.

FAR EASTERN TERRITORY. See RUSSIAN SOVIET FEDERATED SOCIALIST REPUBLIC.

FARM CREDIT ADMINISTRATION (FCA). Operating through 12 district offices, the Farm Credit Administration provides a complete and co-ordinated credit service for farmers and their co-operative business associations. Each district office is composed of four units—a Federal land bank, a Federal intermediate credit bank, a production credit corporation, and a bank for co-operatives.

The 12 Federal land banks, operating since 1917 under the Federal Farm Loan Act and subsequent legislation, make amortized long-term first mortgage loans to farmers through 3700 local national farm loan associations. Loans outstanding on Jan. 1, 1940, aggregated \$1,900,000,000 plus \$700,000,000 of Land Bank Commissioner loans made by the land banks as agents. Commissioner loans, first authorized in 1933 for emergency financing, are made on both first and second mortgage security.

The total capital of the Federal land banks was \$236,521,270 on Sept. 30, 1939. Slightly less than one-half of this amount was owned by national farm loan associations and individual farmers borrowing directly from the banks. The remainder was provided and is owned by the United States Government.

The 532 production credit associations, organized, capitalized, and supervised by the 12 production credit corporations, in accordance with the Farm Credit Act of 1933, made farm production loans totaling \$323,700,000 in 1939 compared with \$302,600,000 for the previous year. Typical purposes for which these loans were used include the purchase of seed, feed, fertilizer, spray materials, farm machinery, work stock, cattle, sheep, household equipment, and the hiring of labor.

Capital stock owned by farmer members of production credit associations increased from \$14,211,535 to \$15,312,915 from Sept. 30, 1938, to Sept. 30, 1939. On the latter date 17.6 per cent of the total par value of stock outstanding was owned by farmer members and the remainder was owned by the production credit corporations.

The 12 banks for co-operatives and a Central Bank for Co-operatives, established under the Farm Credit Act of 1933, make facility, operating capital, and commodity loans to farmers' co-operatives. Loans made in 1939 aggregated \$82,900,000.

The 12 Federal intermediate credit banks, organized in 1923 by the Agricultural Credits Act of 1923, operate as banks of discount. They are authorized to make loans to, and discount paper for, production credit associations, banks for co-operatives, state and national banks, livestock loan companies, and similar financing institutions. Loans and discounts made during 1939 aggregated \$474,600,000. The capital and surplus of the 12 banks (\$100,000,000) is owned by the United States Government.

Loan funds of the permanent institutions operating under the supervision of the Farm Credit Administration are obtained primarily from the sale of tax-exempt bonds and debentures to the investing public. These are not guaranteed by the United States Government. Farm loan bonds of the Federal land banks outstanding on Sept. 30, 1939, totaled \$1,776,696,040; Federal intermediate credit bank debentures aggregated \$205,300,000. Land Bank Commissioner loans are financed from the sale of Government-guaranteed

bonds of the Federal Farm Mortgage Corporation.

The emergency crop and feed loan offices, also operating under the supervision of the Farm Credit Administration, loaned farmers \$15,191,000 in 1939. These loans are made from appropriated funds. The Farm Credit Administration is also responsible for the supervision of the Federal credit union system.

Besides its activities which are primarily concerned with financing farmers and farmers' business co-operatives, the Farm Credit Administration carries on research. The Co-operative Research and Service Division of the Washington, D. C., office conducts research studies relating to problems of farmers' co-operative marketing, purchasing, and service associations. The results of these studies are published in bulletin form. Another division—Economic and Credit Research—works on projects relating to credit.

Headquarters of the 12 districts are located in Springfield, Massachusetts; Baltimore, Maryland; Columbia, South Carolina; Louisville, Kentucky; New Orleans, Louisiana; St. Louis, Missouri; St. Paul, Minnesota; Omaha, Nebraska; Wichita, Kansas; Houston, Texas; Berkeley, California; and Spokane, Washington. See AGRICULTURE; AGRICULTURE, U.S. DEPARTMENT OF.

E. B. REID.

FARM MACHINERY AND EQUIPMENT. Although demand was retarded by the decline of farm product prices in 1938 and 1939, progress in the mechanization of agriculture was continued despite the shrinkage in the farmer's cash income. Investigators, inventors, and manufacturers carried their work forward with the general objective of providing the farmer with tools, implements, and machines of greater efficiency, better suited to his needs and meeting more of his requirements. As in preceding years the U.S. Department of Agriculture and the agricultural experiment stations played an important part in these activities.

During the year attention continued to be centered, among other problems, on artificial hay drying, the use of the Diesel engine in farm machinery and for other farm power purposes, the displacement of steel tires on farm wagons and machines, especially tractors, the wider use of electricity on the farm and in the farm home, the refrigeration requirements on the farm especially where dairying is the leading activity, machines and implements called for by the great national movement in soil conservation, mechanical equipment suitable for the small farm, and combination equipment of increased capacity and performing effectively multiple operations at one and the same time for farms of larger acreages.

Machines, implements, and devices which have recently come into use or are passing through the final stages of trial include hay driers, a sugar-cane cutter, a machine for picking up stones and potatoes, a bean cultivator and harvester, a large-scale nut cracker, a hop picker, a push-type harvester for peas and other canning crops, automatic and other plow hitches, and other similar forms of farm equipment.

The artificial hay drying systems under development provide for the drying of hay as it comes from the field or after it is placed in the mow. The mechanical sugar-cane cutter, appearing for the first time in 1939 in larger numbers in the Louisiana cane fields, cuts and loads an

acre of cane in an hour which represents ten or more man-days of work when done by hand. The bean cultivator and harvester can be used for preparing the soil and cultivating and harvesting the crop. An attachment to a corn planter for planting twin rows of soy beans six inches apart has also come on the market recently.

At the request of the California Walnut Growers Association the California Agricultural Experiment Station is developing an improved method of cracking nuts on a commercial scale. This method involves the mechanical puncturing or cutting of the shells to admit a gas mixture which when exploded shatters the shell and separates it from the kernel. At the present stage of development about 900 lb. of walnuts can be cracked per hour. The hop-picking machine is said to enable seven hands to do the work of fifty or more hand-pickers.

An automatic plow-hitch for tractors is reported to make it possible for the plow to strike stones with light impact and, under favorable conditions, to slide over the obstruction and, when its point goes under a heavy stone, to bring the tractor to a halt. A simpler plow-hitch recently devised counteracts the down-hill pull when plowing contour terraces now quite generally constructed to prevent soil erosion.

The farm tractor continues to receive attention to adapt it better for meeting all farm requirements. Tractors now are used for nearly all kinds of farm work and recently special tractors for use in orchards and in rice fields have become available. Pneumatic tires are made so they can be placed readily on the steel tractor wheels after removing the customary lugs. An estimate by the Farm Implement News places the number of tractors on farms in the United States as of Apr. 1, 1939, at 1,625,820 with 1,332,422 of this number in the 17 leading states, among which Illinois stands first with 146,971, Iowa second with 133,410, and Texas third with 107,696.

The Colorado Agricultural Experiment Station in co-operation with U.S. Department of Agriculture is working on the development of a single-seed sugar-beet planter with the objectives of eliminating or at least reducing the thinning of the beets to a proper stand and of obtaining a more uniform spacing of the plants. It is thought that single-seed plates may be devised for insertion in the type of planters now in use to obtain the desired results.

For many years the United States has been a leader in the export of farm machinery and implements, but during the last decade Germany became increasingly important in this field. According to figures published by the U.S. Department of Commerce the ratio of such exports by the United States and Germany was 7 to 1 in 1929, 5 to 1 in 1937, and 4 to 1 in 1938. This increasing rate of German export was arrested by the outbreak of war during September of 1939.

J. I. SCHULTE.

FARMS AND FARMING. See AGRICULTURE and the topics there referred to.

FARM SECURITY ADMINISTRATION (FSA). The Farm Security Administration was created by the Secretary of Agriculture on Sept. 1, 1937, as successor to the Resettlement Administration. Its purpose is to help farm families on, or near, relief to become permanently self-supporting. Since 1935, when this type of assistance was first given under the authority of

the Resettlement Administration, financial aid has been extended to more than 1,231,000 farm families. The work is divided into three phases.

Rehabilitation Program. Farmers unable to obtain adequate credit from any other source may receive small loans from the Farm Security Administration which will enable them to continue farming. These loans, based on sound farm and home plans, averaged \$397 each during the past fiscal year. They usually are just large enough to enable the farmer to buy seed, tools, livestock, fertilizer, and the other equipment he needs to make a living. The loans draw 5 per cent interest. At the close of the year, the number of active rehabilitation loan cases totaled 589,046.

A survey made at the end of the 1938 crop year showed that standard rehabilitation borrowers had increased their net worth—over and above all debts—by an average of \$269, or 37.4 per cent, since coming on the program. Between 1935 and the end of the 1939 fiscal year, 101,133 debt-burdened farmers had been able to work out amicable adjustments with their creditors through the help of voluntary committees of local citizens appointed by the Farm Security Administration. Debts were scaled down about 25 per cent.

Community service loans often are made to groups of farmers in the same neighborhood to enable them to buy equipment or services no one of them could afford alone. During the past fiscal year 4333 such services, of 72 different types, were established. These involved approximately \$3,054,000 and are serving 107,059 families.

As of June 30, 1939, county or district plans for group medical care for nearly 100,000 needy farm families were in operation in 23 states. Agreements had been reached with State medical associations in six other states for the establishment of similar county medical care programs.

In areas stricken by drought, flood, or hurricane, the Farm Security Administration makes subsistence grants to destitute farm families. These average about \$20 per month per family. During the past year the total cash grant disbursement to individual families amounted to about \$22,758,444.

Tenant Purchase Program. The tenant purchase program, authorized by the Bankhead-Jones Farm Tenant Act in 1937, enables a limited number of farm tenants and laborers to obtain loans to buy farms of their own. Congress appropriated \$25,000,000 for this purpose for the 1939 fiscal year, and 4340 loans were approved in 732 counties. These loans included money for building 1610 new dwellings, costing an average of \$1313. In addition, repairs were made on 2556 tenant-purchase farm dwellings; and barns and outbuildings were constructed on 4146 farms. Repayment of tenant-purchase loans extends over a period of 40 years at 3 per cent interest. An appropriation of \$40,000,000 was made for this program during the fiscal year. It was expected to provide for almost 7000 loans.

Homestead Projects. The Farm Security Administration administers 161 homestead projects which were turned over to it by the Resettlement Administration and other predecessor agencies. They are scattered throughout the country and vary in type; some having small individual farms, others having co-operative enterprises, and a few having industrial plants to supplement farm income. These projects provide homes for almost 14,000 families.

The FSA has established 26 permanent and 6

mobile camps to provide sanitary living conditions for a small part of the army of migratory agricultural workers. At the end of the fiscal year, the Administration had in operation 1432 tent platforms, 749 shelters, and 166 labor homes. It had under construction 1388 tent platforms, 3414 shelters, and 660 labor homes. When the present program is completed, the camp facilities will serve 7809 families at one time.

W. W. ALEXANDER.

FAROE (FAEROE), fär'ö or fä'rö, **ISLANDS.** A group of 21 islands (the chief being Bordö, Kalsö, Österö, Sandö, Strömö, Suderö, Vaagö, and Viderö) north of Scotland, forming a county of Denmark. Total area, 540 square miles; population (1935), 25,744. Capital, Thorshavn (on Strömö), 3200 inhabitants. The chief exports consist of fish, whale oil, woollen goods, lambskins, and feathers. A prefect, named by the King of Denmark, heads the administration. The local parliament (Lagting) of 25 members elects a member to the Danish Landsting (upper house), and the people elect, by vote, a member to the Danish Folketing (lower house).

FARRAND, LIVINGSTON. An American educator, died in New York, Nov. 8, 1939. Born in Newark, N. J., June 14, 1867, he was educated at Princeton University (A.B., 1888) and at the College of Physicians and Surgeons (M.D., 1891). Until 1893 he studied abroad at Cambridge University and the University of Berlin, and upon his return joined the staff of Columbia University as an instructor in psychology. Successively he was adjunct professor of psychology (1901-03) and professor of anthropology (1903-14). During this latter period he went on two expeditions of the American Museum of Natural History to study the Indians of the American Northwest, and his writings at that period dealt principally with the anthropology of the American Indian.

His medical training led to his interest in tuberculosis and methods of fighting the dread disease. In 1905 he became the executive secretary for the National Association for the Study and Prevention of Tuberculosis, and in 1912 he was elected treasurer of the American Public Health Association, and editor of its *Journal*. His election as president of the University of Colorado on Jan. 1, 1914 led to his giving up these offices. While in the West he greatly elevated the standards of the University and reorganized its Medical School. In 1917, he obtained a leave of absence to go to France as director of tuberculosis work in that country under the auspices of the International Health Board of the Rockefeller Foundation. For his work in this field he was made an Officer of the French Legion of Honor. His familiarity with the work of the American Red Cross led to his appointment by President Wilson as chairman of its Central Committee in 1919, and he resigned from the University to take over this work. Under his directorship the great work of transition from war to peace was made and relief work done among the civilian populations of Europe.

In 1921, Dr. Farrand was elected president of Cornell University. Under his regime the building program of the University was continued, and many changes made in the curricula. In 1937 upon reaching the age of 70 he was retired as president emeritus. Thereafter he was active in making a special survey of the Public Health Schools of New York in association with the Surgeon General of the United States.

Dr. Farrand served as a member of a committee making a survey of agricultural conditions in Puerto Rico in 1928, and headed the New York State Health Commission (1932), being a firm advocate of the adoption of health insurance. In 1932 he was elected chairman of the Board of Trustees of the Carnegie Foundation for the Advancement of Teachers and two years later went on expedition to Yucatan to study the Mayan ruins. His work in many fields brought him numerous honorary degrees. Outstanding among his writings was *Basis of American History* (1904).

FASCISM. The sensational advances registered by world fascism during 1938 (see 1938 YEAR BOOK, p. 243 f.) continued during the first half of 1939. But the announcement of the German-Soviet non-aggression pact on August 21 fell like a thunderbolt in the Fascist ranks, shattering the pro-Fascist anti-Comintern bloc built up by Chancellor Hitler during preceding years and introducing deep divisions among the Fascist states that remained unhealed at the year end.

Fascist Successes. The advancing surge of fascism culminated in March of 1939 in a series of world-shaking successes. On February 24 Hungary and Manchoukuo joined the ranks of the anti-Comintern bloc. On March 15 Hitler seized Bohemia and Moravia. In subsequent days he established a protectorate over Slovakia—which openly joined the Fascist states—and seized Memel from Lithuania. On March 19 the French Parliament granted Premier Daladier dictatorial powers to deal with the increasingly critical European situation. Then came the resounding Fascist triumph in Spain on March 28 when Madrid capitulated to General Franco and his Italian and German allies. On April 7 General Franco announced Spain's adherence to the anti-Comintern pact. The following day Mussolini invaded Albania, annexing it to Fascist Italy. On May 22 Mussolini and Hitler transformed their political entente into a seemingly hard-and-fast military alliance.

These sensational gains, won by Fascist methods and policies, gave further powerful impetus to the movement. Hitler's successive coups in March increased Nazi prestige throughout central and southeastern Europe and strengthened Fascist movements in Bulgaria, Hungary, Rumania, and many other countries. Repercussions were seen in the substantial gains registered by the Hungarian Nazis in the elections of May 28-29; in the further subordination of Catholic Action to the Fascist party in Italy in July; and in the unsuccessful Iron Guard conspiracy in Rumania in September. Under the influence of European fascism's rapid progress, Japan was drawn toward a military alliance with Germany and Italy.

Propaganda in Americas. The conversion of Spain into a Fascist state had particularly far-reaching effects in Latin America. Under the supervision of the Franco Government, Spanish Fascists in many New World republics were organized as units of the *Falange Española* to promote the restoration of a Spanish Empire comprising all the Spanish-speaking nations. In some of the American countries they formed alliances with native Fascist and anti-democratic groups, and with foreign elements engaged in promoting the interests of Germany, Italy, and Japan at the expense of the democratic powers. The Spanish Fascist movement obtained powerful support from some leaders of the Roman Catholic clergy in Latin America.

The United States and the Pan American move-

ment bore the brunt of the Fascist propaganda offensive in Latin America. But it was also directed at native radical, liberal, and democratic movements and at British and French economic and political interests. This propaganda war, waged by radio, press services, moving picture films, and through diplomatic and consular offices of the Fascist countries was replied to in kind by anti-Fascist groups in the Latin American countries and by the democratic powers. The struggle was waged in every country and in every inter-American conference during the year, increasing in intensity after the outbreak of the European War in September. Even after the Nazi-Soviet rapprochement in August, the Italian and Spanish-owned press in Latin America remained strongly pro-German.

Activities in United States. In the United States, Canada, South Africa, and other parts of the world the Fascist and Nazi successes in Europe likewise had the effect of spurring the enthusiasm and activity of like-minded groups. This was reflected in the increased attention attracted by Father Charles E. Coughlin's radio broadcasts, the anti-Semitic activities of the Christian Front and other pro-Fascist groups in the United States, the growing boldness of the German-American Bund, and the prominence achieved by Gen. George Van Horn Moseley, U.S.A. retired, as a prospective leader of a Fascist movement in the United States. Testimony taken by the Dies Committee served to inform the country regarding the policies and programs of the various Fascist groups and their leaders.

In a preliminary report on Nazi and Fascist groups in the United States published August 31, the Dies Committee declared that their "primary aims appear to be (1) a radical change in the American form of government and (2) the collection of dues from such misguided citizens as will support them." It reported that these organizations had "borrowed some or all of the ideology of European fascism," and that "these groups are engaged in a form of racketeering, as well as in subversive activity." Other excerpts from the report follow:

In these times, when democracy is harassed from many sides, peewee Hitlers, aspiring Fuehrers and would-be Caesars have arisen in our midst urging our people through an unprecedented volume of propagandistic literature to resort to force and violence against large sections of our population.

We call special attention to the deplorable prostitutions of such words as "patriotism" and "Christian" to the selfish ends of these fascist racketeers.

Like Hitler, these American Fascists make their chief appeal to the basest forms of race hatred.

Like Hitler, they promise to deliver this country from the menace of communism. Like Hitler, they heap scorn upon the institutions of democracy. Like Hitler, they urge the short cuts of force and violence.

The testimony which our committee has heard reveals a widespread co-operation between half a hundred of these Nazi-Fascist groups. Interchange of speakers and literature is common.

On several occasions in recent months they have endeavored to come together in some kind of a permanent federation. So far these efforts have been frustrated by organizational jealousies, but the search for a "man on horseback" goes on.

Taking cognizance of these developments, 2391 American educators and publicists on April 23 issued a manifesto calling attention to "the threat to democracy inherent in demands for retrenchment in education, in attacks on the Bill of Rights, in gag laws, in censorship of teachers and journalists, in racial and religious intolerance, in those newspapers which make profit or power their chief goal."

Anti-Fascist Reaction. The rapid advance of Fascist influences the world over provoked a counter-offensive from anti-Fascist forces. Among the developments adverse to fascism in Europe during the year were the replacement of the pro-Fascist Stoyadinovitch Government in Yugoslavia on February 4; the abandonment of Prime Minister Chamberlain's appeasement policy in March after the Nazi seizure of Bohemia and Moravia, and the formation of an Anglo-French "stop Hitler" bloc; the crushing defeat of both Fascist and Communist parties in the Belgian elections of April 2; the dissolution of another Nazi party in Bulgaria on April 11, and subsequent measures in Hungary and the Balkan countries to curb Nazi-Fascist propaganda.

The Nazi-Soviet non-aggression pact of August, German-Russian despoliation of Poland, and Germany's action in turning over the Baltic States to Bolshevik Russia aroused resentment and dismay in Spain, Italy, Japan, and in all of the other countries of the world with the exception of Bulgaria, Germany, and the Soviet Union. The anti-Comintern pact was, for the time being, annulled. Italy refused to join Germany in war with Britain and France. Japan decided not to conclude the projected alliance with Germany and Italy. Spain adopted a policy of neutrality in the European conflict. The propaganda in Latin America emanating from Germany, Italy, and Spain showed an increasing tendency to back-fire, while native democratic forces were strengthened and the carefully planned campaign inaugurated by the United States Government for closer economic, political, and cultural ties with the Latin American republics made substantial headway.

In the United States Federal, State, and local authorities late in 1939 returned indictments against a number of Fascist leaders and members charged with violations of the law. Fritz Kuhn, Fuehrer of the German-American Bund, was found guilty of grand larceny and forgery by a New York City jury on November 29 (see NEW YORK CITY). Three members of the Silver Shirt League of America were convicted of malicious mischief in Chicago on December 29 for throwing bricks through windows of a Jewish-owned department store. The Federal Bureau of Investigation began an inquiry into the Christian Front and other extremist groups. A series of decisions of the U.S. Supreme Court tended to curb the anti-union activities of Mayor Frank Hague of Jersey City and ordinances and activities of other municipalities and groups that were described as anti-democratic.

See each of the countries mentioned above and ARGENTINA, BOLIVIA, BRAZIL, CANADA, CHILE, CHINA, COLOMBIA, CUBA, DENMARK, ESTONIA, FINLAND, GREECE, LATVIA, LITHUANIA, MEXICO, NETHERLANDS, SWEDEN, and SWITZERLAND under *History*; COMMUNISM; DEMOCRACY; DIES COMMITTEE; PAN AMERICANISM.

FASHION EVENTS. Fashion is the impetus which gives life to one of America's major industries. The designing, manufacturing, merchandising, and advertising of women's apparel and its subsidiary businesses represent a larger volume of business than that of the automobile industry.

Some of the various enterprises which make up the fashion business may be divided into the following sections: Textiles and Trimmings; Ready-to-wear dresses, coats, suits, blouses; Lingerie; Corsets; Furs; Stockings; Shoes; Costume Jewelry; Handbags and Accessories; Cosmetics and Perfumes; Millinery.

The department store and specialty shop are the principal outlets for this merchandise, with drug stores, beauty shops, and chain stores selling approximately 48 per cent of cosmetics and perfumes. These retail outlets are organized into buying groups and maintain joint offices and resident buyers in New York which is the chief market and manufacturing centre for all women's wear. However, there is a new and increasing trend toward the establishment of apparel factories in the middle west and on the west coast.

Retail stores send their merchandise managers and buyers to the "Seventh Avenue Market" several times a year. This market takes its name from the street in New York on which it is chiefly located. There, manufacturers maintain show rooms for display and sale. A Fashion Forum, at which next season's fashions are shown, is conducted by Tobé, a woman who has achieved such important success as a fashion advisor that she is retained by more than one hundred stores throughout the United States. The personnel of these patron stores attend the forums and are further guided by Tobé's reports, mailed to them every week.

Fashion Press. Two other important selective forces are at work in this fashion world: *Vogue*, edited by Edna Woolman Chase and published in New York, London and Paris, and *Harper's Bazaar*, edited by Carmel Snow and published in New York and London. Their editorials endeavor to separate the wheat from the chaff and their advertising pages are the chief mediums of propaganda employed by manufacturers. Fashion information is also published in women's magazines of large circulation, *McCall's* being an important source for patterns for home sewing. *Women's Wear*, a daily newspaper published in New York and edited by Winifred Ovitte, is a leading trade publication.

Important to the promotion of fashion are the stories published on the Woman's Pages of newspapers. They are written in the fashion centres of New York and Paris and by local reporters who are becoming increasingly important.

Fashion Design. Paris continues, as it has been for generations, to be the creative fashion source. The collections of the designers, Schiaparelli, Alix, Molyneux, Lelong, Chanel, Lanvin, Vionet, Pacquin, Mainbocher, are shown four times a year as are those of the milliners, Suzy, Talbot, Agnès, and are attended by resident buyers, store representatives from America, and by the press.

In America, design still remains adaptive rather than creative. Since 1931 the recognition of American designers has been actively promoted by Dorothy Shaver. In 1937 an annual award consisting of four \$1000 prizes for distinguished design was instituted by Lord & Taylor, New York Department Store, of which Miss Shaver is 1st vice president. Awards are given on any type of merchandise for which there is a consumer demand. In April 1939 the winners for the previous year were announced. They were Raymond Lowey, refrigerator; Walter Dorwin Teague, cash register; Adrian, Women's Fashions; Merrie Hull, free action glove.

Fashion Advertising is presented via magazines, newspapers, display, and radio, but television has not yet become the power it may reach. Window and interior display is increasing in importance. The magazines, *Vogue*, *Fortune*, *Collier's*, alert to the consumer's interest, published stories about the "Sidewalk Show." During 1939

display reached new heights of drama, humor, imagination; leading artists took part in its production. Mannequins used to display apparel were made to conform to the new silhouette and sometimes actually wore current cosmetic colors. The impetus given fluorescent lighting by the New York World's Fair resulted in a revolutionary development in store lighting and displays which will be felt for many years to come. It is estimated by Alfred Bliss, a leading exponent of modern display methods, that now the national expenditure for store displays has mounted to two million dollars and employs about ten thousand people, largely men.

Fashion Organizations. The Fashion Group, a non-commercial organization of professional women, organized in New York now has eight regional groups located in principal cities throughout the United States and a total membership of 980. Louise Paine Benjamin, associate editor of the *Ladies Home Journal*, is the president. Luncheon meetings are held monthly at which various phases of fashion are discussed by prominent speakers. The purpose of the Fashion Group is to "advance the principles of applied art in industry and to foster good taste in fashion; to encourage the co-operation of those engaged in conceiving, designing, and executing fashions; and, through proper education and the dissemination of useful information, to inspire a keener interest in fashions, to the end that those engaged in the field of fashion may better serve themselves and the public at large."

Fashion Developments. Change is vital to the fashion business; it sets the wheels in motion. So we find that in the spring of 1939 Fashion was characterized by a little-girl air of innocence, with the symbols of Victorian childhood in favor. By autumn, Fashion adapted a mature elegance with strong Edwardian tendencies. In the spring the silhouette showed waists dwindling, hips expanding. The diaphragm was built up and the bust appeared high and rounded. In August, the laced corset, sponsored by Mainbocher, proved the sensation of the Paris openings, and the size of a woman's waist was aptly described by the word "wasp." Full skirts gave place to a pencil silhouette and the bustle to front drapery.

The Color Spectrum followed the trend to sophistication. The spring pastels resolved into shadowy, muted tones. As the popular favorite, a military red took first rank. Trimmings lent a new magnificence. Old-time passementerie became the vogue along with gilt braids, jewelled embroideries, and quantities of fur. Spring hats were diminutive with enveloping veils coyly framing the face, then as the coiffure moved downward hats grew larger and snoods covered all the hair. Jewelry assumed exceptional importance.

Early in the year cosmetics abandoned the purple tones of 1938 for rose shades, then for clear reds. Every smart woman had at least three lipsticks. Bathing requisites enjoyed an amazing popularity and outsold perfumes, with bright, fresh, wood-like scents, such as pink clover, enjoying the highest favor.

The shoe revolt occurred in the late spring. Women literally refused to wear the toe-less, heel-less shoes which manufacturers and stores promoted. Shoes became lighter, almost seamless, heels and soles were geometrically planned.

The reefer, with lapels, was in high favor largely due to the handsome appearance made by the actor, Lawrence Olivier, in his great coat

worn in the cinema, *Wuthering Heights*. In fact, this was but one feature of an increasing trend toward the adaption of male fashions by women. Hollywood's fashion influence continued strong. The exotic beauty of Hedy Lamarr lent turbans and pearls new emphasis. In February, *Glamour*, a magazine of Hollywood fashions published by Condé Nast appeared, and by October had achieved the largest newsstand circulation of any fashion magazine. In the theatre the Portuguese singer, Miranda, brought about the renaissance of many strands of beads and bib-size necklaces.

Always an important fashion influence, the American college girl, declared her preference for shorter skirts, longer sweaters, and her socks mounted from the ankle to the knee. The casual mode preferred for class went into brilliant reverse on formal occasions. Then even the simplest dress was lifted, by the imaginative use of accessories such as elaborate costume jewelry, flower headdresses, mantillas, to the importance of a toilette.

World events always have strong fashion influence and this year was no exception. Overnight the umbrella carried by Chamberlain to the Munich Conference became an essential accessory to every chic costume. The visit of the Queen of England to America brought a faint revival of the parasol and strongly initiated the ankle-length formal afternoon dress. The exhibit in Geneva of the paintings of Goya and Velasques gave inspiration for hairdresses copied from their portraits. The Spanish silhouette with bouffant skirts and tight bodices, but interpreted in rich glowing colors gained immediate favor and their designer, Balenciaga, quickly rose to a top place. The brilliance and the fertility of ideas shown by the August Collections in Paris were eloquent of French courage in the face of impending war. Though fashions did not precisely ape the military, its impress was upon them, as shown by the prevalence of braid and white accessories, the importance of black and muted colors, and the complete "black-out" or "cover-up" of the hair and the figure until only hands and face were visible.

For the first time Pan-American Clippers flew dresses and hats from the Paris collections to America, a few hours after their showing. Barely were these August collections over when mobilization began. Some of the leading designers and their staffs left for war or for New York. English women went into uniform.

Unquestionably 1939 ushered in a new fashion cycle of premier importance to America for the year closed with New York the only functioning world-capital. As a result, social life became more cosmopolitan. Cafés presented a brilliant company which was more aristocratic than ever before. The city's importance as a luxury market increased. The best art exhibits, the leading painters and designers, and that chief source of creative fashion—the chic cosmopolitan woman—all important factors which make for creative fashion effort, came to this new center America now assumed new importance and promise in the fashion world.

FBI. See FEDERAL BUREAU OF INVESTIGATION.

FCA. Farm Credit Administration (q.v.).

FCC. Federal Communications Commission (q.v.).

FEDERAL ALCOHOL ADMINISTRATION (FAA). Congress has vested in the

Federal Alcohol Administration the responsibility of regulating the business conduct of the alcoholic beverages industries, in the public interest. While the responsibility for controlling the liquor traffic rests primarily with the individual States, under the terms of the 21st Amendment to the Constitution, the Federal Government supplements the efforts of the States in the interstate field. All producers, importers, and wholesalers of alcoholic beverages, except brewers, are required to obtain basic permits from the Administration, conditioned upon compliance with all Federal laws relating to alcoholic beverages. By the end of 1939, Federal permits to the number of 15,416 were active.

In order to prevent the shipment in interstate commerce of misbranded products, standards of identity for which had already been set up by the Administration, all bottlers and importers of distilled spirits and wines, and to a limited extent bottlers of malt beverages, are required to obtain from the Administration certificates of label approval covering alcoholic beverages intended to be withdrawn from customs custody or bottled for interstate shipment. During the past year, 93,656 applications for label approval certificates and certificates of exemption from label approval were acted upon.

In the drafting of the advertising regulations and in their enforcement, the Administration has endeavored to meet the desire of Congress that current liquor advertising should be free from the objectionable features which characterized the advertising of the pre-prohibition period. The regulations are designed to require that all alcoholic beverages be sold as such, and that references to vitamin content, tonic properties, and medicinal virtues be omitted.

During the year, 67,182 newspaper and magazine advertisements have been checked, and 6,970 advertisements in the form of booklets, leaflets, posters, placards, statuettes, and novelties have been examined. The script for approximately 425 commercial radio broadcasts is reviewed each month.

The Federal Alcohol Administration, because of the inadequacy of existing laws, has been unable to prevent the bootlegging of taxpaid liquor across State lines. While Congress in 1936 passed a law "to enforce the 21st Amendment," this law operates to protect from bootleg shipments only the States of Oklahoma and Kansas. There is nothing at present in the law which prevents bootleggers residing in other States from going across State lines, purchasing liquor in large quantities from licensed distributors, and transporting it back into their own States for unlawful sale and use.

In order to conceal such transactions, in numerous instances the permittees falsified their records, and the Administration has succeeded in unearthing this practice and correcting it. During 1939, sixteen permits were suspended in cases which involved the movement of liquor across State lines for unlawful use, and one permit was revoked. In 23 other cases, permits were voluntarily surrendered either after investigation had begun or after proceedings had been instituted for violations of this nature.

The so-called Monopoly States have fared as badly as the Dry States from the bootlegging of taxpaid liquor, and the Administration has had many complaints from them and has succeeded in minimizing the evil, in one notable instance break-

ing up a large bootleg ring which was flooding the State of Ohio.

Violations of the fair trade provisions of the Act, particularly with respect to the furnishing of money, articles of value, and services to retailers, are prevalent. Of the 452 trade practice investigations conducted during 1939, 213 involved violations of this kind.

During the past year, the Administration has continued its activity, commenced July, 1937, looking to the voluntary removal of outside signs furnished to retail establishments by permittees, and has met with almost universal co-operation from the liquor industry in this program. To date, well over 10,000 such signs have been removed.

Five years' experience with the law has developed certain weaknesses which have been called to the attention of the Congress. If the authority asked for is granted, Federal control of the liquor traffic will be tighter and more efficient, a thing that the industry, as well as the public, much desires.

W. S. ALEXANDER.

FEDERAL BUREAU OF INVESTIGATION (FBI). The fiscal year 1939 witnessed a continued development of the co-operative and service features of the Federal Bureau of Investigation to American law enforcement. More demands have been made on the Bureau during this fiscal year than at any other period in the past 15 years.

The extensive and unparalleled judicial investigations presented investigative problems that were unique and possessed far-reaching ramifications. These investigations were of vital importance in order that the Federal judiciary might maintain the confidence of the nation which it has always enjoyed.

Even though the fiscal year showed a slight increase of crime over the preceding year, the condition of American law enforcement reached its highest level of proficiency in our national history. In the fiscal year 1939, the Federal Bureau of Investigation co-operated in the inauguration and operation of 183 police training schools in the United States, which for the greater part were under the supervision of graduates of the FBI National Police Academy.

The scientific aids to criminal investigations were further extended during the fiscal year with the application of technical knowledge to the practical application of crime detection. With the development and extension of police training, law enforcement officers in every section of the country have a keener appreciation of the scientific assistance which is available to them. The problems of the Technical Laboratory are different from those of any laboratory in the nation in that unusual items of physical evidence are constantly being received and each examination is different although the basic techniques may be similar. During the fiscal year over 5,559 examinations were conducted in the FBI Technical Laboratory, involving more than 39,000 specimens of evidence.

The Identification Division of the FBI completed its 15th fiscal year on June 30, 1939, by far exceeding the services rendered to American law enforcement in previous years. Created in 1924 with a nucleus of 810,188 fingerprint cards, its files at the close of the fiscal year included nearly 11,000,000 sets of fingerprints. In 1924 there were

987 contributing law enforcement agencies while in the fiscal year 1939 there were 10,528.

The investigative forces of the Federal Bureau of Investigation received many additional burdens during the past fiscal year. Work in espionage and related fields increased tremendously and during the past fiscal year it exceeded the volume of such cases handled during any previous year since the late World War. There were 37 convictions for violations of the Federal Kidnaping Law as a result of the work performed by the Bureau, with the imposition of sentences totaling 1 life, 254 years, 6 months, 1 day. During the past fiscal year numerous investigations were conducted under the Federal Bank Robbery Act. One hundred twenty-six convictions were secured resulting in the imposition of sentences totaling 5 life, 1933 years, 1 month, 5 days. The recovery of bank loot during the fiscal year totaled \$192,829. Fifty-one fugitive bank robbers were located during the year.

A great variety of special investigations were conducted including investigative inquiry in the State of Kansas into the question of oil rights of Indian Tribes and an extensive investigation of hot oil operations in the State of Texas, as well as numerous special antitrust investigations.

There were 5162 convictions secured during the fiscal year in cases handled by the FBI with impositions of sentences totaling 12 life, 16,948 years, 6 months, 5 days in actual, suspended and probationary sentences. In the past 15 years, a total of \$52,370,222 was appropriated for the operation of the FBI, while savings, fines and recoveries resulting from the investigative activities of the Federal Bureau of Investigation totaled \$251,855,353. Convictions were secured in 96 per cent of the cases investigated by the FBI during the fiscal year which were brought to trial.

One thousand eight hundred ninety Federal fugitives from justice were located by Special Agents and 7933 fugitives from justice were located by searching their fingerprints through the files of the Identification Division. See JUSTICE, U.S. DEPARTMENT OF.

J. EDGAR HOOVER.

FEDERAL CAPITAL TERRITORY.

See AUSTRALIAN CAPITAL TERRITORY.

FEDERAL COMMUNICATIONS COMMISSION. The fifth year of the Federal Communications Commission saw radio receiving increased attention as a result of neutrality problems invited by the European war and because of developments in television, facsimile, and the new frequency modulation system of broadcast.

During the year the Commission, as a result of public hearings, completely revised its rules and regulations governing all forms of radio service. A special committee recommended modification of regulations to encourage orderly development of television but with protection to the public from premature promotion. Another committee inquired into the policies and practices of "chain" broadcasting. And the study, instituted at the request of Congress, of standards to make more effective radio protection of life and property on our inland waterways, has been carried forward.

Of major interest in the telephone field was the Commission's recommendations, pursuant to Congressional order, for stricter regulation of the Bell System, an inquiry which brought about telephone rate reductions amounting to \$12,000,000 a year.

Commission records and personnel were utilized by a Senate committee in studying possible merger of existing rival telegraph facilities in the interests of economy and public service.

At the present time the Commission has about 65,000 outstanding radio licenses classified as follows: 800 standard broadcast, 600 broadcast other than standard, 400 experimental, 3800 ship, 1800 aviation, 1100 police, 250 forestry, 300 coastal, 800 fixed stations, and nearly 55,000 amateur.

During the year the Commission extended the broadcast license period from six months to one year. Procedure under which hearings are conducted were simplified, and processes leading to final decisions were expedited. In common carrier matters it has co-operated with State regulatory bodies and the National Association of Railroad and Utilities Commissioners. (Radio broadcasting is not common carrier under the Communications Act.)

The Commission now has 27 field offices located throughout the United States and its possessions, augmented by seven monitoring stations, which check all classes of radio apparatus, examine all types of radio operators, and investigate complaints. Under its statute, the Commission cannot censor radio programmes. No licenses of any sort are issued to aliens, and amateurs are not permitted to use secret telegraphic code.

The basic consideration in licensing broadcast stations is public service. As the Commission declared in a recent case: "Just as it may be a powerful instrumentality for public good, so a broadcast station has potentialities of causing great public harm, and it is accordingly imperative that the limited broadcast channels belonging to the public should be entrusted to those who have a sense of public responsibility."

During the year the Commission launched numerous engineering inquiries into techniques and refinements in various branches of communication. Included is an exhaustive study of the effect of sunspots on radio reception, means of reducing interference from electro-medical and like apparatus, better use of directional antennas, and new types of carrier telephone systems.

On Sept. 1, 1939, James Lawrence Fly was appointed Chairman of the Commission. Other members are Paul A. Walker, Norman S. Case, T. A. M. Craven, George Henry Payne, Frederick I. Thompson, and Thad H. Brown.

See COURTS, FEDERAL.

FEDERAL COUNCIL OF THE CHURCHES OF CHRIST IN AMERICA.

An organization established in 1908 by 28 Protestant denominations to act for them in matters of common interest. At the end of 1939 it included most of the major Protestant denominations of the United States.

The total number of communicant members included in the Council's constituency in 1939 was 22,188,422, counting only those 13 years of age and over.

Of the Council's eight departments, the following made a significant contribution during 1939. The department of social service conducted a series of conferences on preparation for marriage and family life; the department of evangelism directed the University Christian Mission in the interest of a spiritual awakening in educational institutions. The department of international justice and good will provided the American participation in an international conference at Geneva, Switzerland, on the relation of the churches to the political

crisis; it also carried on relief appeals in the churches for war sufferers in China and for German refugees. The radio department sponsored 10 religious programs on the air each week. The department of relations with churches abroad participated in the development of plans for a World Council of Churches. The department of research and education issued reports on "Trends in Anti-Semitism in the United States," "The Social Security Act in Relation to Church Employees," and "The Attitude of the Churches toward the War in Europe." A commission for the study of Christian unity presented a plan for the unification of American interdenominational agencies and began a study of unity in foreign missionary work. The *Federal Council Bulletin*, a monthly, continued to be issued as the official organ.

Officers during 1939 were: President, the Rev. George A. Buttrick; vice-president, Dr. John R. Mott; treasurer, Frank H. Mann; and general secretary, the Rev. Samuel McCrea Cavert. National offices are at 297 Fourth Avenue, New York City. An office is also maintained in the Woodward Building, Washington, D. C.

FEDERAL CROP INSURANCE CORPORATION (FCIC). The Federal Crop Insurance Corporation, established as an agency of and within the U.S. Department of Agriculture under the Federal Crop Insurance Act, which was Title V of the Agricultural Adjustment Act of 1938, as approved Feb. 16, 1938, was authorized to insure growing wheat against all unavoidable hazards commencing with the crop planted for harvest in 1939. Nearly 170,000 wheat growers in 31 States paid premiums for "all-risk" insurance on their 1939 crop; indemnities had been paid to more than 52,000 of these growers through Dec. 19, 1939, amounting to approximately 9,500,000 bu. of wheat. At the beginning of the calendar year 1940 some 310,000 premium payments had been received for insurance on wheat planted for harvest in 1940, practically all of which were from winter wheat growers. Spring wheat growers had until Feb. 29, 1940, to insure their 1940 harvest.

Crop insurance premiums and indemnities are computed entirely in terms of wheat, not dollars. For the sake of convenience, wheat growers may pay their premium with a warehouse receipt or cash equivalent representing the number of bushels as computed for the premium payment for the farm. Or the grower may charge the amount of the premium against future payments to be earned under the agricultural conservation program. Premiums paid in by growers are maintained by the Corporation in the form of actual wheat in storage. Indemnities are paid in wheat in the form of a warehouse receipt or in the cash equivalent thereof. The insured may indicate in his claim for indemnity whether he wishes the indemnity to be paid in wheat or in cash, but the Corporation reserves the right to make payment in a form other than that indicated by the insured.

Growers may insure 50 or 75 per cent of the past average yield for their farms. Premium rates and insurable yields are based on the actual or appraised loss and yield data for each individual farm over a uniformly established base period, adjusted to the average loss and yield data for the county in which the farm is located.

The crop insurance program is administered within States and counties by farmer committees, which permits direct contact with the wheat pro-

ducer. Because the program should contribute materially to the general welfare, the costs of administration, including costs of wheat-reserve storage and of research with a view to applying "all-risk" insurance to other crops, are paid from an annual Federal appropriation. For the crop year 1939 these costs amounted to \$4,800,000. The Corporation has an authorized capital stock of \$100,000,000 of which \$20,000,000 has been appropriated by the U.S. Government to operate as a revolving fund to meet losses in years of sub-normal wheat production when indemnities paid out may exceed premiums collected. It is expected that the amount drawn from its revolving fund during these sub-normal years will be recovered by the Corporation during years when production is above normal.

FEDERAL HOME LOAN BANK BOARD (FHLBB). The Federal Home Loan Bank Board administers the following three agencies: (1) The Federal Home Loan Bank System, (2) The Federal Savings and Loan Insurance Corporation, (3) The Home Owners' Loan Corporation. See BANKS AND BANKING; BUILDING.

Federal Home Loan Bank System, The, was created by an Act of Congress in 1932 and is composed of twelve regional banks constituting a central reserve credit system for their member institutions. While the major portion of the membership in the System consists of institutions of the savings and loan type, a number of insurance companies and mutual savings banks are also members.

The banks have obtained their funds, which may be advanced to member institutions on a long and short-term basis, from investments in their stock by their members and the United States Government, by deposits of member institutions, and through the sale of debentures. During the year ending Dec. 31, 1939, the paid-in stock of the Federal home loan banks increased from \$162,712,125 to \$165,718,950 this increase being entirely due to additional members' subscriptions since the United States Treasury made the final payment on the Government's subscription to stock of the banks in 1937. With the retirement on July 1, 1939, of debentures aggregating \$41,500,000 which matured on that date, the amount of debentures outstanding was reduced to \$48,500,000, of which \$25,000,000 mature on Dec. 1, 1940, and \$23,500,000 on Apr. 1, 1943. Members' deposits increased from \$21,900,109 at the beginning of the year to \$29,616,685 on Dec. 31, 1939.

The combined assets of members increased from approximately \$4,400,000,000 on Dec. 31, 1938, to \$4,700,000,000 on Dec. 31, 1939. Outstanding advances decreased during the same period

from \$198,842,438 to \$181,312,991. The total advances made from the beginning of operations to Dec. 31, 1939, aggregated \$581,922,460. The Federal Home Loan Bank Board is authorized by law to charter and supervise Federal savings and loan associations. During the year ending Dec. 31, 1939, the net addition to the number of Federals was 41. Among the members of the Bank System of the savings and loan type 794 are insured state-chartered institutions and 1678 are uninsured state-chartered institutions.

Federal Savings and Loan Insurance Corporation, The, established by the Congress in 1934 as an instrumentality of the United States, was, on Dec. 31, 1939, insuring the safety of investment to a maximum of \$5000 for each of 2,385,975 investors in 1397 Federal savings and loan associations, with assets of \$1,574,314,000, and in 799 state-chartered institutions with assets of \$932,644,000. Each insured institution pays an annual premium of one-eighth of 1 per cent of the total amount of all accounts of its insured members, plus its creditor obligations. On December 31 Corporation assets, consisting primarily of cash and obligations of, or guaranteed by, the United States, totaled \$121,981,942; reserves of \$20,695,366 had been added to the paid-in capital of \$100,000,000 which had been provided for by the Congress.

While the Corporation has authority to prevent the default of an insured institution and to restore an insured institution in default to normal operation by means of a loan or contribution to, or purchase of assets of the association in difficulty, the Corporation must in the event of default and liquidation of an insured institution promptly make available to each insured member thereof either (1) a new insured account in an insured institution not in default in an amount equal to the insured account so transferred, or (2) at the option of the insured member, his insured account as follows: Not to exceed 10 per cent in cash and 50 per cent of the remainder within one year, and the balance within three years from the date of such default. During 1939, 7 losses were settled bringing the total number since the start of the insurance program to 12.

Home Owners' Loan Corporation, The, is a Government agency, created by Congress in 1933 to cope with the crisis in the home-financing field by granting mortgage loans, during the period of the emergency, to distressed owners of non-farm homes. The HOLC has a capital stock of \$200,000,000, fully paid for by the Secretary of the Treasury. It also has authority to issue bonds in an aggregate amount not exceeding \$4,750,000,000. As of Dec. 31, 1939, excluding those bonds called for retirement, the HOLC had a total of \$2,751,000,000 in bonds outstanding, all guaranteed by the United States Government as to both principal and interest.

The Corporation's lending authority lasted three years, June 1933-June 1936. During this period, it loaned \$3,093,000,000 to 1,018,000 home owners. These loans were granted in amounts sufficient to refinance the original mortgage debt, pay taxes, and provide for reconditioning. In no case were they to exceed 80 per cent of the appraised value of the property, or \$14,000. Loans were made at a 5 per cent interest rate, and were repayable on an amortized basis over a period not exceeding 15 years, through regular monthly installments covering both principal and interest. In 1939, Congress authorized the HOLC to ex-

tend the period of repayment to a maximum of 25 years, where, in its judgment, the home owner's circumstances and the condition of the security justify such extension. Also, since Oct. 16, 1939, and until further notice, the HOLC, on payments becoming due on its loans from that date on, has been accepting interest at 4½ per cent, instead of the 5 per cent rate.

Since 1936, when its lending authority expired, the HOLC has been engaged in the collection of the funds it loaned. As of Dec. 31, 1939, foreclosures completed, and those under way, numbered 78,000. Over 63,000 loans had been paid in full. Of the remaining active original loans, 639,000, or 82.5 per cent, were being repaid satisfactorily. The other 17.5 per cent were in varying degrees of default, only a small portion, however, being in any imminent danger of foreclosure. In the handling of the properties it has been obliged to take over, the Corporation's essential interest is that of disposing of them through sale. Pending sale, these properties are rented. Through Dec. 31, 1939, the HOLC had acquired absolute title to 156,000 properties, or 15 per cent of the total number of loans originally granted. It had sold 80,000 of these properties, 46,000 of them having been disposed of during the year 1939. Of the 77,000 units in HOLC properties available for rental, 90.7 per cent were rented. See SUPREME COURT.

FEDERAL HOUSING ADMINISTRATION (FHA). See BUILDING; HOUSING.

FEDERAL LAND BANKS. See FARM CREDIT ADMINISTRATION.

FEDERAL LOAN AGENCY. The Federal Loan Agency was created by the President's Reorganization Plan No. 1, of Apr. 25, 1939, pursuant to the Reorganization Act of 1939, which Act says that the President shall investigate the organization of all agencies of the Government and determine what changes are necessary to accomplish the following purposes: (1) to reduce expenditures; (2) to increase efficiency; (3) to group, co-ordinate, and consolidate agencies according to major purposes; (4) to reduce the number of agencies by consolidating those having similar functions and by abolishing such as may not be necessary; and (5) to eliminate overlapping and duplication of effort.

In order to carry out the purposes of the Reorganization Act of 1939, the President found it necessary and desirable, among other things, to group under the Federal Loan Agency the following agencies of the Government established from time to time for the purpose of stimulating and stabilizing the financial, commercial, and industrial enterprises of the Nation: Reconstruction Finance Corporation, Electric Home and Farm Authority, The RFC Mortgage Company, Disaster Loan Corporation, Federal National Mortgage Association, Federal Home Loan Bank Board, Home Owners' Loan Corporation, Federal Savings and Loan Insurance Corporation, Federal Housing Administration, and Export-Import Bank of Washington.

The head of the Federal Loan Agency is the Federal Loan Administrator. The Administrator, who is appointed by the President by and with the advice and consent of the Senate, supervises the administration, and is responsible for the co-ordination of the functions and activities, of the agencies named above.

FEDERAL SAVINGS AND LOAN INSURANCE CORPORATION. See FEDERAL HOME LOAN BANK BOARD.

FEDERAL SECURITY AGENCY. The Federal Security Agency was created on July 1, 1939, under the President's first reorganization plan. In the interests of efficiency and economy there were brought together five organizations concerned with the related problems of health, education, and social and economic security: the Social Security Board, the Public Health Service, the Office of Education, the National Youth Administration, and the Civilian Conservation Corps. Also the United States Employment Service and the Social Security Board's Bureau of Unemployment Compensation were consolidated to form a new Bureau of Employment Security.

The Public Health Service, oldest organization in the Federal Security Agency, had its inception in the Marine Hospital Service, established in 1798 for the care of American seamen. In 1912 Congress changed its name to the Public Health Service. The facilities of the Service have been increasingly employed to encourage the development of State and local health services. The Social Security Act, passed in 1935, provided grants of Federal funds to the States for this purpose. Another important activity of the Service is its scientific research work, the results of which are made available to both public and private organizations.

Three of the organizations are concerned with promoting educational opportunities. The Office of Education, an outgrowth of the National Department of Education established in 1867, serves as the clearing house for data on educational procedures and school administration and conducts research on educational problems.

It also administers the programs for vocational education and vocational rehabilitation, which provide Federal grants to States for vocational education in schools and vocational training of persons who are disabled.

The Civilian Conservation Corps was established in 1933 to provide useful employment and training for young men, who because of economic conditions are unable to find work or continue their schooling.

In 1935, the National Youth Administration was established to provide work experience and training for young people between the ages of 16 and 25 no longer attending school full time and not regularly employed. Later it was given administrative responsibility for student-aid projects, under which needy young people are given financial assistance to enable them to continue their schooling in exchange for part-time work.

The Social Security Board, also established in 1935, is the largest organization in the Federal Security Agency. It administers the provisions

of the Social Security Act dealing with old-age and survivors insurance, employment security, and public assistance. The first two of these programs are social insurance systems for wage earners; the benefits payable under them are based on the wage earner's own work and earnings and are paid as a right regardless of what other resources he may have. Public assistance provides cash allowances for three groups of the needy unable to support themselves: the aged, the blind, and dependent children.

Together the programs administered under the Federal Security Agency represent a comprehensive group of services to meet Nation-wide needs. Through them the Federal Government is meeting its obligation to safeguard the general welfare of all the people. See CIVILIAN CONSERVATION CORPS; EDUCATION; EDUCATION, OFFICE OF; EMPLOYMENT SERVICE, U.S.; NATIONAL YOUTH ADMINISTRATION; PUBLIC HEALTH SERVICE; SOCIAL SECURITY BOARD.

PAUL V. McNUTT.

FEDERAL SURPLUS COMMODITIES CORPORATION (FSCC). Inauguration of the surplus food order stamp plan and expansion of the free school lunch program were significant developments during 1939 in Federal Surplus Commodities Corporation activities, which are designed to broaden market outlets for farmers and to encourage increased consumption of agricultural surpluses.

A program under which agricultural surpluses are purchased by the Corporation and distributed to the needy and unemployed through State welfare agencies, has been carried out since 1935 as the principal method of reaching these objectives. The stamp plan grew out of the search for still more effective ways of expanding the domestic market for agricultural producers, and at the same time combating malnutrition among millions of the country's consumers. Under the stamp plan program, which operates in designated cities and areas, increased buying power is given to eligible low-income families for use in purchasing, through normal channels of trade, commodities officially listed as being "in surplus."

The stamp plan works as follows: Studies indicate that persons getting public assistance spend an average of about one dollar a week per person for food. On a voluntary basis such persons may buy a minimum of one dollar's worth of orange stamps a week for each member of the family. These are good for any food at any grocery store. Persons buying orange stamps receive half again as many blue stamps free. The blue stamps take the place of the commodities they formerly got at food depots and are good at any grocery store for foods found to be "in surplus" by the Secretary of Agriculture. (The foods "in surplus" are chiefly dairy and poultry products, fruits, and vegetables; meats could easily be handled by this method if it became necessary.) Grocers paste the stamps, each worth twenty-five cents, on five-dollar cards and redeem them largely through their banks. The Government pays the banks for both orange and blue stamps, the blue ones being redeemed from the same funds used to purchase surplus commodities directly. Persons receiving public aid can thus get surplus foods at the corner grocery store, and they will have seven and one-half cents instead of five to spend for each meal.

The stamp plan program was inaugurated in Rochester, N. Y., in May, 1939. After experimen-

tal operation in this and five other cities, results were encouraging enough to warrant gradual expansion to other areas throughout the country. By the end of December, 1939, 35 areas had been designated for stamp plan operation, and plans had been made for extension of the program to possibly 100 additional areas by July 1, 1940.

During the fiscal year ending June 30, 1939, more than 1,900,000,000 pounds of surplus farm commodities, including a wide range of dairy products, fruits, and vegetables, were bought by the Corporation and donated to State welfare agencies for distribution to the needy. These commodities cost approximately \$66,500,000 and were distributed to more than 10,500,000 persons.

The free school lunch program developed into an outstanding feature of the direct purchase and distribution operations. Of the total quantity of surplus products made available to the States during the 1938-39 year, about 29,000,000 lb. were supplied to co-operating agencies for use in free school lunches. At the peak of distribution in the spring of 1939, the school lunches were being served to nearly 900,000 children in 14,000 schools. Further expansion of this program was begun with the opening of the new school year in the fall of 1939.

In addition to the programs for encouraging domestic consumption of farm surpluses, the Corporation operated a program to assist American wheat farmers in maintaining their fair share of the world wheat market. This program was operated in conjunction with a flour export program. Together, the programs assisted in moving 94,000,000 bu. of the 118,000,000 bu. of wheat and wheat in the form of flour which were sold for export during the 1938-39 fiscal year.

The Federal Surplus Commodities Corporation is an agency of the United States Department of Agriculture. It is a non-profit, membership corporation without capital stock, and was organized Oct. 4, 1933, under the laws of Delaware as the Federal Surplus Relief Corporation. The change to its present name was made Nov. 18, 1935. Funds derived from a sum equivalent to 30 per cent of the gross customs receipts of the previous year, as designated by Section 32, Public No. 320, approved Aug. 24, 1935, and additional funds appropriated by Congress, are provided to carry on the various activities of the Corporation.

MILO PERKINS.

FEDERAL TAXATION. See TAXATION.

FEDERAL THEATER PROJECT. See RELIEF.

FEDERAL TRADE COMMISSION (FTC). The Federal Trade Commission is an agency of the Federal Government, created by Congress in 1914 upon the recommendation of President Woodrow Wilson as an expert body in the field of business practices, to prevent those methods of competition which are harmful to the public and to industry. It administers the provisions of the Federal Trade Commission Act, the Export Trade Act, and certain sections of the Clayton Act, and is composed of five commissioners appointed by the President for terms of seven years. The Commission is bi-partisan, since no more than three of its members may be affiliated with any one political party; and is an independent agency, in that it is not supervised or controlled by any other department of the government.

While its duties also include prevention of such price discriminations, stock acquisitions of competitors and exclusive dealing contracts as are unlawful, the bulk of the Commission's work is carried on pursuant to Section 5 of the Federal Trade Commission Act, which declares "unfair methods of competition in commerce" and "unfair or deceptive acts or practices in commerce" to be unlawful, and sets up administrative machinery (resembling somewhat that of the equity courts) by which the Commission is directed to prevent continued use of such unlawful conduct by means of orders to cease and desist. The Wheeler-Lea Act of March, 1938, the first direct amendment to the original law of 1914, vested the Commission with special powers to prevent dissemination of false advertising of food, drugs, curative devices, and cosmetics, and made certain other changes largely of a procedural nature.

Congress framed the legal test of business practices in broad outline, and did not attempt in Section 5 to enumerate specific practices declared unlawful. The Commission has held many different practices to be unfair and unlawful under this section, including combination to restrain commerce by way of fixing prices, or by boycott; misrepresentations by sellers of the nature of their goods; false advertising of various sorts; disparagement of competitors; commercial bribery; lottery merchandising schemes; short-filling of containers; fictitious price marking; use of misleading trade names; simulation of a competitor's goods or trade-mark; etc.

Commission orders are not aimed to settle private controversies between competitors, but rather to protect the larger interests of the public and honest business from the activities of the unscrupulous.

In addition to the formal procedure, an important method of prevention is found in trade practice conferences sponsored by the Commission for the purpose of promulgating rules, by which entire industries may simultaneously abandon unfair or deceptive practices, and elevate their standards of business conduct on a voluntary and co-operative basis.

Under Section 6, the Commission conducts general investigations upon request of Congress, the President, or the Attorney General, and it has reported upon almost every industry of any importance. Commission investigations such as those into the meat-packing industry, the grain trade, electric and gas utilities, and chain stores have contributed to enactment of both state and federal legislation of large benefit to the public.

R. E. FREER.

FEDERAL WORKS AGENCY. Created July 1, 1939, under Reorganization Plan Number 1, the Federal Works Agency has under its general supervision most of the major construction activities of the Federal Government. The Federal Works Agency is under the direction of Administrator John M. Carmody.

The Federal agencies grouped under the new Federal Works Agency include the Work Projects Administration, the Public Works Administration, the Public Roads Administration, the United States Housing Authority, and the Public Buildings Administration. Each of these constituent agencies is headed by a Commissioner, with the exception of the United States Housing Authority, which is under an Administrator. They are all under the direction and supervision of the

Federal Works Administrator. This group of agencies are concerned with public works, with grants and loans to state and local governments, and with construction practices and standards.

For the fiscal year ending June 30, 1940, the Work Projects Administration (q.v.) has an appropriation of \$1,477,000,000 to provide work for needy persons on useful public projects. It has been estimated that this will provide an average monthly employment of approximately 2,000,000 persons.

The Public Works Administration (q.v.) in the fall of 1939 passed the peak of its construction programme. Unless Congress makes appropriations for further programmes of loans and grants to state and local governments for useful public works, the Public Works Administration will be gradually liquidated as the various construction projects which it has helped to finance are completed.

The Public Roads Administration carries forward a number of road programmes. A large portion of the work is done co-operatively with the State Highway Departments. These programmes include a Federal-aid highways system for which \$115,000,000 is authorized for the fiscal year ending June 30, 1941; secondary or farm-to-market roads, for which \$15,000,000 is authorized, and the elimination of hazards at grade crossings, for which \$30,000,000 is authorized.

The major purpose of the United States Housing Authority is to assist local public housing authorities to remedy unsafe and insanitary housing conditions. It administers grants-in-aid and loans to these local authorities for slum clearance and for the construction of low-rent housing. This is a portion of the housing field which private enterprise has been unable to reach with a profit. An \$800,000,000 programme is under way.

The Public Buildings Administration is responsible for the construction, repair, and maintenance of most Federal buildings, both inside and outside of the District of Columbia. Among the large Federal structures whose construction is being undertaken are the new Social Security Building and the new building for the War Department. See SCULPTURE.

The Federal Works Agency, by co-ordinating the activities of these five agencies is eliminating overlapping, reducing administrative costs, and improving the efficiency of their construction programs. These programmes provide needed employment on useful public works and by expenditures for materials and wages help to sustain industry and commerce. See UNITED STATES under *Administration*.

JOHN M. CARMODY.

FEDERATED MALAY STATES. The four British-controlled States (Negri Sembilan, Pahang, Perak, Selangor) of the Malay Peninsula. Their areas and populations are given in the accompanying table.

| State | Sq. mi. | Pop (1938) | Capital |
|--------------------------|---------|------------|--------------|
| Negri Sembilan | 2,580 | 281,089 | Seremban |
| Pahang | 13,820 | 209,317 | Pekan |
| Perak | 7,980 | 938,421 | Taiping |
| Selangor | 3,160 | 661,008 | Kuala Lumpur |
| Federated Malay States | 27,540 | 2,089,835 | Kuala Lumpur |

Chief towns (with 1937 populations): Kuala Lumpur, the capital (136,068), Ipoh (64,343),

Taiping (38,083), Seremban (27,363), and Klang (27,030). During 1937 there were 74,196 births (37.8 per 1000) and 39,031 deaths (19.9 per 1000). The 1477 schools (English, Malay, Chinese, and Tamil) had 125,615 students enrolled (1937); in addition, there were technical and trade schools maintained by the government.

Production and Trade. The main industries consist of agriculture and mining. Rubber, coconuts, rice, oil palms, tapioca, coffee, pineapples, areca nuts, tobacco, timber, gold, tungsten, ilmenite, and coal are the principal products. The forests produce, in addition to fine timbers, gutta percha, gums, oils, resins, and canes. Livestock (1937): 61,859 oxen, 57,502 buffaloes, 122,738 goats, 10,000 sheep, and 251 horses. In 1937, imports were valued at S\$131,101,350 (the chief items were rice, gasoline, cotton yarns and manufactures, and machinery); exports, including re-exports totaled S\$357,247,152 (rubber S\$171,258,400, tin and tin ore S\$151,418,742, copra S\$9,530,347). The Straits dollar (S\$) averaged \$0.5797 in 1937; \$0.5692 in 1938; \$0.5174 in 1939.

Communications. In 1938 there were miles of paved roads, 1525 miles of bridge paths, and 1068 miles of meter-gauge railways owned or leased by the government. Shipping aggregating 7,231,567 tons (excluding steamers of 75 tons net register and under, and native craft), entered and cleared Port Swettenham.

Government. Budget estimates (1939): revenue, S\$60,322,098; expenditure, S\$74,019,647. The resolution, introduced by the rulers of the four States, to offer a contribution of S\$4,000,000 to the cost of Imperial defence was unanimously approved by the Federal council on May 18, 1939. The Federated Malay States, which are under the protection of Great Britain, are governed in matters common to them all by a Federal council comprising the Governor of the Straits Settlements (who is ex officio high commissioner) as president, 15 government officials, and 12 unofficial members nominated by the high commissioner. Each of the four States has a native ruler who is subject to the advice of a British Resident. State councils may legislate in purely local matters. High Commissioner, the Governor of the Straits Settlements—Sir Shenton Thomas (appointed, 1934).

History. The crowning of the new Sultan, Sir Hisamud-din Alam Shah, took place at Klang toward the end of January of 1939. After being washed with holy water and rice paste and anointed, the Sultan and Sultana entered the throne-room of the palace to be crowned by the Sultan's elder brother who was formerly a claimant to the throne. The installation of Sir Abdul Aziz as 31st Sultan of Perak took place at Kuala Kangsar on Mar. 3, 1939.

FERTILIZERS. Among especially noteworthy developments with regard to fertilizers in 1939 were increase of knowledge of the actual and potential supplies of raw materials, especially phosphates, and synthetic products available for fertilizer use in the United States; improvement of the quality of manufactured fertilizers; more efficient use of fertilizers for special purposes; and possible effect of disturbed world conditions on the fertilizer trade.

Recent inquiries have shown that the United States is even more abundantly supplied with phosphates than previous estimates had indicated

and, if necessary, could become self-sustaining with regard to potash and nitrogen.

The very earnest effort of agronomists and manufacturers to improve the quality of mixed fertilizers remained unabated. The effect of this effort is strikingly shown in the fact that whereas in 1928 7,985,000 tons of fertilizers containing 1,357,000 tons of plant food were used in the United States at a cost of \$275,000,000, in 1938 7,504,000 tons containing 1,380,000 tons of plant food were used at a cost of \$192,000,000. A recent study of fertilizer prices in this country shows that they are now about one-fourth lower than they were in 1929, as measured by actual plant food content.

The possible effect of the present war conditions on the fertilizer trade is not now clearly apparent. So far it has not been very marked, although exports of phosphates to Germany, which is the largest customer of the United States for this product, are reported to have already been disturbed by the British blockade.

The Bureau of Foreign and Domestic Commerce of the U.S. Department of Commerce states that the imports of fertilizer materials have been steadily declining during the past 10 years. Receipts of chemical nitrogen products fell from 1,314,396 long tons in 1928 to 914,511 tons in 1938, of natural organics from 305,152 to 139,206, chemical phosphates from 50,388 to 29,835, chemical potash from 841,550 to 326,730, while the total of the group for ammonium phosphate, potassium nitrate, and compound and mixed fertilizers rose from 19,061 to 122,900 tons.

Phosphates. Hearings were held by the Congressional Committee on phosphate reserves¹ at Washington and in the various phosphate-bearing areas of the country in 1939. Pursuant to the joint resolution of Congress, the committee undertook to study "(1) the use and service of phosphate to American agriculture; (2) the domestic consumption and exports of phosphate; (3) the adequacy of the supply of phosphate to the United States; (4) the development of phosphate deposits in the Western States; and (5) methods of conserving phosphate resources of the United States." The findings of the committee and the testimony of experts indicated a reserve of some 3,000,000,000 tons of high-grade rock in Florida and perhaps 20,000,000,000 tons of lower grade phosphate which might be added to the available reserve. The Tennessee area appears to have at least 200,000,000 tons of high-grade rock in reserve with an undetermined but very large supply of low-grade rock and phosphatic limestone that might be utilized with modern methods of recovery. Apparently the previously estimated western reserve of 6,500,000,000 tons may be multiplied by three. It has been estimated that the United States has a sufficient supply of phosphate to last for at least 3000 years at the present rate of consumption. However, the Secretary of Agriculture calls attention to the significant fact that "we lose each year in the United States about 2,000,000 tons of the element phosphorus in the crops as they are taken off the soil, and another 2,000,000 tons in the soil that is carried off by erosion, a total loss of 4,000,000 tons of phosphorus. Our supplies are very great, but our loss is also very great, and now that we are maturing

as a nation it is undoubtedly high time that we approach the subject carefully and thoughtfully."

Under the Domestic Allotment Act, the Agricultural Adjustment Administration is authorized to supply superphosphates to farmers as grants in aid. Something over 65,000 tons of superphosphate was so distributed in 1938. It is estimated that 135,000 tons was required for the purpose in 1939 (45,000 tons furnished by the TVA and 90,000 tons by commercial manufacturers).

Further progress was reported by the TVA and the U.S. Department of Agriculture in manufacture and use of concentrated phosphate (especially triple superphosphates).

An effective means of removing fluorine from natural phosphates in which it is always present, impairing their value for the manufacture of superphosphate, has been found in heating the raw rock phosphate to 50° to 170° C. above the melting point in contact with water vapor. This may materially increase the supply of rock phosphate suitable for superphosphate manufacture.

Potash. The potential and actual development of the potash resources of the United States is such that in case of necessity the country may be capable of becoming independent of foreign sources of supply for agriculture. The country now obtains approximately one-third of its supply from foreign sources and two-thirds from domestic sources, which are being steadily developed. It is estimated that operations recently undertaken in California and New Mexico, supplementing the present domestic output, would produce potash sufficient for all domestic needs.

A joint committee of the Association of Land-Grant Colleges and Universities and the U.S. Department of Agriculture reported in some detail during the year on the amount, character, conservation, and proper use of the potash resources of the United States. The findings of the committee indicate that the production of potash in the United States in 1938 was 316,951 short tons of K₂O, imports 180,795, exports 52,052, and apparent consumption 445,694 short tons. Of the total amount all except 5 to 10 per cent was used for agricultural purposes. The report says that "much information is already at hand to show that potassic fertilizers exert a favorable influence on yield and quality, and increase resistance to disease, drought, and frost. Potassium improves the shape, size, color, flavor, storage, and shipping qualities of fruits, tubers, and vegetables, thus increasing their marketability as foods and feeds or as industrial raw materials for the production of clothing, foodstuffs, and beverages," but "much more detailed experimentation is required before the action of potassium can be fully understood and its agricultural use made rational and adapted to the needs of the various soil types and crops."

Potash fertilizers have recently been shown to be effective in preventing or reducing the severity of rice rot and cotton wilt and rust.

Nitrogen. With the progress in fixation of nitrogen of the air in forms suitable for agriculture, it would seem that the United States could in case of necessity dispense with foreign sources of supply.

It is estimated that approximately 14 per cent of the nitrogen used in fertilizers is derived from synthetic ammonia, which furnishes a cheap source of nitrogen and is capable of being rapidly and indefinitely increased to meet emergency demands, particularly in view of the fact that there

¹ U.S. Congress, 75th, 3d sess., Hearings, June 18-Nov. 29, 1938, Pub. Res. 112. Phosphate Resources of the United States. 1939.

are 20,000,000 tons of nitrogen over every square mile of the earth's surface.

Further investigations have confirmed previous conclusions as to the high value of synthetic urea as a source of nitrogen, especially for use in mixed fertilizers. (See also BIOLOGICAL CHEMISTRY.)

Larger quantities of byproduct sulphate of ammonia may be expected to be available with the speeding up of steel production for war purposes, and consequent increased use of blast-furnace coke.

The large amount of experimental data relating to relative efficiency of different forms of nitrogen in fertilizers has recently been summarized as follows: "Water-insoluble organic sources of nitrogen are not readily leached and do not materially increase soil acidity. They have, however, a low total availability as compared to water-soluble forms of nitrogen. This property cannot be corrected by any known means. Nitrate nitrogen is completely available and in the form of calcium and sodium nitrate tends to reduce rather than increase soil acidity. On the other hand, it is very readily leached from the soil. This property of nitrate nitrogen cannot be changed. Leaching losses may be reduced by making two or more applications of fertilizer during the growing season. Ammonium nitrogen is completely available to plants and is not easily leached from the soil. Its one weakness is that, particularly in the form of ammonium salts, it materially increases soil acidity. This acidifying action, however, is easily corrected by the use of limestone. When limestone is used with ammonium nitrogen it is, in most cases, one of the best sources of nitrogen that can be used in fertilizers that are to be applied at planting. Soluble organic nitrogen, urea and the soluble portion of natural organics, is completely available to plants, is resistant to leaching and only slightly increases soil acidity. This form of nitrogen is one of the best that can be used in complete fertilizers. The efficiency of soluble organic nitrogen, however, is frequently increased by the use of small supplements of limestone, preferably dolomite. The cost of nitrogen in complete fertilizer could be reduced approximately one-third by substituting soluble but leaching resistant forms of nitrogen for water-insoluble organic sources."

Applying fertilizers in solution. Applying fertilizers in irrigation water has been found by the California Experiment Station to be a very effective means of utilizing manure leachings and commercial fertilizers in crop production. The New York State Experiment Station has shown that the yield of tomatoes may be greatly increased by dissolving chemical fertilizers, especially soluble phosphates, in water and applying the solution at the time of transplanting, as a starter or supplement to the regular fertilizer treatment. Fertilizers so applied increased the yield of early tomatoes 1.44 tons per acre at a cost of only 48 cents. The widespread interest in hydroponics or so-called soil-less agriculture has probably had something to do with this development.

Activated sludge. An activated sludge of the Milwaukee Sewage Disposal Plant is proving to be an excellent fertilizer, thus offering a useful way of disposing of a product which is a serious problem in sewage disposal.

Fertilizers and quality of crops. Comprehensive and detailed studies of the effect of manure and fertilizers on the quality as well as

the yield of crops are in progress in this and other countries. The results have pointed the way to increased economy and efficiency of fertilizers and improved quality of the crops grown. Judicious use of fertilizers on thin pasture land has been demonstrated to be an effective and profitable means of increasing the returns from such lands.

Fertilizer placement. The most effective placement of fertilizers in the soil continues to receive much attention, especially by vegetable growers, with material saving in cost and increased efficiency. This is of special importance because vegetable growers are heavy users of fertilizers and are dependent upon them to a very great extent for improving both yield and quality.

Mushroom compost. Further investigations by the Pennsylvania Experiment Station on preparation of artificial compost for mushroom culture has shown that the materials for such compost must furnish assimilable carbon compounds as well as mineral plant food and must be free from foreign fungi and bacteria. Clean wheat straw and urea have given good results in such composts.

Fertilizers in fish culture. The use of fertilizers in fish culture seems likely to become of practical importance in this country as it has long been in Germany and other European countries. The Alabama Experiment Station has found that unfertilized fish ponds produce from 100 to 200 pounds of fish per acre, while properly fertilized ponds produce as high as 580 pounds per acre. The most profitable mixture has been found to be 5 pounds of muriate of potash, 40 pounds of sulphate of ammonia, 60 pounds of superphosphate, and 30 pounds of basic slag or 15 pounds of ground limestone per acre of water. The same results were obtained whether the fertilizers were applied separately or in mixture. The fertilizers feed small plants, some microscopic, which in turn furnish food for the fish.

FIJI (fē'jē) ISLANDS. A British colony in the South Pacific, consisting of some 250 islands (80 inhabited) and its dependency—the islands of Rotuma. The largest islands are Viti Levu (4053 sq. mi.), Vanua Levu (2128 sq. mi.), Taveuni (166 sq. mi.), and Kandavu (165 sq. mi.). Total area, including the islands of Rotuma, 7083 square miles; total population (Jan. 1, 1938, estimate), 205,397 (including 99,595 Fijians, 89,333 East Indians, and 4238 Europeans), as compared with 198,379 (1936 census). Chief towns: Suva (capital, on Viti Levu), 15,522 inhabitants; Levuka (on Ovalau).

Production and Trade. The principal products are sugar, copra, molasses, bananas, trocas shell, butter, pineapples, native foodstuffs, and gold. Various timbers are produced from the forests which have a total area of 3696 square miles. Livestock (1937): 70,000 cattle; 20,000 goats; 15,000 horses, asses, and mules; 3000 swine; and 600 sheep. Chief exports (1938): sugar, 134,415 tons valued at £1,338,183; gold, 89,354 oz., £701,272; copra, 33,475 tons, £270,915; and bananas, 16,135 bunches and 149,395 cases, £73,578. In 1938, imports were valued at £1,675,437; exports, £2,535,029. During 1937 some 153 vessels aggregating 944,452 tons entered the ports. There were (in 1938) 2228 miles of roads, and a small gauge

railway of 120 miles from Tavua to Sigatoka.

Government. For 1938 revenue totaled £831,594; expenditure, £782,374; public debt, £1,414,030. The government is administered by a governor (appointed by the Crown) assisted by an executive council of 7 members, and a legislative council (of which the governor is president) of 31 members (16 official, 5 European, 5 native, and 5 Indian). Native administration is carried on through the chiefs subject to the governor's supervision. Governor of Fiji and High Commissioner for the Western Pacific, Sir Harry Luke (appointed June 26, 1938).

History. It was announced during March of 1939 that certain social and economic reforms would be instituted in the islands. Sir Frank Stockdale, chief agricultural adviser to the British Colonial Office, who headed an investigation to Fiji in 1937, recommended, among other things, that the question of sugar-land tenure be given early consideration; that methods of sugar-cane cultivation be improved; that the workers be provided with better housing; and that a credit system be put into effect in order to eliminate moneylenders who prey on the sugar planters. A new government building, which contains a legislative chamber and two law courts in addition to housing various departments of the government, was opened by Sir Harry Luke, the governor, on May 12, 1939.

FINANCE. See BANKS AND BANKING; FINANCIAL REVIEW; INTERNATIONAL BANKING AND FINANCE; PUBLIC FINANCE; MONEY, U.S. STOCK OF; REPARATIONS AND WAR DEBTS; UNITED STATES under *Administration*; and sections under *Finance* in various countries.

FINANCIAL REVIEW. The financial markets in 1939 were called upon to withstand the shock of the outbreak of another major European war. A severe reaction had occurred in the markets during September, 1938, at the time of the pre-Munich crisis. Again, stock quotations declined sharply early in the spring of 1939 when Germany established her protectorate over Bohemia and Moravia. The upturn in business activity during the summer of the year brought a rising trend in the security markets, but it was widely assumed that a declaration of war among the major European powers would again precipitate a great wave of liquidation. While the markets did decline rather rapidly during the week immediately preceding the outbreak of war, the beginning of the German invasion of Poland brought a sharp rally, however, and security quotations rose briskly during the first two weeks of September, numerous issues rising to new high prices for the year or longer.

Several reasons explain the fact that the outbreak of a European war failed to disorganize the financial machinery of the United States in 1939, whereas the beginning of the World War 25 years before forced the closing of the New York Stock Exchange for a period of four and a half months. In the first place, European holdings of American securities in 1939, while substantial, represented a far smaller proportion of the total outstanding than was the case in 1914. The larger part of the foreign capital that flowed into the United States since 1934 has been held here in the form of bank balances, rather than stocks and bonds, and the possible withdrawal of such funds would thus not make necessary the liquidation of securities. Furthermore, the larger part of European holdings of

American securities were owned in neutral countries, so that immediate liquidation was not feared. In the second place, whereas wholesale liquidation by individual investors abroad was feared in 1914, Great Britain and France in 1939 immediately on the declaration of war required the registration of holdings of American securities by their nationals, so that they could halt liquidation and nationalize them if events should prove this necessary to avoid their sale at relatively low prices. A third important factor explaining why the financial markets did not decline because of the outbreak of war in Europe was the sharp upturn in business and commodity prices that resulted from the wave of forward buying that occurred immediately after the outbreak of the war. Whereas, in 1914, business activity and the price level declined for some months after the war began, the reverse occurred this time. Finally, knowing that the World War witnessed an inflationary rise in business profits and a spectacular advance in stock prices, investors and speculators were inclined to expect a repetition on the present occasion.

While the Securities and Exchange Commission watched the markets carefully, and was ready to order the closing of the New York Stock Exchange if trading became disorganized, it was very content to pursue a hands-off policy when it found that action was not needed.

Security Markets. Stock prices fluctuated irregularly during the early months of 1939, when business activity was declining gradually, but a renewed upturn in the latter part of the year was widely expected. The German march into Prague brought a severe decline, however, and the *New York Times* average of quotations of 50 stocks declined from a high of 107.51 in March to a low of 84.79 in April. Thereafter, as business turned upward from the low level of the spring, the security markets rallied, although they remained vulnerable to liquidation whenever the news from Europe pointed to a new political crisis. The spurt in the market which accompanied and followed the declaration of war carried the *New York Times* average to 114.27 on September 13, which was the high for the year. It will be noted, however, that this was only slightly higher than the peak reached by the average in January and March. Thereafter, although business continued to rise briskly, and the Federal Reserve Board's adjusted index of industrial production reached an all-time peak of 128 in December, stock prices reacted and the market fluctuated irregularly during the remainder of the year moderately below the high point of the September upturn. The failure of the stock market to continue to advance in the face of extremely favorable business news and corporate earnings prospects was due primarily to the growing conviction that the high level of industrial activity, which reflected in part inventory accumulation, could not last long, and investors were inclined to discount at least a moderate decline in business in planning their commitments. Contributing factors tending to restrain the stock market were liquidation from Great Britain, where holders could sell their American securities with the approval of the financial authorities, and selling to realize tax losses in many issues in the closing weeks of the year.

High and low figures for the *New York Times* average for each month of the year are shown in the table on p. 270.

The outbreak of a major war brought spectacular advances in issues of companies producing war

supplies and materials, such as aircraft manufacturers, some steel manufacturing companies, etc. At the same time, very sharp increases occurred in quotations of stocks of companies producing raw materials whose prices rose sharply because of the war, such as sugar and some mining companies. However, the upturn in business was so broad and vigorous that the rise quickly embraced other groups. Furthermore, the reaction that occurred in prices of many commodities, particularly sugar, caused severe subsequent reactions in quotations of many such stock issues. The Neutrality Act debate affected the market for aircraft and shipping stocks for a time, but both these groups were more successful in retaining their initial advances to the end of the year than most others.

The high, low, and closing prices of the most active stocks listed on the New York Stock Exchange, for 1939, were as follows:

PRICES OF THE MOST ACTIVE STOCKS

| Stock | High | Low | Close |
|--------------------|--------------|--------------|-------|
| U.S. Steel..... | 82½ Sept 12 | 41½ Aug 24 | 66½ |
| General Motors.. | 56¼ Oct. 26 | 36¾ April 11 | 54½ |
| Loft..... | 21¼ July 22 | 6 March 31 | 18½ |
| Curtiss-Wright... | 13¼ Nov. 4 | 4¾ Aug. 24 | 10½ |

Sales on the New York Stock Exchange for 1939 aggregated 262,029,599 shares, as compared with 297,466,722 shares in 1938. Sales of bonds on the Exchange totaled \$2,046,083,000, which compared with \$1,859,865,000 in 1938. The total value of all listed stocks on December 31, 1939 was \$46,467,616,000, as against \$47,490,794,000 a year before.

High grade bond prices were strong during the first eight months of the year, reflecting the persistent demand from banks and insurance companies which had large surpluses of funds for investment. A sharp reaction occurred in September, owing to the fear that the war might cause a rise in interest rates, but on more sober reflection it was generally recognized that, with the gold inflow continuing and with this country remaining at peace, the chief influence in the bond market would continue to be the large surplus of funds available for investment. Therefore, gilt edge bonds generally were close to the high prices of the year at its close. Middle grade and speculative bonds participated in the broad advance on the stock market during September, and in many instances ended the year with gains.

The course of corporate bond prices, as measured by indices of the Standard Statistics Company, was as follows:

AVERAGES OF BOND PRICES

| | Total | Industrial | Corporate Railroad | Utility |
|--------------------|-------|------------|--------------------|---------|
| Number of issues.. | 60 | 20 | 20 | 20 |
| 1939—January.... | 81.9 | 86.2 | 59.7 | 99.7 |

| December..... | 82.1 | 86.8 | 58.0 | 101.6 |

Stock Exchange Regulation. The combination of a relatively small turnover of securities, which made operations unprofitable except during the brief war rise, and constant pressure from the Securities and Exchange Commission for further reforms caused growing resistance to the SEC on the part of the financial community during the year. The first break in the era of good feeling that was ushered in by the election of William McC. Martin as the first salaried president of the New York Stock Exchange on June 30, 1938, was the appointment of a special committee of members of the New York Stock Exchange to study the Federal security legislation as a whole, with a view to its improvement, on June 17. This committee conferred with representatives of 15 other security exchanges in Washington, and formulated a program of proposed modifications of the law and the regulations issued by the Commission thereunder in order to "equalize competitive conditions affecting securities traded in over-the-counter and securities listed on organized exchanges." The SEC unanimously rejected these recommendations, but they were ratified nevertheless by the Board of Governors of the New York Stock Exchange several days later. The breach between the SEC and the New York Stock Exchange was widened in June when Jerome N. Frank, the newly appointed chairman of the Commission, urged that the Exchange set up a brokerage bank to hold the cash and securities of customers, for their greater protection, and threatened increased direct regulation of member firms by the SEC as an alternative. The Stock Exchange countered with the publication of an adverse report on the brokerage bank proposal by the accounting firm of Haskins and Sells.

The Stock Exchange finally made clear its intention of escaping domination of its management by the SEC through the appointment of a public examining board of leading financiers and industrialists on July 14. This board, which published its report on August 31, made fourteen specific recommendations, including increased capital requirements for member firms, a strengthening of their audit procedure, the separation of underwriting from the commission business, and the establishment of a reserve fund for the Exchange. In addition, it stated that member firms had to have larger revenues, in view of the small turnover, to put their business upon a sound basis, and urged the imposition of service charges on a uniform basis to accomplish this result. In connection with the publication of this report, the president of the Exchange significantly pointed out that it marked the "completion of a broad program begun more

than eighteen months ago with the formation of the Conway Committee," and that henceforth the Exchange management would be concerned with rehabilitating the earning power of the brokerage business, rather than with new reforms. Active steps to establish compulsory service charges on brokerage accounts that had no debit balances were being launched by the close of the year.

The SEC continued to perfect its regulation of the over-the-counter markets through a system of self-policing by the National Association of Security Dealers, to which all dealers, except those concerned with municipal bonds, were to belong. The publication of the very extensive report on investment trusts was continued through the year, but no bill to extend regulation to such institutions was prepared.

New Financing. The volume of new financing was larger in 1939 than in 1938, but this was due entirely to the increase in refunding activity with the rise in high grade bond prices to unprecedentedly high levels. The failure of industry as a whole to seek new capital through the security markets in a volume comparable to that of the twenties was one of the major topics studied by the Temporary National Economic Committee. However, because its hearings on this question threatened to assume a political flavor, since they reflected on the pump-priming activities of the Administration, the committee interrupted them when they came to grips with this problem, after a promising start, and instead sought to restrict

poses. The public offerings of new corporate securities, by months, are shown in the table in the preceding column.

The Federal government, despite its huge deficit, raised only \$1,320,000,000 of new funds, apart from refunding operations, through public offerings of direct and guaranteed obligations during 1939, as compared to \$1,180,000,000 in 1938. This total is exclusive of its sales of United States savings bonds, which yielded \$767,000,000 in additional funds during the year. The character of the financing for State, municipal, Federal agency, and corporate account during the year is shown in the table below.

The increased volume of new construction in 1939 expanded the supply of real estate mortgages coming on the market, which were readily absorbed by life insurance companies, savings and loan associations and banks. F.H.A. insured mortgages continued to meet a ready demand, while the U.S. Housing Authority sponsored issues of bonds by local authorities to finance the Federal slum clearance program.

A scarcity of high grade bonds available for institutional investment again gave rise to a large number of private placements, by which one or a few institutions took over an entire issue of bonds directly from the issuer. Furthermore, several life insurance companies actively sought to make capital loans to individual enterprises in competition with commercial banks.

International Capital Movements. The flight of nervous money to the United States assumed record proportions during the year as a result of the series of acute political crises which culminated in the war. The inflow of capital into this country from abroad was greatly accelerated beginning with March, when the German occupation of the remainder of Czecho-Slovakia caused a heavy inflow of funds from Europe. During the late spring and early summer, the inflow of capital declined sharply, but the crisis immediately preceding the outbreak of war brought a new heavy flow of funds. During the first nine months of the year, the net movement of capital into the United States, as reported by the Treasury Department, aggregated \$1,179,000,000. Details of this influx of capital from abroad, now made available monthly in the Treasury Department Bulletin, are summarized in the table on p. 272.

This flight of capital caused net imports of gold into the United States to exceed \$3,500,000,000 during 1939 for the first time in history. The bulk of this gold came from the United Kingdom and represented both heavy transfers of capital from Great Britain to the United States and shipments

of newly produced gold and gold emanating from the monetary stocks of other countries through London's financial machinery. There was also considerable transfer of gold to this country by other central banks which wished to keep part of their reserves here under earmark, to escape the threat of confiscation by an invader. The sources of the gold imports received by the United States during the year, with comparisons with preceding years, are shown in the table below.

The enormous gold imports caused the mone-

postponing changes in the monetary policy of the United States, and particularly the unlimited purchase of gold by the Treasury at \$35 per oz., until that time.

* Preliminary

tary gold stock of the United States to increase by leaps and bounds. As upwards of 60 per cent of the monetary gold supply of the world is now held by the United States, the question was widely asked whether it could be hoped that the world's gold would ever be redistributed and the monetary systems of the major nations restored to a gold standard. A protracted European war, it was widely assumed, would cause a very large part of the balance of the monetary gold supply of the world to come to the United States. However, since a cessation of gold purchases would tend to raise the value of the dollar in the foreign exchange markets and thus exert a deflationary effect upon some commodity prices and economic conditions in this country, and since Great Britain and France relied upon their ability to sell gold to this country to finance purchases of needed materials and supplies in the event of a long war, the Administration preferred to suspend consideration of remedial action until some future date. Furthermore, it was widely felt that, until the end of the war, it was not possible to determine what course the monetary policies of other countries would take, so that there was much to be said for

Area and Population. Finland has a land area of 134,547 square miles and a population (Jan. 1, 1938, estimate) of 3,834,662 (3,667,067 at the 1930 census). Of the 1938 population, 3,008,814 lived in rural and 825,848 in urban communities. Finnish-speaking inhabitants (1936) comprised 89.4 per cent of the total; Swedish-speaking, 10.1 per cent. Living births in 1937 numbered 72,319 (20.0 per 1000); deaths, 47,150 (13.1 per 1000); marriages, 32,464 (9.0 per 1000). Estimated populations of the chief cities in 1937 were: Helsinki (Helsingfors), 293,237; Viipuri (Viborg), 73,917; Turku (Åbo), 72,981; Tampere (Tammerfors), 74,736; Vaasa (Vasa), 32,108; Oulu (Uleåborg), 27,224; Lahti, 25,714; Kuopio, 24,691; Kotka, 21,448; Pori (Björneborg), 20,974. ish place names are given above in parentheses.

National Defense. Military service is compulsory and every citizen is liable to service from the age of 17 to 60. See *EUROPEAN WAR* for statistics.

Education and Religion. The population of school age (7 to 15 years) was 590,417 in 1936. School attendance was: Primary, 480,413 in 1936-37; secondary, 50,580 in 1936-37; university and schools for higher education, 8214 in 1937-38. Less than 1 per cent of the adult population was illiterate in 1930. The population on Jan. 1, 1937, included 3,654,751 Lutherans, 70,445 Greek Catholics, 9909 Baptists and other evangelical church members, 1541 Roman Catholics, 1756 Jews, and 347 Moslems.

Production. About 6,368,000 acres (7.5 per cent of the total area) were under cultivation in 1937. (Agriculture engaged 60 per cent and industry 16.8 per cent of the working population at the 1930 census.) Crops harvested in 1937 were valued at about 7,025,000,000 marks. Yields of the chief cereals in 1939 were (in metric tons): Wheat, 227,000; barley, 192,020; rye, 331,000; oats, 798,000. The 1938 potato crop was 44,014,000 bu.; flax and hemp, 2,218,000 lb.; hay (1937), 3,795,000 metric tons. Livestock statistics for 1937 were: Cattle, 1,925,000; sheep, 1,072,000; goats, 10,000; swine, 504,000; horses, 380,000; reindeer, 100,000; poultry (1936), 2,888,000. Animal products in 1937 were: Butter, 29,700 metric tons; cheese, 9500 metric tons. Some asbestos, copper, gold, lead, peat, zinc, and nickel are mined. See under *History* the account of the Petsamo nickel mines.

Forests are a great source of wealth. Growing stock of timber in 1939 was estimated at 57,214,000,000 cu. ft.; merchantable timber, 1,557,000,000 trees (60.7 per cent pine, 28.1 per cent spruce; remainder deciduous, mostly birch); annual increment, about 1,568,000,000 board ft.; annual fellings, about 1,413,000,000 board ft.

Industrial production in 1937 was valued at 21,076,000,000 marks. The principal products were: Wood pulp, 2,131,000 metric tons; paper, 762,000 metric tons. Chemical wood pulp output, 1938, was 1,442,000 metric tons. Other chief products with their 1936 output were: Lumber, 2,386,000 bd. ft.; spools (for thread), 3,879,000 gross; shoes and galoshes, 4,310,000 pairs; cotton yarn and fabric, 24,923,000 lb.; bricks, 121,053,000; matches, 369,701,000 boxes; cigarettes, 3,620,000,000; margarine, 25,889,000 lb. The total number of registered unemployed in January, 1939, was 21,502 as compared with 17,778 in December, 1935, the last previous tabulation (winter unemployment is mostly seasonal). Unemployed in August, 1939, totaled 2466.

Foreign Trade. General imports in 1938 totaled 8,612,300,000 marks (9,306,423,000 in 1937) and general exports were 8,431,000,000 marks (9,379,724,000 in 1937). The United Kingdom supplied 22 per cent of the 1938 imports by value, Germany 20, Sweden 13, and the United States 9. Of the exports, 44 per cent went to the United Kingdom, 15 to Germany, and 9 to the United States. See *IMPORTS AND EXPORTS*.

Finance. The budget estimates for 1940 placed revenue at 5,767,300,000 marks; expenditure, 5,752,000,000 marks; as compared with revenue of 5,666,400,000 and expenditure of 5,743,600,000 in 1939. The Minister of Finance announced (Sept. 1, 1939) that recent international events would probably make it necessary to revise the 1940 budget estimates. Actual revenue for 1938 totaled 5,534,-

700,000 marks; expenditure, 5,432,800,000 marks. The public debt was 3,371,327,152 marks on Dec. 31, 1938.

The Finnish mark after 1931 was linked to the pound sterling at the rate of 227 marks to £1. On Aug. 28, 1939, the Bank of Finland announced that the mark would be pegged instead to the U.S. dollar at the rate of 49.35 marks to \$1. The mark averaged \$0.0218 in 1937; \$0.0216 in 1938; and \$0.0199 (nominal) in 1939.

Transportation. The railway mileage in 1939 was 5107 miles (mostly operated by the state). There were two long south to north main lines from Kotka to Kontiamaki and from Helsinki to Kauliranta. West of Torino a railway bridge crossed the frontier river and connected with the Swedish town of Haparanda. A third railway ran from Viborg through Nurmee to Uleåborg (Oulu). The three above-mentioned railroads were connected by two east to west lines from Viborg to Richimaki and Elisenvaara to Haapamaki. The only railway connection with Russia was at Rajajoki, 214.4 miles from Helsinki on the Viborg-Leningrad line. Smaller state and private lines feed the larger railways, especially along the Baltic and the Gulf of Bothnia. The state lines in 1938 carried 22,380,000 passengers and 13,731,189 metric tons of freight; the gross receipts totaling 1,075,281,233 marks. Highways and roads aggregated 39,631 miles in 1939 (see *ROADS AND STREETS*). The highway budget for 1939 amounted to 305,800,000 marks. In 1939 there were three civil air services covering 741 route miles. The gross tonnage of the Finnish merchant marine on June 30, 1938, was 579,600. The tonnage of vessels entering Finnish ports with cargo in 1938 was 3,648,000; cleared, 5,100,000.

Government. Under the Constitution of July 17, 1919, executive power is vested in a president elected for six years by 300 electors, chosen by direct suffrage in the same manner as members of the Diet. Legislative power rests with the unicameral Diet and the President. The 200 members of the Diet are elected by direct vote of all citizens, male and female, 24 years or more of age. The cabinet is appointed by the President, but is responsible to the Diet. President in 1939, Kyösti Kallio, who assumed office Mar. 1, 1937. Premier at the beginning of 1939, Aimo Kaarlo Cajander (National Progressive), heading a cabinet comprising representatives of the Social Democratic, Agrarian, and National Progressive parties. For changes in 1939, see *History*.

HISTORY

The threat of a Soviet attempt to reconquer Finland had hung over the little republic ever since it broke away from Bolshevik Russia on Dec. 6, 1917. On Nov. 30, 1939, this threat became a reality when the Moscow government, after vain efforts to obtain what amounted to a protectorate over the Finns, launched an attack upon them by land, air, and sea. Finland met the attack with courage and skill and at the end of the year was holding its own everywhere except in the air; there Russian planes, operating virtually unopposed, were turning Finnish cities into shambles with repeated bombing raids. For a full description of the Russo-Finnish war, see *EUROPEAN WAR* under *The Russian Front*.

Defense of Åland Islands. Fearing that Finland's strategic position might again make it the battleground of hostile German and Soviet forces, and anticipating a German-Russian race to seize

control of the Åland Islands at the entrance to the Gulf of Bothnia, the Finnish Government in 1938 speeded up defensive preparations and sought to reach an agreement with Sweden and the Åland islanders for fortification of those islands (see 1938 YEAR BOOK, p. 254).

On Jan. 7, 1939, the Finnish and Swedish governments agreed on final plans for defending the islands and the Diet at Helsinki later voted credits for the construction of forts there. But the work was held up when the Soviet Union objected and blocked approval of the remilitarization project by the May session of the League of Nations. However Finnish troops were sent to the islands after the outbreak of war between Germany and the Anglo-French-Polish bloc in September. Later, when Russia attacked Finland, Sweden co-operated in the defense of the Gulf of Bothnia by mining all of the waters on its side of the Åland Islands. The Finns having fortified the islands and mined the other side, the gulf was completely closed to Soviet warships.

Finland's Struggle for Neutrality. Throughout the spring and summer of 1939 the Helsinki Government collaborated with the other small democracies of northwestern Europe in efforts to prevent being dragged into the approaching European conflict. Finland, Norway, and Sweden rejected Chancellor Hitler's offer of a non-aggression pact, made before the Reichstag April 28. Their Foreign Ministers met in Stockholm May 9 and declared their determination to "keep outside all groups of powers that may be formed in Europe."

Finland likewise objected vigorously when the Soviet Government in the spring of 1939 demanded a joint Anglo-French-Soviet guarantee of the "neutrality and independence" of the Baltic states (including Finland) as the price of Russian military collaboration with Britain and France against Germany. Speaking before the Diet on June 6 Foreign Minister Erkkö said:

... Such a guarantee cannot be accepted. It is not compatible with Finland's independence and sovereignty, and Finland is bound to treat as an aggressor every power that on the strength of such a self-assumed guarantee intends to extend its so-called assistance when, perhaps, it considers the guaranteed state needs it.

The Finnish nation is determined to protect its neutrality to the bitter end. Nobody can convince us that if we, in the name of peace, should be dragged into the great powers' constellations, it could help the world or ourselves.

In the early summer of 1939, according to British sources, the Soviet Government secretly offered to conclude a mutual assistance pact with Britain and France in return for a free hand in the Baltic and the right to establish military bases in the Åland Islands, Finland and the other Baltic states. The British and French declined to conclude such a pact over the objections of the Baltic states. The Russians then turned to Germany, which agreed to these terms in return for Russian economic assistance and neutrality in the German military conflict with Britain and France.

In June Finnish alarm at the increasingly critical European situation was shown by the voluntary mobilization of thousands of university students and young militiamen to strengthen the fortifications of the Mannerheim Line and other border defenses. Voluntary contributions for the purchase of arms and supplies totaled 10,000,000 Finnish marks before the end of June.

Prelude to War. The crisis that the Finns feared began in October, after Hitler's recognition of Soviet supremacy in the Baltic states had en-

abled Moscow to commence the transformation of Estonia, Latvia, and Lithuania into military allies and virtual protectorates of the Soviet Union. On October 7 the dreaded call came to Finland to send representatives to Moscow to hear proposals for the "readjustment" of Soviet-Finnish relations. The Finnish Government dispatched a delegation headed by Dr. Juho K. Paasikivi. At the same time Foreign Minister Erkkö warned that "Finland will not sign a dictated agreement incompatible with her integrity and her neutrality. . . . The fact that Finland has sent a representative to Moscow only denotes that Finland is prepared to conduct friendly negotiations."

While anxiously awaiting news of Soviet intentions, the Finns replied to reports of Russian troop concentrations near the border by calling up about 300,000 troops to man frontier fortifications. The fleet was mobilized. Evacuation of civilians from Helsinki and other cities was begun. At the same time successful efforts were made to enlist moral support from other countries to aid Finland in resisting Soviet demands. The governments of the United States, Great Britain, Norway, Sweden, and Denmark all sent their diplomatic representatives in Moscow to the Kremlin with notes urging that the Soviet Union respect Finland's neutrality and maintain peaceful relations. On October 18-19 the Kings of Denmark, Norway, and Sweden and the Finnish President conferred in Stockholm. Their joint communiqué stressed Scandinavian unity, but no promise of military support for Finland against Russia was forthcoming.

The Russian Demands. Meanwhile the Soviet Government on October 14 had presented its demands to the Finnish delegation. They were summarized from the Finnish *White Book* of December 11 as follows:

The abolition of the fortified zones situated on both sides of the frontier between Finland and the Soviet Union, leaving frontier guards only.

The Soviet Union had no objection to the fortification of the Åland Islands by Finland provided that no foreign power—Sweden included—was concerned in their fortification.

The adjustment of the frontier in the north in the Petsamo region, where the frontier was "badly and artificially drawn."

The leasing to the Soviet Union for 30 years of the port of Hangö and the territory adjoining situated within a radius of five to six nautical miles to the south and east, and three to the north and west, for the purpose of establishing a naval base with coastal artillery capable, in conjunction with the naval base at Baltic Port (Estonia) of blocking access to the Gulf of Finland.

For the "protection" of the Hangö base Russia sought the right to "keep in the port of Hangö a garrison of one infantry regiment, two anti-aircraft batteries, three air force regiments and one battalion of armored cars, altogether to total not more than 5000 men."

The leasing to the Soviet Union the right of using the Bay of Latsoja as an anchorage for Soviet ships.

Finland to cede to Russia the five islands in the eastern end of the Gulf of Finland and that portion of the Karelian Isthmus from the village of Lippola to the town of Koivisto [near which the Finnish fighting lines were situated] as well as an area around Kalastajasareento—a total of 866 square miles. Among other things this would remove the Finnish frontier in the Karelian Isthmus, which was within gun range of Leningrad, to a greater distance.

In exchange the Soviet Union agreed to "cede to the Republic of Finland the Soviet Union's territory in the district of Repola and Porajärvi"—an area of 2134 square miles.

A strengthening of the Soviet-Finnish treaty of non-aggression with a paragraph "According to which the contracting parties undertake not to join any groups or alliance directly or indirectly hostile to either of the contracting parties."

Deadlock in Negotiations. The Finnish delegation returned to Helsinki with these proposals to consult their government. It returned to Moscow with compromise proposals, submitted Octo-

ber 23. The Finns agreed to cede Russia the islands in the eastern end of the Gulf of Finland with the exception of Hogland, which was left open for further discussion. However they firmly refused to grant the Soviet demands regarding Hangö as "inconsistent with Finland's policy of strict neutrality." The Finns also declined to abolish their frontier fortifications, as this would leave the country open to a Soviet invasion.

The Soviet Government, however, declared that its demands were "minimum" ones. Asserting that a Soviet military and air base at Hangö was "absolutely indispensable," it later offered to buy Hangö and the adjoining territory outright. The Finnish delegations, after returning again to Helsinki for instructions, returned on November 2 with a refusal to make concessions on these vital points, although accepting "in principle" almost two-thirds of the Soviet proposals. The Finnish answer had the unanimous support of Cabinet and parliamentary leaders of all parties.

The Finnish delegation continued the discussions in Moscow until November 9 without reaching an agreement. After the negotiations collapsed, they remained in the Soviet capital until November 13 in the hope that the Kremlin would moderate its demands. However Soviet authorities had already indicated their determination to force Finnish acquiescence. Beginning late in October the Russian press and radio unleashed a barrage of denunciations and threats against Finland, while Soviet military and air activities along the frontier led the Finns to expect an attack at any moment. The Finns made extensive counter-preparations, maintaining the nation on a virtual war footing at a cost of some 40,000,000 marks daily.

Outbreak of War. The "war of nerves" continued throughout November, with no sign of Finnish capitulation. On November 26 the Soviet Government charged that Finnish artillery had fired into Russian territory, killing four Russian soldiers and wounding nine others. The same evening Premier Molotov formally proposed that the Finnish Government "withdraw its troops without delay 20 to 25 kilometers farther from the border on the Karelian Isthmus, thus preventing the possibility of a repeated provocation." The Finnish response of November 27 denied that Finnish artillery had fired into Soviet territory, and suggested an investigation of the alleged incident by a joint commission in accordance with the Finnish-Soviet frontier convention. It also agreed to discuss removal of troops "by both sides to a fixed distance from the frontier."

Premier Molotov countered on the following day with a note denouncing the Soviet-Finnish non-aggression pact, concluded in 1932, on the following grounds:

By concentrating large forces of regular troops near Leningrad and thus placing under immediate threat the most important and vital center of the U.S.S.R., the Government of Finland committed a hostile act toward the U.S.S.R., incompatible with the non-aggression pact concluded between the two countries. Moreover, by refusing to withdraw its troops at least 20-25 kilometers after the villainous shelling of Soviet troops by Finnish troops, the Government of Finland has shown that it continues to maintain a hostile attitude toward the U.S.S.R., does not intend to pay regard to the provisions of the non-aggression pact and has decided to keep Leningrad under threat in the future.

On November 29 the Finnish Foreign Minister again denied the Soviet accusations and offered to submit the frontier incident to neutral arbitration. To refute the Soviet charge that Finland threatened the security of Leningrad he said his govern-

ment "is ready to settle with the Soviet Government the question of the removal of Finnish defense forces stationed on the Karelian Isthmus with the exception of frontier customs guard forces, to such a distance from Leningrad that it could not even be alleged that they threaten its security."

At 10:30 p.m. the same day the Soviet Government severed diplomatic relations with Finland and early the next morning (November 30) Soviet troops launched their invasion of Finland while Red Army planes rained bombs on Helsinki and other Finnish cities.

Finnish Cabinet Resigns. In a final effort to avert the conflict, the Finnish Cabinet headed by Premier Aimo Cajander resigned early on December 1 and a new Ministry headed by Risto Ryti was installed in a futile effort to conclude an armistice and continue the negotiations. It was a coalition of the Social Democratic, Agrarian, National Progressive, Swedish People's, and National Coalition parties, holding 189 of the 200 seats in the Diet. Excluded from the coalition were the pro-Fascist Patriotic National Movement, with 8 seats, and the Small Farmers and Åland Islanders, with 3 seats.

The Terijoki "Government." Hope of resuming negotiations with Moscow was nullified, however, when the Soviet Government on December 1 set up in the Finnish border town of Terijoki a puppet "Peoples' Government of the Finnish Democratic Republic," with Otto Kuusinen, a Finnish Communist exile who had lived in Moscow for two decades, as Premier and Foreign Minister. This regime immediately issued a proclamation calling upon the "long-suffering, toiling people of Finland" to "arise to the courageous fight against the tyranny of your oppressors and hangmen." Its program called for peace and "lasting and friendly relations with the Soviet Union," state control over large banks and industrial enterprises, state assistance to medium and petty enterprises, elimination of unemployment, reduction of the working day and house rents, summer vacations for workers, confiscation of large landed estates, exemption of peasants from payment of tax arrears, and state assistance of various kinds to workers and poor peasants.

On December 2 the Moscow authorities announced the conclusion of a 25-year pact of military alliance, mutual assistance and friendship with the Terijoki regime. The pact granted Russia all the demands the Kremlin had made upon the Helsinki government. It stipulated that "exchange of instruments of ratification will be effected in the shortest possible time in the capital of Finland—the city of Helsinki."

Thereafter the Soviet Government refused to admit that the Helsinki Government was entitled to speak for the Finnish nation. On December 3 the Ryti Government informed the Soviet Union through the Swedish Government that it was prepared to open negotiations for a peaceful settlement. It received no answer.

Foreign Assistance. In undertaking a last-ditch fight for their liberties, the Finns received moral support and substantial material aid from many governments and peoples. The governments of the other Scandinavian countries, Great Britain, and the United States sought through futile appeals and representations in Moscow to prevent the Soviet invasion. When the attack began on November 30 a great surge of indignation swept the world, with the exception of the Soviet Union and

Germany. This indignation found expression in the expulsion of Russia from the League of Nations (q.v.), after Moscow had declined to halt its invasion of Finland. The League then prepared the way for the extension of material assistance to Finland by those member states desirous of aiding the Finns.

By the third week of the war foreign volunteers, supplies, funds and money began to flow into Finland in substantial, though not decisive, quantities, especially from Sweden and Norway. Private and public contributions of foodstuffs, clothing, and other non-military supplies came from many countries. The Vatican sent funds for relief of Finnish Catholics. A large Finnish relief fund was raised in the United States under the leadership of ex-President Hoover. On December 10 the United States Government opened a \$10,000,000 credit to Finland for the purchase of "agricultural surpluses and other civilian supplies." A few days later the Finnish Government paid its regular semi-annual installment on its war debt to the United States. On December 18 it was announced that Washington had given the Finnish Government priority for the purchase of American war planes on order by the U.S. Navy.

Late in December the Allied Supreme War Council decided to supply the Finns with some arms and planes. Up to the end of the year, Sweden was reported to have supplied the bulk of the foreign arms and munitions reaching Finland. However the volunteers, arms, munitions, and planes that trickled into Finland were not believed to be sufficient to enable prolonged defense of the country against Soviet military might.

Elections, etc. The Soviet claim that the Helsinki Government was a government of "White Guard bandits and reactionary landlords" was refuted by the victory of the liberal government coalition in the Finnish elections held the first week-end in July, 1939. The Social Democratic-Agrarian-National Progressive coalition supporting Premier Cajander won a striking victory, capturing 147 out of 200 seats in the Diet, while the pro-Fascist Patriotic National Movement lost 6 of its 14 seats. Standing of the parties in the new Diet, with the previous standing in parenthesis, was: Social Democrats, 85 (83); Agrarian, 56 (53); National Coalition, 25 (21); Swedish people's, 17 (21); Patriotic National Movement, 8 (14); National Progressives, 6 (7); Small Farmers, 2 (1); Aland Islanders, 1 (1). The newly elected Diet was scheduled to convene early in 1940.

Even before the Russian attack, Finland was suffering severe economic hardships as a result of the curtailment of trade due to the Anglo-French-German war. Five Finnish merchant ships of 11,919 gross tons were sunk by belligerent mines and German submarines up to December 31. There was growing unemployment, shortages of goods, price rises, and slackening of production in many lines, forcing the government to take remedial action. One such measure was the hastening of construction of a concrete automobile highway along the Swedish-Finnish border from Kemi to an ice-free Norwegian port. This was expected to be completed by the summer of 1940.

One result of the fighting in Northern Finland was the capture by Russian troops of the Petsamo nickel mine, which the International Nickel Co., was in process of opening up. The company had spent over \$5,000,000 on mine, smelter hydro-electric plants, etc., before the war broke out and pro-

duction was to have started in 1940. Finnish troops were said to have dynamited the mine and burned all the buildings before withdrawing from the Petsamo district.

See DENMARK, ESTONIA, GREAT BRITAIN, NORWAY, and SWEDEN under *History*; UNITED STATES under *Foreign Affairs*; also BRIDGES, COMMUNISM, FASCISM, INDUSTRIAL CHEMISTRY, LEAGUE OF NATIONS, REPARATIONS AND WAR DEBTS.

FIRE INSURANCE. See *INSURANCE*.

FIRE PROTECTION. The preliminary estimate of fire losses in the United States for the year 1939 shows an increase of \$11,448,840 over a similar estimate for 1938. This change apparently reflects the slight improvement in business conditions during the year. That business conditions affect fire loss directly is again shown by the fact that losses for the last three months of 1939 run behind the losses for the same months in 1938 during which time business took a brief and sudden upswing.

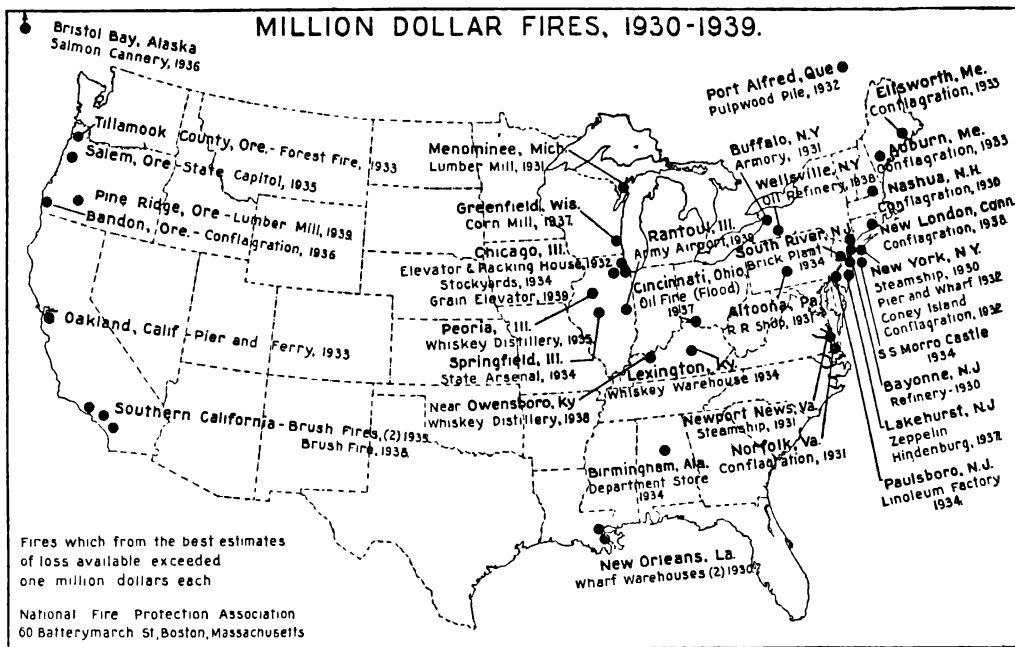

Far and away the greatest single U.S. fire loss this year was caused by the Chicago dust explosion which destroyed five grain elevators with a loss of \$3,500,000 on May 11. This fire was also fatal to nine employees. Contributing factors in this fire were wrecking of automatic sprinkler protection in the explosion, old type crib construction, and very large interior areas. The fire illustrates the reason why the prevention of dust explosions continues to demand much of the attention of fire protection engineers. The N.F.P.A. has newly published a book of 13 separate standards for the prevention of different types of dust explosions to meet a great demand.

One of the triumphs of the year was the prevention of great forest fires in the hurricane areas of the New England States. Federal and state agencies combined to provide efficient and mobile fire fighting units in these states, and though many fires started, rapid fire fighting kept any of them from burning as much as a square mile. A severe drought that occurred during the summer months made this accomplishment even more memorable.

The largest loss of life in a single fire during the year occurred in Halifax, Nova Scotia, when the Queen Hotel burned. As is usual in such fires, open stairways and elevator shafts were responsible for the rapid spread of the fire, trapping people in their rooms. Early reports of the Marlborough Hotel fire in Minneapolis on January 3 of 1940 indicate that a similar condition existed. Such tragedies are the direct result of ignoring the cardinal principles of the National Building Exits Code.

Schools of instruction for firemen continued to gain favor during 1939. Oklahoma Agricultural and Mechanical College offered, in its school of Technical Training, a special course in firemanship. The college built a special building for the course which houses modern apparatus and gives students a chance to respond to alarms and fight local fires as part of their training.

In addition, fire colleges or instructors' schools (established in most instances for advanced training or for training fire-school instructors) were held in 26 states with an attendance of 7367 men. One hundred and fifty-nine regional or district short courses which extend the training program to volunteer and part paid departments were held, with a total attendance of 9332 men. Traveling instructors in several states gave instruction to 1111 departments and 26,899 men.

From the best figures available it is estimated that \$95,522,000 damage resulted from the 41 individual million dollar or greater losses recorded during the ten years, 1930-39 inclusive. Thus the average loss from these great fires was \$2,330,000. Of the 41 fires, 23 caused losses between 1 and 2 million dollars, 11 caused losses of between 2 and 3 million dollars, 6 caused losses of 3 to 5 million dollars, and one fire caused an estimated loss of twenty million dollars.

Growing numbers of departments and men received purely local training.

Sixteen states offered definite, measured training courses this year. These courses are set up generally under the state department of education. They offer elementary and advanced training. Total number of men receiving this type of training in 1939 was 9796. It is estimated that over 70,000 firemen received some training this year.

An important part of the municipal fire protection scheme continues to be the fire prevention bureau. Such bureaus are now operating in 86 of the 95 U.S. cities of over 100,000 population and in many smaller cities. Through regular inspection work and authority to command fire prevention precautions as well as through continual fire prevention education work, the fire prevention bureaus have been a large factor in the shift of the heaviest fire loss to the rural and small town areas.

The fire breeding wooden shingle roof is now prohibited throughout the city limits of 658 cities and within the fire limits of many others.

This year the emphasis of the Fire Prevention Week Campaign was applied with increased vigor in rural and small communities. The National Fire Protection Association, the Agricultural Committee of the National Fire Waste Forum, leading farm journals, farm bureaus, 4-H clubs, and rural fire departments joined in carrying the program of fire prevention education to the rural areas. Rural fire protection districts have been organized in many areas and provided with apparatus and men for fighting farm fires. Development of farm water supplies is being encouraged.

Technical schools and colleges throughout the country are expressing interest in including appro-

priate fire-protection-engineering instruction. To aid this healthy development which should eventually provide engineers trained in fire protection for every industrial plant in the country, the N.F.P.A. has appointed a committee on fire protection engineering education. The chairman of this committee is Walter R. MacCormack, Dean of Architecture, Massachusetts Institute of Technology.

Two unique fire protection problems were offered this year in the form of the Golden Gate International Exposition, and the New York World's Fair. Temporary buildings did not justify the expense of fire-resistive construction and fire protection of the character provided for permanent buildings. Yet huge values and many lives were at stake. Both fairs provided fire departments backed by good water supply and regular municipal alarm systems. Automatic alarm systems were installed in many buildings, sprinklers in a few. Fires which started were successfully controlled through rapid response of adequate equipment.

It is reported that of the 423,000,000 acres of forest land needing fire protection, only a little more than half has thus far been brought under organized fire control. Forest fire control technology is being developed rapidly. Experimental use of foam is continuing and tests have shown that the use of certain chemicals, particularly monoammonium phosphate, materially increase the extinguishing power of water. A power tool for digging forest trenches developed recently, has been used extensively during the past year. Fire weather forecasting has been developed, and though it fails occasionally, is becoming increasingly valuable in preparing protection. See FORESTRY; CIVILIAN CONSERVATION CORPS; IDAHO.

The use of carbon dioxide for fire extinguish-

ment was further developed during the year and tests were made on large quantity application in building fires from tank trucks. The full scope of application of this method of extinguishment can be determined only by such experience as will enable a balance to be made between the cost of extinguishment and the saving effected by the more rapid extinguishment and less damage to construction and contents than would obtain with water. Carbon dioxide was successfully used as an accessory in the extinguishment of a pile of oily metal scraps and filings in Lorain, Ohio. The pile was spread with a clam-shell scoop, which was kept cool by the gas.

The 1939 Fire Loss. The preliminary estimate of the fire loss in the United States for the year 1939 is \$313,498,840. This amount is based on estimates compiled by the National Board of Fire Underwriters. It is more than \$10,000,000 greater than the 1938 preliminary loss estimate, and shows the result of the greater losses during the months from February to August.

COMPARATIVE MONTHLY LOSS ESTIMATES

| | 1937 | 1938 | 1939 |
|------------------------|---------------|---------------|---------------|
| January... | \$ 25,069,895 | \$ 27,676,337 | \$ 27,615,316 |
| February... | 28,654,962 | 26,472,626 | 29,303,520 |
| March... | 29,319,029 | 29,050,968 | 30,682,168 |
| April... | 26,663,854 | 25,616,112 | 27,061,522 |
| May... | 21,437,739 | 22,917,577 | 27,031,700 |
| June... | 19,524,765 | 19,473,617 | 24,190,700 |
| July... | 19,812,485 | 20,434,688 | 22,468,304 |
| August... | 19,767,314 | 20,821,184 | 22,800,500 |
| September... | 19,349,756 | 23,372,528 | 22,837,250 |
| October... | 21,097,670 | 24,797,624 | 24,300,500 |
| November... | 23,849,673 | 28,658,695 | 27,248,160 |
| December... | 30,172,952 | 32,758,044 | 27,959,200 |
| Total | \$284,720,094 | \$302,050,000 | \$313,498,840 |
| Adjusted loss figures. | \$254,959,423 | \$265,591,231 | (*) |

NOTE. It may be noted that the final loss figures for both 1937 and 1938 are less than the preliminary loss figures for those years. It may be assumed, therefore, that the adjusted loss figure for 1939 will also be lower than the preliminary estimate.

* Released later in year.

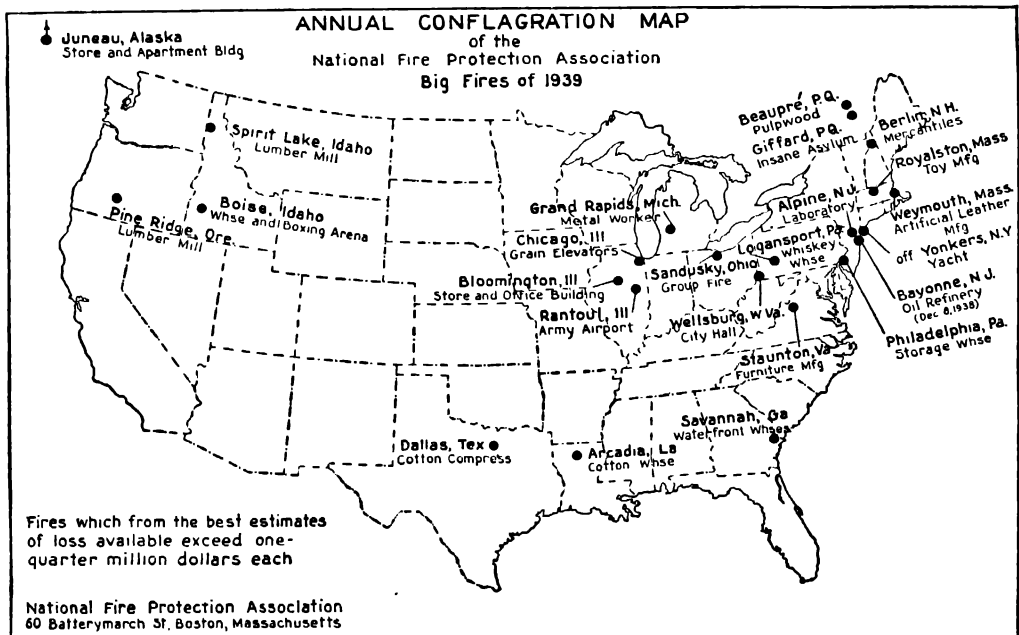

The 1939 fire loss brings the total fire waste in the United States during the past 24 years up to \$9,514,119,935, which is an annual average of about \$400,000,000. The following table gives the annual fire losses by years since 1916.

| | | | |
|------------|---------------|------------|-------------------|
| 1916 | \$258,377,952 | 1928. | \$464,607,102 |
| 1917 | 289,535,050 | 1929 | 459,445,778 |
| 1918 | 353,878,876 | 1930 | 501,980,624 |
| 1919 | 320,540,399 | 1931 | 451,643,866 |
| 1920 | 447,886,677 | 1932 | 406,885,959 |
| 1921 | 495,406,012 | 1933 | 271,453,189 |
| 1922 | 506,541,001 | 1934 | 271,197,296 |
| 1923 | 535,372,782 | 1935 | 235,263,401 |
| 1924 | 549,062,124 | 1936 | 266,659,449 |
| 1925 | 559,418,184 | 1937 | 254,959,423 |
| 1926 | 561,980,751 | 1938 | 265,591,231 |
| 1927 | 472,933,969 | 1939 | (Est) 313,498,840 |

During the year 1939 there were 21 fires in the United States each involving a loss estimated at not less than \$250,000. Included is an oil refinery fire at Bayonne, N. J. which occurred Dec. 8, 1938, but which was reported to the Department of Fire Record too late for inclusion in the 1938 tabulation of large losses. This is a decrease of 15 fires over 1938 and is nine less than the average for the past five years. Two fires in this classification occurred in Canada during 1939 and one in Alaska. The locations of these 24 large loss fires are shown on the accompanying annual conflagration map. Of these fires, 10 resulted in a loss of more than \$500,000, including 3 which caused losses of \$1,000,000 or more. The largest loss of the year was the \$3,500,000 grain elevator conflagration at Chicago, Ill., May 11, 1939.

A total of 11 lives were lost in these fires, 50 less than were lost in the large loss fires of 1938.

Legislation. The Fire Marshal of Arkansas took action to put the N.F.P.A. regulations on liquefied petroleum gas into legal effect throughout the State. This is the seventh State to give these regulations the force of law.

The model fireworks law sponsored by the Fire Marshals Section of the N.F.P.A. was adopted virtually in its entirety by the States of Indiana, West Virginia, Pennsylvania, and Delaware. Utah and California have adopted similar laws though modified to permit certain types of fireworks to be sold to the public. These six States bring the total number which have taken steps to reduce the fireworks toll of life and property to 10.

North Carolina introduced a new method of dealing with the various problems of fire department outside and mutual aid. A State-wide volunteer department was created by law. As such local departments belonging to the State organization can fight fires in any part of the State without such questions as liability for damages which arise whenever fire departments go to fires outside the corporate limits of their own community.

STRAFFORD WENTWORTH.

FISH. See BIOLOGICAL SURVEY; FISHERIES, BUREAU OF; ZOOLOGY.

FISH CULTURE. See FERTILIZERS.

FISHERIES, BUREAU OF. The fisheries of the United States rank first in value among the fisheries of the world, and second in the number of pounds taken, being exceeded only by Japan in volume of yearly production. During recent years the national fishery resources of the United States have yielded annually over 4,000,000,000 pounds of fishery products, of which about 1,800,000,000 pounds are utilized as food. The remainder, exclusive of waste, provides raw materials for a score of industries manufacturing by-products annually valued at \$37,000,000. Commercial fisheries provide a direct source of employment for approximately a quarter of a million persons; recreational fisheries furnish healthful sport for another twelve million people. The conservation of the fisheries is, therefore, a matter of greatest concern.

An important step in the development of the United States Bureau of Fisheries occurred during 1939, when the Bureau was transferred to the Department of the Interior and was placed under the direction of Secretary of the Interior Harold L. Ickes. The transfer was made under the Reorganization Plan of President Roosevelt, and was in accordance with the centralization of Federal conservation activities within the Department of the Interior.

The Bureau of Fisheries, under the administration of Acting Commissioner Charles E. Jackson, is the conservation agency to which the States look for guidance and help in conserving and replenishing the supply of food fishes, and upon which the trade depends for information and assistance. Its primary functions are in the field of biology and fish culture, and in the promotion of the economic use of the catch from ponds, rivers, lakes, coastal indentures, and on the high seas.

Current research in the fisheries includes extensive studies of the biology of fish populations for such important commercial species as the haddock, mackerel, and flounders in New England; the shad and striped bass of the Atlantic Coast; the common shrimp of the Atlantic and Gulf Coasts; the California pilchard; the Pacific salmon and herring; and the important food fishes of the Great Lakes. Many of the uncertainties and economic hazards of the fishing industry are traceable to the great annual variations in the supply of marine fishes. These studies look to-

ward stabilization of yield, an important goal of modern fishery science. Investigations also in progress are designed to encourage oyster farming along the Atlantic Coast. In addition to these projects, the Bureau's staff of technologists is constantly inquiring into methods of converting fishery market wastes into industrial products.

Within the United States, each State makes and enforces its own fishery laws, the Bureau of Fisheries acting only in an advisory capacity. In the territorial waters of Alaska, however, the Federal Government has jurisdiction over the fisheries, including the fur-seal herd of the Pribilof Islands. See ALASKA.

The fur-seal herd of these islands, which is by far the largest in the world, is under protection afforded by the Convention of July 7, 1911, entered into by the United States, Great Britain, Japan, and Russia. Through careful management of the Bureau of Fisheries the herd has grown from 130,000 animals in 1911 to about 2,020,000 in 1939. The total yield of skins, taken only from 3-year-old males, in 1939 was 60,473, a 50-year record.

The Bureau operates 110 major fish hatcheries in various parts of the country and, during the fiscal year ended June 30, 1939, distributed to suitable waters 8,094,000,000 fish and eggs of 46 different species, of which the bulk were commercial, both fresh water and marine.

The fisheries catch in Alaska, exclusive of whales, during 1938, amounted to 793,948,400 lb., valued at \$12,040,000. Salmon was by far the most important species, yielding a total of 589,706,000 lb., valued at \$9,943,000. The herring industry was next in importance, with a production of 179,735,000 lb., valued at \$899,000. The halibut industry ranked third, producing 19,366,000 lb., valued at \$981,000. Of the remaining products, clam, whale, crab, and shrimp were most important in value.

The Atlantic Coast produced 1,543,534,800 lb. of fishery products in 1937, the most recent year for which complete statistics are available. More than one-third of this came from the New England section. Fisheries of the Gulf Coast produced 230,977,200 lb. of fish and shellfish. Landings of fishery products in the Pacific Coast States, amounting to 1,576,877,000 lb., were composed principally of 1,139,505,000 lb. of sardines or pilchards. Fresh-water fisheries of the Great Lakes and the Mississippi River produced 166,341,000 lb.

CHARLES E. JACKSON.

FISK UNIVERSITY. A coeducational institution for colored people in Nashville, Tennessee, founded in 1866. The total enrollment of 461 for the autumn of 1939 included 191 men and 270 women. The faculty numbered 59. The productive endowment for 1938-39 amounted \$2,609,548, and the total income, \$386,375. The library contained 67,265 volumes. The total enrollment of 188 for the summer of 1939 included 76 men and 112 women. President, Thomas Elsa Jones, Ph.D.

FITZGERALD, FRANK D(WIGHT). An American Governor, died at Grand Ledge, Mich., Mar. 16, 1939, where he was born, Jan. 27, 1885. Educated in the public schools and at Ferris Institute at Big Rapids, Mich., in 1906 he entered the postal service, serving until 1911. He became committee clerk in the Michigan senate in 1913 and thereafter spent practically all his life in the service of the State. He was proofreader of the House of Representatives in 1915 and bill clerk in 1917. During the War he served as Federal

Food Administrator of Michigan, and in 1919 was appointed Deputy Secretary of State.

Out of office in 1921, he became general manager of the Oldsmobile Distributing Corporation at Memphis, Mich., but two years later he returned as business manager of the Michigan State Highway Department. He served as Secretary of State during 1931-34, and in 1935 was elected Governor on the Republican ticket. Defeated by Frank Murphy in the elections of 1936, he became president of the Loan and Deposit State Bank, but in 1938 he accepted the Republican gubernatorial nomination and defeated Murphy on the labor issue.

Governor Fitzgerald was credited with having launched the Michigan civil service law.

FLAX. Flaxseed production in the United States in 1939 was estimated to total 20,330,000 bu. from 2,284,000 acres as compared with 8,152,000 bu. from 936,000 acres in 1938 and 70 per cent larger than the 1928-37 average production of 11,943,000 bu. Increased production in 1939 was attributed to a greatly expanded acreage in most producing States and above average acre yields, 8.9 bu. v. 8.7 in 1938. Leading flax States were Minnesota with 12,230,000 bu., North Dakota 2,055,000, California 1,728,000, and South Dakota with 1,296,000 bu. Flaxseed growing recently has become significant in Arizona, Idaho, Oregon, Texas, and Washington. The season average price per bushel received by farmers was \$1.552 and the value of production was estimated at \$31,548,000 in 1939 compared to \$1.591 and \$12,967,000 in 1938.

The 1939-40 seed crop in other leading producing countries was for Argentina 49,211,000 bu., India 17,798,000, Uruguay 5,149,000, and Canada 2,149,000 bu. World flaxseed production in 1939 excluding the U.S.S.R. and China was estimated at 104,812,000 bu. Flax fiber production in 1938-39, 15 countries reporting, totaled about 1,697,000-000 lb.

HENRY M. STEECE.

FLOOD CONTROL. Inasmuch as the year, unlike most of those of recent record, has been free from great and devastating floods, attention has turned to a more carefully considered study of flood flows. From an historic point of view, the work of the Miami Conservancy District in Ohio some twenty years ago has long been regarded as a classic. Messrs. Fuller and Hazen also introduced the statistical method in such studies about the same time. The latter method applies to the study of flood magnitudes and the frequency of occurrence of great floods—the probability method of analysis. Due to the relatively short period for which adequate flood records are available in the United States, and to the tremendously long periods which must often be anticipated in the design of flood control works, this method has been seriously questioned, not on the grounds of its mathematical development but as to its reliability under these conditions. Various other lines of attack on this problem have been suggested and attempts have been made to estimate maximum flood volumes by so-called rational methods of analysis of rainfall and of size, shape, slope, and character of the drainage areas involved. Water Supply Paper, No. 771 of the U.S. Geological Survey, "Floods in the United States: Magnitude and Frequency" issued in 1936, summarized these various methods and has furnished the basis for much discussion, particularly during the past year.

In the meantime the flood constructions of the Federal Government under the Corps of Engineers (q.v.) have gone forward while the basic question of Federal *vs.* State rights to water powers on navigable streams and the authority of Federal agents to condemn land for flood works still remains unsettled. It is held by the advocates of Federal control that any work on a navigable stream is subject to Federal action and control and that any power developed in connection with such works is Federal property. Acting under this theory, suit has been brought against the New England Power Co. hydro-electric plant at Bellows Falls, Vt., which took over rights formerly held by a company which maintained a canal and lock system at this point as an aid to navigation on the Connecticut River. The argument is particularly warm in New England, and Vermont has refused to surrender what she considers State rights to the Federal government. The outcome will be awaited with interest.

From the standpoint of constitutional law it would appear that those States which refuse to permit the Federal authorities to undertake flood works, and to take over power developments incidental thereto, are fighting a losing battle. There are so many types of work possible under the interpretation of the implied powers of the commerce clause of the constitution, which makes the improvement of navigation a Federal duty, that there appears to be no end to what can be undertaken by Federal agencies. Apparently, therefore, Federal flood control works will go forward, whether the States like it or not, and the only ultimate recourse of its opponents will be an aroused public opinion expressed through Congress.

JAMES K. FINCH.

FLOODS. In general, the floods which occur when natural streams of inland regions overflow their banks may be grouped into two classes. One is the local type over the land bordering a small stream, which is confined to a relatively small region; if the small region is not densely populated, little damage is done, but if it is thickly settled great damage may be caused by a local flood. The other is the flood over land bordering a large stream. Both classes of floods are caused by heavy rains (occasionally supplemented by melting snow). While there is no sharp line of demarcation between the two types of floods, it may be said that: (1) The average intensity of the rainfall over the drainage area which causes a local flood must be considerably greater than that causing a flood in a large stream, before much outside public interest is attracted to the local flood; (2) local floods are of short duration, while floods in large streams may last weeks or months; (3) in the present state of the meteorological and hydrological sciences it is impossible to predict the occurrence of local floods, while floods in large streams can usually be accurately predicted, and most governments maintain services for this purpose. A seacoast sometimes experiences a flood of a third class; such floods are not due to rains, but result from the so-called tidal waves caused by earthquakes or terrific wind-storms.

Floods of both classes during the present year were unimportant compared to those occurring in an average year, though the loss of life was large. The accompanying table shows the total reported damage, and it is less than that for any year since 1934.

FLOOD LOSSES IN THE UNITED STATES IN 1939

| Drainage ^a | Reported Losses ^b | Lives |
|--------------------------------|------------------------------|-------|
| St. Lawrence..... | \$ 11,100 | 0 |
| Atlantic Slope..... | 510,610 | 0 |
| Gulf (except Mississippi)..... | 7,002,580 | 0 |
| Mississippi (except Ohio)..... | 1,512,765 | 0 |
| Ohio..... | 2,210,941 | 79 |
| Pacific Slope..... | 12,950 | 0 |
| Total..... | \$11,260,946 | 79 |

^a There were no losses reported in other Drainage Areas.

^b Probably about 75 per cent of actual.

Floods were exceptionally numerous in the United States east of the Rocky Mountains during February and March and were moderately numerous during April and May, but none of these floods reached high stages. The Ohio river was in flood during February and continuing into March, and again in April, but the stages reached were not high.

The first of these two Ohio river floods is notable for its long duration, especially in the lower reaches throughout the rainy weeks of February and March, and with memories of the great flood of 1937 still fresh in the minds of residents it caused great apprehension. In one way, however, this was of benefit, as people evacuated their homes, and removed property and livestock in ample time so that the flood damage was less in proportion to the stages reached than in most other Ohio floods.

The following table compares the duration of this flood with that of the great flood of 1937:

| | 1939 (days) | 1937 (days) |
|-----------------------|----------------|----------------|
| Pittsburgh, Pa..... | 1 | 10 |
| Cincinnati, Ohio..... | 5 | 19 |
| Louisville, Ky..... | 7 | 23 |
| Evansville, Ind..... | 48 | 41 |
| Paducah, Ky..... | 47 | 44 |
| Cairo, Ill..... | 50 | 50 |

The Ohio river flood of April was of relatively short duration.

There was a damaging flood in the Tombigbee river and its tributaries in Alabama in June. While stages were moderate, this flood, occurring as it did during the growing season, caused widespread damage. Approximately 200,000 acres were inundated, and the reported damage exceeded that for any other individual flood during the year. See ALABAMA.

A local but devastating flood occurred in eastern Kentucky in July. Very heavy rains resulting from thunderstorms during the night of July 4-5 flooded the towns of Farmers, Clearfield, Morehead, and Keck. The floods were nearly all confined to the creeks and small streams feeding the upper Licking and upper Kentucky Rivers. The topography of this section of the State is mountainous and with rains from 2½ to 9 inches in depth falling in times less than four hours, it is not surprising that the normally placid brooks and creeks became raging torrents causing much destruction to life and property. There were 79 persons drowned.

There was a serious flood in the Alabama River in August. At Selma the flood was within 2.1 feet of the highest of record. The reported damage, however, was not unusual for a flood reaching so great a height.

Most of the rivers were low at the end of 1939.

RICHMOND T. ZOCH.

FLORIDA. Area and Population. Area, 58,666 square miles; included (1930) water, 3805 square miles. Population: Apr. 1, 1930 (census), 1,468,211; July 1, 1937 (Federal estimate), 1,670,000; 1920 (census), 968,470. Jacksonville had (1930) 129,549 inhabitants; Miami, 110,637; Tampa, 101,161; Tallahassee, the capital, 10,700.

Agriculture. Florida harvested, in 1939, 1,597,100 acres of principal crops. Oranges totaled about 35,900,000 boxes (estimated farm value, \$33,615,000); grapefruit, approximately 17,100,000 boxes (\$13,959,000); corn, on 805,000 acres, 6,038,000 bu. (\$4,106,000); potatoes, 29,000 acres, 3,480,000 bu. (\$3,932,000); tobacco, 32,500 acres, 23,410,000 lb. (\$4,067,000); sugar cane (the part grown for sugar), on 21,000 acres, 736,000 tons (\$2,318,000); sweet potatoes, 19,000 acres, 1,140,000 bu. (\$912,000). The farm value of a variety of truck crops (annual growths for sale to canneries or the general market while fresh) approximated \$33,334,000 and formed one of the main sources of farmers' revenue.

Manufacturing. Florida's manufacturing establishments numbered, in 1937, 1835 (in 1935, 1889); they employed 52,005 wage-earners (in 1935, 51,412), and paid in wages \$36,501,359 (in 1935, \$30,961,300). The yearly manufactured product totaled \$217,044,982 for 1937 (for 1935, \$154,929,726); the part contributed to the total by manufacture in Florida was \$103,907,007 (in 1935, \$80,246,718). Lumber and timber products, exclusive of boxes, cooperage, etc., separately classified, attained for 1937 the total of \$29,860,617; cigars, of \$24,972,472; fruits and vegetables canned, dried, or made into preparations, \$16,220,558; fertilizers, \$14,391,737. Jacksonville, the leading source of manufactured products, attained an output of \$43,459,269 for 1937; Tampa, of \$37,170,082; Miami, \$16,532,430.

Mineral Production. Phosphate rock contributed nearly two-thirds of the total value, \$13,811,958, ascribed by the U.S. Bureau of Mines to all the native minerals that were produced in Florida in 1937.

The production of phosphate rock of all grades declined to 2,707,335 long tons for 1938, from 2,996,820 for 1937; by value, to \$8,773,680, from \$9,142,985. An inquiry made for a joint Congressional committee investigating reserves of unmined phosphate in the main producing States obtained estimates in 1938 increasing the computed supply in the State to 660,000,000 long tons of content of phosphorus in the three commercial types of rock, from the older estimate of 77,315,000 tons. Another 1,400,000,000 tons of phosphorus was reckoned to be situated in bedrock, not yet commercially used as a source.

Legislation. The regular biennial session of the Legislature opened April 4 and adjourned early in June. The members were under considerable pressure from constituencies to provide more money for public schools and other public activities without adding to the taxes. A committee had been appointed six weeks before the session, by the speaker-designate of the House, to study needs for appropriation and report thereon, but its labors brought little help. The Legislature passed, without provision for the corresponding revenue, measures adding about \$5,000,000 to biennial appropriations; in addition it repealed an existing tax of one-half of 1 per cent on gross receipts. Governor Cone, after the close of the session, vetoed both the deficit-making appropriations and the repeal of the tax on gross receipts,

thus putting the State back about where it had been before the Legislature went to work.

In other fields, the Legislators reduced a step-mother's lawful share in a decedent husband's estate to no more than that of each child by earlier marriage; defeated a proposal to give State pensions at \$200 a month to the elderly, on the Townsend plan; and allowed the demise, in a committee's hands, of a bill to require the numerous owners of cattle to fence them in and thus keep them off the automobile highways.

Political and Other Events. A decision of the U.S. Supreme Court, rendered in February, held that a charge of 15 cents per cwt. on cement imported into the State, while represented as an inspection fee, was in effect a tariff. The decision attracted attention outside of Florida, as the case resembled those of divers imposts laid by one State or another on goods coming from other parts of the Union and commonly known to compete with goods produced within the taxing State. Florida's system for regulating the charges in some kinds of trade within the State, by the agency of special boards, also was brought into the Federal courts; three dry-cleaners who had been put in jail for contempt of the State Supreme Court after refusal to comply with the minimum prices set by the State's laundry and dry-cleaning board carried their case in February to the U.S. Circuit Court; a fourth man was freed from jail by a Federal District Judge.

Dry weather in the early autumn helped the spread of costly fires in the drained lands of the Everglades, on which public bodies had spent an estimated \$11,000,000 to free them from water and make them fit for agriculture. The soil of these lands, largely peat, combustible when dry, caught from surface fires and burned deeply over areas judged to aggregate 200 square miles; the fertile top soil in some parts was wholly consumed; elsewhere it was diminished by the fire.

The estate of the late Alfred I. Du Pont completed (April 5) the payment of inheritance tax to Florida, remitting a check for \$2,927,339; previous payments had totaled \$3,635,791. The last payment extinguished a deficit of about \$2,000,000 in the State's operations for the fiscal year 1939.

New regulations for the marketing of citrus fruits, published by the Citrus Commission in August, were directed against the shipment of fruit too long before its maturity and of fruit lacking in juice or harmed by freezing weather.

In Miami, Mayor Robert R. Williams and two city commissioners, indicted in 1938 on a charge of soliciting a bribe from the Florida Light and Power Company as an inducement for them to settle a dispute over the company's rates out of court, were removed from office by a special election initiated by demand for their recall. A former Mayor, E. G. Sewell, was elected Mayor in Williams's place.

Officers. The chief officers of Florida, serving in 1939, were: Governor, Fred P. Cone (Dem.); Secretary of State, R. A. Gray; Attorney-General, George Couper Gibbs; Comptroller, J. M. Lee; Treasurer, W. V. Knott; Commissioner of Agriculture, Nathan Mayo; Superintendent of Public Instruction, Colin English.

FLORIDA, UNIVERSITY OF. A State institution of higher education for men, in Gainesville, Fla., established in 1853. In the fall of 1939 the registration totaled 3323; in the summer session of 1939 it was 2591. The faculty numbered 197. The endowment was \$262,000 and the expenditure for

instruction, research, administration, and operation was \$2,205,806. The library contained 141,975 volumes. The P. K. Yonge Laboratory School had an enrollment of 469 students, and the General College, a two-year general curriculum for all entering students, had an enrollment of 2021 students. Two new dormitories were added. President, John James Tigert, LL.D.

FLORIDA STATE COLLEGE FOR WOMEN. An institution for the higher education of women in Tallahassee, Fla., founded in 1905. The enrollment for the first semester of 1939 was 1970, with a faculty of 170 members. There were 1085 enrolled in the 1939 summer session. The income from State appropriations was \$537,500, and from other sources \$101,355. The library contains 72,645 volumes. During the summer and fall of 1939 construction was completed on four new buildings on the campus, viz.: New dormitory, Student Union Building, Infirmary, and Dining Hall. Edward Conradi, Ph.D., is President.

FOKKER, fōk'ēr, ANTHONY H(ERMAN) G(ERARD). A Dutch-American airplane designer and manufacturer, died in New York, Dec. 23, 1939. Born in Kediri, Java, Apr. 6, 1890, he was educated at Mainz Technical College. Of a mechanical turn of mind he early became interested in aviation and in 1909-10 experimented with gliders. In 1911 he built his first motor-driven airplane and became a pilot, and founded the Fokker Aeroplanbau G.m.b.H at Johannisthal in Germany. In 1913 he organized the Fokker Flugzeugwerke at Schwerin-Görries. During the World War, his German factories produced a large quantity of planes for the German air force and he invented the synchronized machine-gun propeller-mechanism which revolutionized air warfare.

After the War he fled to The Netherlands where in 1919 he organized N. V. Nederlandsche Vliegtuigenfabriek, at Amsterdam. In recent years this organization had supplied military aircraft, particularly for the Scandinavian countries. In 1922 Fokker came to the United States, where he sold to the U.S. Army Air Corps a transport, T-2, a single-engine type, in which was made the first nonstop flight across the American continent. In three years he sold over \$750,000 worth of aircraft to the United States forces. He established the Atlantic Aircraft Corporation for the manufacture of his airplanes and subsequently this became the Fokker Aircraft Corporation of America, a subsidiary of General Motors Corporation. In 1929-30 he retired as president of this organization.

In 1925 he introduced an innovation—a three-engined plane. Similar planes were used by Byrd and Bennett in their North Pole flight, by Byrd on his transatlantic crossing, and by Kingsford Smith in his transpacific and round the world flights. In late years Fokker held the European manufacturing rights to the Douglas and Lockheed air transports.

The holder of F.A.I. license No. 88, although he had not done any flying in recent years, he was the author of many technical articles and of his autobiography, *The Flying Dutchman* (1931).

FOOD AND DRUG ADMINISTRATION. Both the Food and Drugs Act of 1906 and the Food, Drug, and Cosmetic Act of 1938 governed the major activities of the Food and Drug Administration during the last fiscal year. Some of the most important public-health features of the new law, notably those dealing with

new or dangerous drugs or devices and with poisonous cosmetics went into effect immediately.

Quick action was directed against the dangerous eyelash dyes which had blinded or otherwise injured so many women; skin bleaches and freckle removers; a mole remover; lip sticks; and coal-tar hair dyes which failed to carry the required warning. All told, there were 85 seizures of poisonous cosmetics. Criminal prosecutions were instituted against the manufacturers involved.

No manufacturer may now launch a new drug in interstate commerce without first satisfying the Secretary of Agriculture that he has tested it sufficiently to know that it will not be injurious when used as the labeling directs. During the first year of enforcement, 1222 applications for new drugs were received, of which 680 were permitted to become effective. In one instance alone it was necessary to review more than 2000 case records, representing the experiences of about 100 physicians in administering the drug.

The 45 seizures of dangerous drugs during the year involved such potent ingredients as aminopyrine, cinchophen, neocinchophen, sulfanilamide, and desiccated thyroid.

For the first time dangerous therapeutic devices were subjected to regulation. Actions were taken against lead nipple shields, which had recently caused the death of at least one baby and the injury of others. As far as is known, the market has been cleared of them. Devices for spraying the nasal cavities were also seized.

During the year the Administration began work on many of the regulations required under the new law, such as the formulation of food standards and the certification of coal-tar colors.

There were fewer actions than usual against misbranded patent medicines, for the reason that they can be dealt with more adequately when the new law becomes fully effective in 1940. Then it will no longer be necessary to prove a fraudulent intent.

About the usual number of cases of food poisoning were investigated. The only proved cases of botulism were traced to under-processed home-canned foods; none to commercial packs. Airplane travel helped inspectors check Alaska salmon canneries more closely, and weather favored a pack free from spoilage. Only one criminal action was required. A campaign against lead in maple products resulted in fewer seizures than the previous year, while continued inspection of the crab-meat industry led to improvement in at least one district.

Fines totaling \$26,100 were imposed as a result of the prosecution of the manufacturer of Elixir Sulfanilamide—the largest sum levied against a single concern in the course of food and drug enforcement.

As usual the Administration carried out the provisions of the Insecticide Act, the Caustic Poison Act, the Import Milk and Filled Milk Acts, the Tea Act, and the Naval Stores Act.

FORD, FORD MADDOX. A British writer, died in Deauville, France, June 26, 1939. Born in Merton, England, in 1873, the son of Dr. Francis

Hueffer and the grandson of Ford Maddox Brown, he was educated in England, France, and Germany, and at the age of 19 published his first book, a fairy story, *The Brown Owl*. He wrote several other books and in 1900 became the editor of *The London Review*, in whose pages the work of many later famous authors first appeared. During 1897–1909 he acted as literary assistant to Joseph Conrad, and under their joint authorship were published *The Inheritors* (1901) and *Romance* (1903). In 1908, he launched *The English Review*, which had but a brief life, and after the War he edited *The Transatlantic Review*. A prolific writer, up to the time of the World War he had published some 30 books, including a *Life of Maddox Brown* and *Henry James: A Critical Study* (1914) and a novel, *The Good Soldier* (1915).

In 1919, Mr. Ford changed his name from Ford Maddox Hueffer to that of Ford Maddox Ford. Continuing his writing after the War, between 1924 and 1928 he issued a series of novels on England and the Great War: *Some Do Not* (1924), *No More Parades* (1925), *A Man Could Stand Up* (1927), and *The Last Post* (1928), his most celebrated works in this field. His biography of Conrad appeared in 1924, his autobiography, *Return to Yesterday* in 1931. In 1927 after a visit to the United States he published *New York Is Not America*. His last work was *The March of Literature* (1938), in which he described himself as "an old man mad about writing."

His works published after 1928 were *No Enemy* (1929), *The English Novel* (1930), *When the Wicked Man* (1932), *The Rash Act* (1922), *Towards Tomorrow* (1933), *It Was The Nightingale* (1934), *Vive le Roy* (1937), *Mightier than the Sword* (1938) and *Provence* (1938).

FORDHAM UNIVERSITY. A Roman Catholic Institution for higher education, under the Society of Jesus in New York City, founded as St. John's College in 1841. It is one of the largest Roman Catholic educational institutions in the country. The enrollment for 1939–40 was 7881, including 1630 in the School of Education and 833 in the Graduate School, and a distribution among the other colleges as follows: Law, 853; Fordham College (two divisions) 1671; School of Business, 589; Pharmacy, 137; Social Service, 348; Preparatory, 469. The registration for the Summer Session 1939 was 1502. Enrollment in the College of St. Andrew-on-Hudson, Poughkeepsie, N. Y., affiliated in 1936, is 42; admission to this department is limited to student-members of the Society of Jesus. There were 409 Faculty Members. The endowment fund totaled \$692,000. There were 185,000 volumes in the library. In June, 1939, St. Mary's Hall, a residence hall for Nuns attending Fordham University, was completed. It accommodates fifty student-nuns, with chapel, dining hall, recreation center, etc. and is located on the grounds of Mt. St. Ursula Academy, 198th Street and Marion Avenue, within six minutes' walk of the University. It is directed by the Ursuline Sisters for the University. President, the Rev. Robert I. Gannon, S.J.

FORD MOTOR CO. See NATIONAL LABOR RELATIONS BOARD.

FOREIGN EXCHANGE. For the par value of foreign currencies, see CURRENCIES, VALUE OF FOREIGN. For exchange rates during 1939 see INTERNATIONAL BANKING.

FOREIGN POLICY ASSOCIATION. An organization founded in 1918 with the object of

carrying on research and educational activities to aid in the understanding and constructive development of American foreign policy. The Association maintains a Research Department with a permanent staff of eleven experts, each covering a given field in international relations. A Department of Popular Education, set up in 1935, meets the demand of the general public for popular material on foreign affairs. Publications of the Association include a weekly *Bulletin*, semi-monthly *Foreign Policy Reports*, six *Headline Books* a year, four *World Affairs Pamphlets* a year, and discussion packets. Expenses are met by membership fees, sales of literature, and contributions; the budget for 1939 was \$175,000.

Monthly luncheons are held in New York City for the purpose of presenting to the public, through authoritative speakers, all sides of current international problems; attendance ranges from 700 to 1200. In addition, frequent small luncheons are given for experts. A series of afternoon lectures was held in the spring of 1939, and a luncheon series in the autumn to study more profoundly the background of international questions. The Association presents a weekly radio program over the Blue Network of N.B.C. on Sunday afternoons. At the outbreak of the European War, a special weekly radio program was devoted to an analysis of world events.

A Washington Bureau is maintained to establish contact with the State Department and other government officials and luncheon discussions are held in seventeen branch cities of the United States. A Latin-American Program, which was in preparation during 1939, will carry out on an experimental basis a number of projects toward better understanding of inter-American problems. Officers in 1939 included James G. McDonald, Honorary Chairman; Ralph S. Rounds, Chairman; Frank Ross McCoy, President; William T. Stone, Director of Popular Education and the Washington Bureau; Vera M. Dean, Director of the Research Department. Headquarters are at 8 West 40th Street, New York City.

FOREIGN RELATIONS. See UNITED STATES under *Foreign Affairs* and the various countries under *History*.

FORESTRY. As pointed out so effectively in the foreword of *Lumber Industry Facts, 1939*, published by the National Lumber Manufacturers' Association, the forests are America's greatest renewable natural resources and wood in its various uses and forms is the most versatile material of industry. The lumber industry, the oldest major American industry, is in a difficult transitional period with the great westward migration completed. The future depends on a better use of forest lands, greater knowledge of materials and their more efficient use. The part that private forestry must play in the constructive handling of the nation's forests is indicated in the 1939 Report of the Chief of the Forest Service, where it is stated that three-fourths of all the commercial forest land in the United States is privately owned. This land contains nearly three-fifths of the saw timber and furnishes more than 95 per cent of the timber now cut. Unfortunately most of the private land is not managed to yield continuous harvests of timber. Privately owned forests and problems facing the owners are major factors in the nation's forest situation. The forests do more than supply lumber and fuel. They assist in the control of floods, in preventing water and wind erosion and provide recreation to

millions of Americans. In one way or another the forests of America involve the welfare of every citizen whether he resides in the country or in the city.

Lumber Production. As estimated by the National Lumber Manufacturers' Association in its publication *National Lumber Trade Barometer* issued Jan. 8, 1940, lumber production for 1939 was 17 per cent above that of 1938. Final figures in board feet for the twelve months of 1938 and 1939 compiled by the above named association are as follows:

| Month | 1938 | 1939 |
|----------------|----------------|----------------|
| January..... | 1,436,700,000 | 1,782,200,000 |
| February..... | 1,418,600,000 | 1,637,400,000 |
| March..... | 1,820,700,000 | 1,922,700,000 |
| April..... | 1,663,800,000 | 1,968,300,000 |
| May..... | 1,759,200,000 | 2,234,900,000 |
| June..... | 1,820,000,000 | 2,251,600,000 |
| July..... | 1,821,400,000 | 2,143,400,000 |
| August..... | 2,151,300,000 | 2,400,800,000 |
| September..... | 2,159,800,000 | 2,303,100,000 |
| October..... | 2,062,900,000 | 2,362,500,000 |
| November..... | 1,820,700,000 | 2,250,300,000 |
| December..... | 1,711,100,000 | 2,001,800,000 |
| Total for year | 21,646,000,000 | 25,259,000,000 |

Lumber Trade. The export of American lumber has declined sharply in recent years, reaching in 1938, the lowest point in 40 years. Figures compiled by the U.S. Department of Commerce show an export of less than one billion board feet in 1938 as compared with over three billion feet in 1929. The greatest losses in trade have been with the Orient and with the British Empire markets. In the first instance the Sino-Japanese conflict is responsible for the decline and in the second, the British Empire preferential tariff system. Imports continued in 1939 to exceed greatly exports as shown in the following figures released by the Department of Commerce for the full year of 1939.

| | Imports | Exports |
|-----------------------------|---------------|--------------|
| Wood, unmanufactured..... | \$ 8,254,290 | \$ 3,332,709 |
| Wood, sawmill products..... | 20,049,668 | 41,212,062 |
| Wood, manufactures..... | 12,348,150 | 14,341,014 |
| Paper base stocks..... | 88,409,149 | 8,599,960 |
| Paper and manufactures..... | 126,793,442 | 31,849,234 |
| Totals..... | \$255,854,699 | \$99,334,979 |

The great difference between exports and imports lies primarily in paper and paper base stocks, which provide newsprint, wrapping paper, paper for books and magazines and other uses.

Public Forests. There was a substantial increase in 1939 in the area of forest lands owned by the nation, by states, counties, and towns. According to the report of the Chief of the Forest Service, the net area of the National Forests included on June 30, 1939, a total of 175,843,405 acres either actually owned or in process of acquisition. This acreage may be divided into approximately 134 million acres of forest land and 41 million acres of grass, browse, and alpine country. From the National Forests there was sold stumpage equivalent to 1,842,342,000 board feet, cut under the general direction of the Forest Service. In addition the National Forests provided grazing for cattle and sheep and recreational facilities for millions of citizens.

Many of the national forests are located on the watersheds of important rivers and are highly important in flood control and in insuring water supplies to the valley communities.

State holdings are estimated at approximately 19 million acres with the larger proportion in the northern States. Community forests owned by cities, towns, and counties total three million acres.

New England Hurricane. With an estimated three billion feet of fallen timber resulting from the disastrous storm on Sept. 21, 1938, New England was faced in 1939 with the problem of salvage and of fire protection. On the instruction of President Roosevelt the Federal Forest Service set up the New England Forest Emergency Organization with headquarters in Boston. With the co-operation of the Works Progress Administration and the Civilian Conservation Corps highways were cleared and fire hazards reduced along heavily travelled roads. Through the agency of the Northeastern Timber Salvage Administration substantial loans were made on salvaged timber delivered at designated points where it could be conserved and protected from rapid deterioration. Roughly 95 per cent of the timber losses were in white pine stands. Fortunately an excellent seed crop was obtained from white pine in 1939, pointing toward the ultimate restoration of the forests.

Forest Protection. Due to long drought periods accompanied by excessively high temperatures, the far western States experienced a severe forest fire season in 1939. In a lightning-caused fire on the Toiyabe National Forest in central Nevada, five Civilian Conservation Corps enrollees lost their lives while attempting to control the conflagration. Altogether, the CCC has been a most important factor in fire control in the nation's forests, by building roads in difficult terrains, construction of dams to retain water, and in actual fire suppression. The extent of this service is discussed in the Report of the Chief of the Forest Service where it is pointed out that during its brief existence the CCC has constructed more than 42,777 miles of roads and trails in the national forests. In addition this group has built 1800 lookout structures and nearly 27,000 miles of telephone lines.

The white pine blister rust continued to be a major problem in northern Idaho, eastern Washington, and in the California-Oregon sugar pine region. Despite the fact that something over two million acres has been covered in the eradication of the alternate Ribes host, there remained a great acreage of susceptible pine timberland yet unscouted. Serious outbreaks of tree killing bark beetles occurred in Idaho, Montana, Colorado, Wyoming, and Utah.

New Books. Among interesting publications of the year were the following: Green, C. H., *Trees Of The South*, (Chapel Hill, N. C.); Guise, C. H., *The Management of Farm Woodlands*, (New York, N. Y.); Marquis, R. W., *Economics of Private Forestry*, (New York, N. Y.); Perry, J. & Slauson C., *Forestry and Lumbering*, (New York, N. Y.); Schenck, C. A., *Fremdländische Wald und Parkbäume*, 3 vols. (Berlin); Westveld, R. H., *Applied Silviculture in the United States*, (New York, N. Y.).

JOSEPH W. WELLINGTON.

FORMOSA (TAIWAN). An island off the southeast coast of China belonging to Japan. Area, 13,471 square miles, including the 12 islands called the Pescadores (Boko-to) with an area of 48 square miles. Population (1936 estimate) 5,451,863. The chief towns are: Taihoku, the capital (1935 population: 278,446); Tainan (1935: 111,959); Keelung (1935: 84,978); Takao

(1935: 83,735); Kagi (1935: 72,984); Taichu (1935: 70,467). On Apr. 30, 1937, the 1115 schools of all kinds had a total of 527,955 students.

Production and Trade. Production of chief crops, in 1938, in metric tons, was: Wheat, 600; barley, 500; maize, 1900; tobacco, 2600; tea (1936), 10,800; sesame, 1300; soybeans (1937), 4300; groundnuts, 57,800; jute (1936), 9000. In 1938-39 the estimated production of rice was 1,822,000 metric tons; sugar cane, 1,461,000 metric tons. Mineral production, in metric tons, was: Coal, 1,744,000 (1936); salt, 210,000 (1937); copper ore, 4000 (1936 estimate); silver, 6200 (1934); superphosphates of lime, 23,000 (1936). In 1937 it was estimated that 3500 kilograms of gold were produced. Livestock (Dec. 31, 1937): Buffaloes, 282,101; pigs, 1,849,195; cattle, 76,341; goats, 70,384; horses, 924. In 1938 the estimated value of general imports totaled Y366,700,000; exports, Y456,400,000.

Communications. There were, in 1939, some 11,000 miles of roads and almost all of them were surfaced with gravel. In 1936, 3701 vessels (8,858,524 tons) entered Formosan ports from Japan and other countries. Daily air service to Japan Proper was inaugurated on Apr. 1, 1938.

Government. The budget for 1938-39 was estimated to balance at Y183,014,971 (yen averaged \$0.2845 in 1938). The government is administered by a Japanese governor-general (Seizo Kobayashi). See JAPAN under *History*.

FORT PECK DAM. See MONTANA.

FOUNDATIONS. Apparently no important pneumatic work was undertaken during the year but there was an interesting and continued development in the use of steel sheet pile cofferdams. Among the most unusual procedures of this type were the foundations for the bridge over the Missouri River at Brownsville, Neb. (see BRIDGES). Steel I-beams were riveted to the interlocking steel piling to stiffen the piling and permit driving 65 feet to bedrock. In this way two circular caissons, 21 ft. in diameter were formed. These caissons were not, as is usual, completely excavated. They were cleaned out to about half their depth and the upper portion was filled with concrete thus forming a solid pier and plug over the enclosed sand cylinder. As the piers are 135 ft. in total height this was a substantial saving and it was estimated that the cost was less by 18 per cent than would have been the case had the pneumatic process been used.

Another most unusual work was undertaken for the Potomac River Bridge at Ludlow Ferry, Md. Here four circular caissons were joined together to form a four-legged pier about 60 ft. high. The entire form was built in steel and, after sinking to position, both caissons and cross-walls were filled with tremie concrete. Each of the four circular caissons were flanged outward at the bottom (32 ft. in diameter reducing to 10 ft. above) thus forming a spread type base. A timber platform was prepared 56 ft. below water level on which the caisson rested. Each base fitted over a series of steel H-piles driven through holes in the timber platform. This work required particular care in sinking the caissons in the exact planned position.

Unusual caissons were also used for the Lion's Gate Bridge at Vancouver, a suspension span which was placed in service late in 1938. The two main piers (span 1550 ft.) were constructed by totally different methods, although both were so designed that pneumatic methods could be used, if found necessary, in effecting the last stages of the

sinking. In the south pier, formed of two 48-ft. diameter caissons, the rock (sandstone) was leveled off about 38 ft. below high water, and the caisson was successfully sealed to the rock surface by using tremie concrete deposited around the outside edge. It was found possible to excavate the remaining few feet of rock in the dry. A cellular, reinforced-concrete caisson 68 by 117 ft. was used for the north pier and was sunk by open dredging with orange-peel buckets. Considerable difficulty was encountered in keeping the caisson in proper position and cracks developed in the early stages of the work, but it was finally sunk by the use of dynamite under the cutting edges.

The Narragansett Bay Bridge at Jamestown, R. I., also involved a large scale cofferdam undertaking. Some 68 foundations were required, of which 29 were circular steel sheet pile cofferdams in water 12 to 70 ft. in depth.

JAMES K. FINCH.

FOURSQUARE GOSPEL, INTERNATIONAL CHURCH OF THE. See RELIGIOUS ORGANIZATIONS.

FRANCE. Area and Population. The area is 212,722 square miles. The population was estimated at 41,980,000 on June 30, 1938, as compared with 41,905,962 (domiciled) at the 1936 census. Foreigners resident in France in 1936 numbered 2,453,507 (including Italians, 887,732; Poles, 463,143; Spaniards, 410,183). Live births in 1938 numbered 612,138 (14.6 per 1000); deaths, 646,879 (15.4 per 1000); marriages, 273,903 (6.5 per 1000). Populations of the chief cities at the 1936 census were: Paris proper, 2,829,746; Marseille, 914,232; Lyon, 570,622; Bordeaux, 258,348; Nice, 241,916; Toulouse, 213,220; Lille, 200,575; Nantes, 195,185; Strasbourg, 193,119; Saint-Etienne, 190,236; Le Havre, 164,083; Toulon, 150,310; Rouen, 122,832; Nancy, 121,310; Reims, 116,687; Roubaix, 107,105; Clermont-Ferrand, 101,128.

Colonial Empire. The French colonies, dependencies, protectorates, and mandated territories occupy an area of about 45,000,000 square miles and had an estimated population of 70,000,000 in 1938. They are treated separately in the YEAR BOOK under the following individual headings:

In *Africa*: ALGERIA; CAMEROON, FRENCH; FRENCH EQUATORIAL AFRICA; FRENCH WEST AFRICA; MADAGASCAR; MOROCCO; RÉUNION; SOMALILAND; TOGO and TUNISIA.

In *America*: FRENCH GUIANA; GUADELOUPE; MARTINIQUE and ST. PIERRE and MIQUELON.

In *Asia*: FRENCH INDIA; FRENCH INDO-CHINA; SYRIA and LEBANON.

In *Oceania*: NEW CALEDONIA and DEPENDENCIES; NEW HEBRIDES; OCEANIA, FRENCH ESTABLISHMENTS IN.

National Defense. See EUROPEAN WAR; MILITARY PROGRESS; NAVAL PROGRESS.

Religion and Education. With the exception of about 1,000,000 Protestants and a few thousand Jews, the French people profess the Roman Catholic faith. At the 1931 census there were 2,286,273 persons of five years or over (7 per cent of the total) unable to read or write. The school enrollment was: Elementary (Dec. 31, 1936), 5,332,123; secondary (1937-38), 269,422; higher public instruction (July 31, 1936), 73,852.

Agriculture. About 38 per cent of the working population is directly supported by agriculture, 31 per cent by industry and 11.5 per cent by commerce. There were 50,168,000 acres of arable land (36.84 per cent of the total) in 1937. Yields of the chief crops in 1938 in bushels, except where other-

wise indicated, were: Wheat, 372,864,000; rye, 31,933,000; barley, 59,286,000; oats, 375,986,000; corn, 22,779,000; potatoes, 636,189,000; sugar beets, 7,985,000 metric tons; beet sugar, 836,000 metric tons; wine, 1,676,953,000 gal.; olives, 110,230,000 lb.; olive oil, 2,614,000 gal.; hay, sown, 9,319,000 metric tons; fodder beets, 34,492,000 metric tons. Livestock statistics for 1938 showed 15,622,000 cattle; 7,127,000 swine; 9,872,000 sheep; 1,416,000 goats; 3,012,000 horses, mules, and asses.

Mining and Manufacturing. Mineral and metallurgical production in 1938 was, in metric tons: Coal and lignite, 47,557,000; iron, 10,100,000; iron pyrites, 147,000; potash (K₂O content), 582,000; bauxite, 682,400; pig iron, 6,049,000; steel ingots and castings, 6,174,000. The output of electric power in 1938 was 13,482,732,000 kilowatt-hours. Silk production (1938) was 47 metric tons; rayon, 28,000 metric tons; alcohol (1937), 109,701,000 gal.; vessels launched, 47,700 gross tons (1938). The chief manufacturing lines (1937) in order of the number of workers employed were metal-working and machinery, textiles and textile working, foodstuffs, and wood working.

Foreign Trade. Merchandise imports for consumption and exports of French products in 1936-38 and 1929 are shown in the accompanying table. The increase shown in the franc value of trade reflects successive declines in the foreign exchange value of the franc since September, 1936.

FRENCH FOREIGN TRADE

| Year | Imports | | Exports | |
|----------------|----------------|-------------------|----------------|-------------------|
| | Million francs | Million dollars * | Million francs | Million dollars * |
| 1938 | 45,981 | 1,322 | 30,586 | 881 |
| 1937 | 42,316 | 1,683 | 23,935 | 952 |
| 1936 | 25,414 | 1,521 | 15,492 | 927 |
| 1929 | 58,221 | 2,282 | 50,139 | 1,965 |

* Conversions to dollars made at average yearly exchange rates.

The distribution of French trade by leading countries in 1937 and 1938 is shown in the accompanying table.

FRENCH TRADE BY COUNTRIES, 1937 AND 1938
(Millions of francs)

| Country | Imports | | Exports | |
|--------------------------|---------|-------|---------|-------|
| | 1937 | 1938 | 1937 | 1938 |
| Germany | 3,247 | 3,116 | 1,415 | 1,850 |
| United States | 4,000 | 5,235 | 1,535 | 1,631 |
| United Kingdom | 3,380 | 3,238 | 2,721 | 3,552 |
| Belgium | 3,057 | 3,159 | 3,145 | 4,182 |
| Switzerland | 813 | 987 | 1,446 | 1,985 |

Of the 1938 imports, foodstuffs and beverages accounted for 27.2 per cent; raw materials and semi-manufactures, 58.2; and manufactured articles, 14.6; of the exports, the classifications named above took 14.4 per cent, 32.2 per cent and 53.4 per cent respectively.

Finance. Government receipts and expenditures for the calendar years 1936 through 1939 are shown in the table on p. 287.

By June, 1939, 12,000,000,000 francs in supplementary credits had been voted over and above the budget estimates for the calendar year 1939. Actual revenue from "normal and permanent sources" in 1938, in millions of francs, as reported in the Journal Officiel in March, 1939, was as follows: Direct taxes, 9248 (2434 more than in 1937, but 119 under revised budget estimates); indirect taxes and monopolies, 37,715 (7019 above 1937 returns, but 475 under budget estimates); public domain, 498 (169 over 1937 returns but 9 under budget estimates); other receipts, 4243 (341 over

1937 returns). The 1940 civil budget estimated receipts at 79,961,183,112 francs and expenditures at 79,889,137,098 francs. The preliminary military budget for 1940 placed expenditures at 249,000,000,000 francs.

FRENCH BUDGETS, 1936-39
[In millions of francs]

| Year | Revenues | Expenditures | | Deficit |
|-------------------------|----------|--------------|---------|---------|
| | | General | Capital | |
| 1936 (actual) | 38,893 | 46,450 | 9,339 | 16,696 |
| 1937: | | | | |
| Voted | 43,482 | 48,071 | 16,026 | 20,615 |
| Est., June, 1939 . . . | 44,218 | 50,039 | 15,600 | 21,421 |
| 1938: | | | | |
| Voted | 54,776 | 54,739 | 14,219 | 14,182 |
| Est., June, 1939 . . . | 53,900 | 63,422 | 23,789 | 33,311 |
| 1939: | | | | |
| Voted | 66,388 | 66,565 | 28,035 | 28,212 |

The total public debt on Jan. 1, 1939, was 549,-801,000,000 francs, of which 386,235,000,000 was internal. The central monetary gold reserves (in old U.S. gold dollars) totaled 1,600,000,000 francs on Sept. 30, 1939. The average exchange value of the franc was \$0.0405 in 1937, \$0.0288 in 1938, and \$0.0251 in 1939. On Nov. 13, 1938, the gold stock of the Bank of France was revalued and the gold content of the franc fixed at 27.5 milligrams of gold ⁹⁰⁰/₁₀₀₀ths fine. The franc was relatively stable thereafter until September, 1939.

Transportation. The railway network comprised seven large systems in 1938 with a total mileage of 26,427. Operating receipts of the consolidated railway services were 15,565,000,000 francs in 1938; operating expenses, 17,728,000,000; deficit, 2,163,000,000. Highways and roads aggregated 393,761 miles in 1939 (see **ROADS AND STREETS**). The water-borne internal traffic (1938) was 45,-006,000 metric tons. Air France, the principal air line, with multitudinous routes, carried 91,225 paid and 13,199 free passengers and 2039 tons of mail and freight (1938). Total operating mileage of Air France was 40,563 in August, 1939. In 1938, 24,595 vessels of 15,991,071 net register tons entered French ports in the foreign trade. The leading ports in point of freight were Marseille, Le Havre, Cherbourg, Dunkirk, Rouen, Boulogne, and Bordeaux. The French merchant marine (June 30, 1938) consisted of 2,903,600 gross tons. Tonnage launched in 1938 was 47,300.

Government. The Constitution of 1875 vests executive power in the President, acting through a ministry selected by him but responsible to Parliament. Legislative power rests in the Chamber of Deputies and the Senate, the members of which jointly elect the President for seven years. The Senate has an authorized membership of 314, all 40 years or more of age and chosen by an electoral college for terms of nine years. The Chamber has an authorized membership of 618, elected by direct manhood suffrage for four years. President, Albert Lebrun (re-elected Apr. 5, 1939).

Leading members of the cabinet appointed Apr. 4, 1938, were: Premier and Minister of National Defense, Edouard Daladier; Vice-President of Council of Ministers and Minister of Co-ordination of Services of the Premier's Office, Camille Chautemps; Foreign Affairs, Georges Bonnet; Finance, Paul Reynaud; National Economy, Raymond Patenôtre; Justice, Paul Marchandau; Interior, Albert Sarraut; Military Marine, César Campinchi; Air, Guy La Chambre. For changes in 1939, see *History*.

HISTORY

For the second time within a generation France on Sept. 3, 1939, entered upon a life and death struggle with a powerful and aggressive Germany (see **EUROPEAN WAR**). The nation took up arms with virtual unanimity, with calm determination and with confidence. That they were able to do so was due primarily to the unspectacular but firm leadership of Premier Daladier. In 1938 his government had succeeded in halting the destructive cycle of economic and financial convulsions, labor disputes, political and social conflicts and cabinet overturns that had weakened France internally and forced her to follow a vacillating policy in the face of German and Italian threats and aggressions (see 1938 **YEAR BOOK**, p. 264 f.). In 1939 Daladier's Government instilled new life in the French economic system, rehabilitated its finances, mobilized the country morally and economically to meet the growing danger from across the Rhine.

Internal Politics. To meet the threat posed by the totalitarian dictatorships, the French people voluntarily consented to the increasing concentration of power in the hands of the cabinet. Subject to Parliament's veto, Daladier by the end of 1939 was exercising powers commonly associated with dictatorship.

In each instance, the extension of the Premier's authority resulted from a deepening of the European crisis. After the German occupation of Bohemia and Moravia on March 15, he obtained from Parliament on March 19 full power to rule by decree until November 30. The Chamber of Deputies approved his request by a majority of only 57 after bitter opposition from Communists, Socialists, and a few of Daladier's own Radical Socialists. The Senate readily consented, 286 to 17. During the debate on this issue Daladier declared that he had "one sole purpose, and that is to increase the strength of France, so that she may be in a position to save all the nations who want peace and liberty."

Re-election of Lebrun. The strength of the opposition to Daladier's rule was indicated by the battle that developed over the Presidential election of April 5. Daladier and his supporters sought President Lebrun's re-election by an overwhelming majority as a symbol of French unity against the Reich. But Lebrun received only 506 of the 907 votes cast by the combined Chamber and Senate, the remainder being distributed among a number of personages affiliated mainly with the Left parties, such as Ferdinand Buisson, Edouard Herriot, Marcel Cachin (Communist) and Albert Bedouce (Socialist). M. Lebrun was inaugurated for his second term on May 10.

Elections Postponed. On June 27 Premier Daladier, warning of the impending German-Polish crisis, read a Presidential decree suspending Parliamentary sessions for the rest of the summer. The Chamber approved the decision to end the session, 350 to 231, after the Premier stated that his government would maintain constant contact with parliamentary commissions, and would reconvene Parliament if events demanded it.

With the German-Polish crisis becoming steadily more ominous, the Cabinet on July 29 approved the Premier's decision to suspend the 1940 parliamentary elections and extend the life of the existing Parliament for two years. Following the outbreak of war, Daladier on September 13 announced a reorganization of his cabinet. He took over the duties of Foreign Minister from Georges Bonnet, whose administration of that office had aroused

widespread criticism. Bonnet became Minister of Justice and Georges Pernot was named to the new post of Minister of Blockade. Other appointments were: Minister of Education, Yvon Delbos; Former Combatants and Pensions, René Besse; Mercantile Marine, Alphonse Rio; Armaments, Raoul Dautry. The political complexion of the ministry was little altered by these changes. On November 1 Vice Premier Chautemps assumed the additional post of Minister of Refugees, with responsibility for the care of a million women, children, and aged or infirm men moved from danger zones near the German frontier and from Paris.

Parliament Reconvened. On October 5 formal adjournment of Parliament was decreed although the parliamentary committees remained at work. However Parliament was recalled on November 30, and presented with a bill for the extension of the Cabinet's decree powers—due to expire at midnight—for the duration of the war. A majority of the Deputies and Senators willingly ratified the measures taken by the government. But they balked at abdicating their functions for the balance of the war. After a 12-hour debate a compromise solution was approved, 318 to 175, extending Daladier's decree powers but providing that each decree must be submitted within one month for the approval of Parliament if it was in session.

No complaint was offered as to Daladier's conduct of the war, and the Premier received a stirring tribute from virtually all parties for his leadership, but the consensus of Deputies and Senators was that they owed it to their constituents and to France to advise and support the executive arm in the prosecution of hostilities. This support was evidenced during December by the unexampled speed and unanimity with which Parliament passed the 1940 civil budget and a stupendous war budget. See *Finance* above.

Daladier's Internal Program. Under the decree powers obtained on March 19, the Daladier Government carried into effect a series of political, economic, and military measures designed to mobilize the nation's moral and material resources for the struggle with the Reich.

Economic Measures. In the latter part of March decrees were issued speeding up the production of defense industries. The 40-hour week, which had been progressively modified since the Popular Front reforms of 1936, gave way to a 60-hour maximum in all basic industries, although the 45-hour-week was retained in most industries. Rates of overtime pay were severely slashed. Skilled laborers were required to work wherever the government needed them, unemployment relief being denied those who refused such jobs. Civil expenditures were reduced. On April 1 a series of new taxes were imposed to finance defense measures and to make other classes besides labor bear their share of the sacrifices needed to make France strong. Armament profits were taxed between 50 and 80 per cent in addition to normal taxation.

In May Finance Minister Reynaud carried through various Treasury operations that strengthened the Government's financial position. During the first half of September a series of decrees placed the economic system on a war basis. The government assumed complete control over foreign trade, foreign exchange transactions, and the power of requisition over capital, industry, and labor. As the weeks passed without the expected German offensive, large numbers of troops were demobilized to provide labor for the farms and for rapidly expanding war industries.

As a result of skillful use of the economic war powers assumed by the government in September, the improvement in government finances, production, and general business continued throughout the remainder of the year. Gold holdings of the stabilization fund continued to increase. The stock market remained firm. A low short-term interest rate was maintained. The repatriation of French capital that had sought refuge abroad in previous years amounted to 14 billion francs from September 3 to December 13.

Political Decrees. The Daladier Government exercised its decree powers no less vigorously in the political field. A decree of April 16 made foreigners without nationality or those benefiting from sanctuary in France subject to military conscription. Foreign associations and clubs were subjected to state control on April 18, and a week later three pro-German, separatist groups in Alsace-Lorraine were ordered dissolved. Organizations or individuals in France were forbidden to accept foreign funds for propaganda purposes, and drastic penalties were imposed on the dissemination of anti-Semitic propaganda. Emanating particularly from Nazi and Fascist groups in France, this campaign was stirring up racial prejudice and tending to weaken national unity. The government on May 6 established a censorship over foreign newspapers and periodicals entering French territory. On June 24 the circulation of bulletins, tracts, and leaflets of foreign origin was prohibited.

The government on June 9 announced its decision to end the corruption and mismanagement of the municipal affairs in Marseille by placing the city under the supervision of the state. Decrees designed to check the decline in the French birth rate were issued July 29. At the same time counter-espionage and the French propaganda services abroad were augmented. A drastic new code for checking espionage, providing the death penalty for 10 separate offenses, was issued July 30, following discovery of German spy rings with wide ramifications extending into French officialdom. On the eve of war, the government on August 28 established a tight censorship of the press, radio, moving pictures, and telephonic and telegraphic communications.

Later drastic measures were taken against the autonomist movements in Brittany and Alsace. The Breton Nationalist party, which had agitated for peace, was banned on October 21, and its leader, Francis Joseph de Beauvais, was sentenced to five years in prison on December 20. Three separatist groups in Alsace-Lorraine were ordered to dissolve (October 29). Two Alsatian autonomist deputies were arrested for "a plot against the safety of the State" on October 9 and on October 26 Dr. Karl Roos, the Alsatian autonomist leader, was sentenced to death by a military court for "delivering important military secrets to German espionage agents."

Communist Party Banned. The most drastic move made by Premier Daladier under his decree powers was the suppression of the Communist party on September 26. The party had played a leading role in the organization and legislation of successive Popular Front governments in France. In the 1936 elections it polled nearly 1,500,000 votes and elected more than 70 Deputies and 2 Senators. It had established control over several hundred local municipal governments.

The decline of the party's fortunes began on May 29 when the Socialist party's national convention voted to dissolve the working agreement

with the Communists that had been formed in 1934. The attitude of Moscow during the 1939 negotiations for a mutual assistance pact with France hurt the prestige of the French Communist party, and it received a crushing blow when the Soviet Union on August 24 signed its non-aggression pact with the Reich. Many French Communists deserted the party, but the leaders and perhaps a majority of members placed responsibility for the Nazi-Soviet pact upon the French and British Governments. Thereafter they abandoned their policy calling for firm French resistance to Nazi aggression and demanded that France conclude peace on the terms suggested by the German and Soviet Governments.

Daladier meanwhile had seized the opportunity to break the Communists' power. On August 25 the Communist newspapers *L'Humanité* and *Ce Soir* were confiscated and Communist headquarters in Paris were raided; on August 27 the two newspapers were suspended indefinitely. The Soviet invasion of Poland on September 17 aroused further anger in France and enabled Daladier to dissolve the Communist party and prohibit the publication or circulation of Communist propaganda. The move was approved by the French Socialists as well as by extreme Rightists.

Thereafter the government proceeded to purge Communists from Parliament and from all public offices. Communist-dominated municipal councils were taken over by commissions. Forty-three Communist Deputies, who formed a Workers and Peasants party after dissolution of their movement, were arrested. Warrants were issued for the arrest of Maurice Thorez and other Communist leaders, who escaped the police dragnet, on army desertion charges. Three of the arrested Communist Deputies were freed on October 25 when they repudiated a letter written by their fugitive leaders favoring acceptance of Hitler's peace terms. The remainder refused to recant and were ordered held in prison indefinitely. The drive on Communists was continued throughout the year, and extended to pacifists and others who adopted a defeatist attitude toward the war.

Military Measures. Under its newly won decree powers, the government late in March assumed power to call up reservists without parliamentary approval and to increase the size of the professional army. Some 200,000 special fortress troops were called up for service in the Maginot Line. Thereafter the number of men under arms was gradually increased and effective measures taken on all fronts to enable France to withstand the expected shock of a military invasion accompanied by devastating air raids. All French land, sea, and air forces were unified under the command of Gen. Marie Gustave Gamelin on June 6. Successful efforts were made to speed up production of military planes, and large orders for additional planes were placed in the United States. Air raid shelters were constructed in Paris and other exposed centers. When the crisis reached its climax with the German invasion of Poland the evacuation of children and other non-combatants from frontier districts and Paris was carried out efficiently and smoothly.

While France's expertly-led, well-trained army stood guard on the Maginot Line, the government concentrated all its efforts upon the development of war industries and the more effective co-ordination of the nation's human and material resources to withstand the coming test. Late in December Premier Daladier announced that 950,000 workers

were engaged in making arms, munitions and supplies for the French armed forces. The army itself was busily engaged in extending and strengthening the frontier fortifications, which were extended along the entire Belgian frontier to the English Channel before the end of 1939. The government took severe measures to end defeatism and shirking. The last months of the year found the nation hard at work and more united than ever in its determination to see the war through to victory. Life in Paris and in most other cities had returned almost to normal, but over the entire nation hung the constant threat of mass German air raids and of a sudden powerful assault upon the Maginot Line.

Foreign Relations. The international position of France at the beginning of 1939 was full of danger. Daladier's repudiation of the Czech alliance in September, 1938, dealt the final blow to the chain of French alliances that had served to curb Germany's expansive energy. Italy, working in close collaboration with the Reich, was openly threatening France's possessions and power in North Africa and the Mediterranean. The impending triumph of General Franco's insurrection in Spain, based upon German and Italian military aid, threatened to draw Spain into an alliance with the Fascist powers, and thus expose France to danger of assault on three separate frontiers.

Meanwhile Japan was expanding steadily southward in the Far East, endangering the French hold on Indo-China. Against these adverse circumstances, France could balance only her increasingly close military and political co-operation with Great Britain. However Hitler's rapprochement with Communist Russia in August and Anglo-French diplomacy and economic power succeeded in separating Italy and Spain from Germany, at least temporarily. This enabled France during the first phase of the European War to concentrate the bulk of her armed might on the German frontier.

Relations with Italy. In December of 1938 Italy's repudiation of the Mussolini-Laval agreement of 1935 and Italian territorial demands upon France had brought relations between the two countries near the breaking point (see 1938 YEAR BOOK, p. 267). During the first week of January, 1939, Premier Daladier visited Corsica, Tunisia, and Algeria to inspect military preparations and defenses against a possible Italo-German attack. Everywhere he received a warm welcome from Arabs and French alike. He returned to Paris on January 8, declaring that "all our colonies want union with France, and we must give them an example by working methodically."

To the growing Italian pressure, Premier Daladier offered firm opposition. Reports that Italy was concentrating troops in Libya along the Tunisian frontier were answered by France's reoccupation on February 18 of a strategically-placed strip of coastal territory between French Somaliland and Italian Eritrea that had been ceded to Italy by France under the now invalid 1935 agreement. On March 25 Mussolini for the first time officially formulated Italian territorial demands upon France by stating that they "have a name. They are called Tunisia, Djibouti and the Suez Canal." Daladier replied on March 29 that France "would not refuse to examine propositions that may be made to her" in the spirit of the 1935 accord, but declared: "We will not cede a foot of our land nor one of our rights."

Mussolini, not being prepared to carry his

threats to the point of war, was forced to postpone his claims upon France. But his rape of Albania, a predominantly Moslem state, in April made the task of wresting Tunisia from France all the harder. It aroused deep anger among Moslem chiefs and religious leaders throughout French North Africa, and strengthened their loyalty to France. Further defiance of Italy was expressed on June 7 when the directors of the Suez Canal Company, meeting in Paris, temporarily rejected Italian demands for a voice in the canal's management.

The outbreak of the European War in September, and Italy's non-intervention policy, placed Mussolini in a far better bargaining position with respect to France. Negotiations for the satisfaction of Italy's demands continued throughout the year with no outward evidence of reaching a conclusion satisfactory to both sides. The Italian press periodically threatened to take by force what France was not prepared to yield voluntarily, but the danger of a Franco-Italian conflict did not appear as near at the end of 1939 as at the beginning of the year. In anticipation of a possible colonial conflict, the French Government in October announced a series of reforms extending greater autonomy to the colonies, which had rallied to the French cause against Germany no less effectively than in 1914.

France and Spain. Simultaneously with the negotiations with Italy, France successfully carried through the crucially important task of preventing Italy and Germany from capitalizing on their interventions in Spain. When the year opened, with Franco's Catalanian offensive making rapid headway, Daladier rejected demands from both the Left and even some Rightist spokesmen in Parliament that his government lend aid to the hard-pressed Loyalists in order to prevent the threatened Fascist encirclement of France. Instead he gambled on the chance that Spain's exhaustion, combined with Anglo-French diplomatic and military pressure, could prevent Spain's participation in an Italo-German alliance. The success of his policy was evidenced when General Franco declared Spain's strict neutrality in the Anglo-French-German war. Negotiations for the resumption of commercial relations between France and Spain were approaching a successful conclusion at the end of 1939. See *SPAIN* under *History*.

The problem of the 500,000 Loyalist refugees who fled into France before Franco's advancing armies in the spring remained to plague the Daladier Government. Large sums were required to provide them with elementary necessities in the camps in which they were assembled. Many of the refugees returned to Spain after the civil war ended, but about 130,000 remained in France at the end of 1939 as against only 20,000 who had found their way to other countries.

Co-operation with Britain. The effectiveness of Anglo-French diplomatic and military co-operation was demonstrated early in 1939 during the crisis in French relations with Italy and Spain. This collaboration was steadily extended during the remainder of the year. Toward the end of March President Lebrun, accompanied by Foreign Minister Bonnet, paid a state visit to London to return the visit of the British sovereigns to Paris in 1938. Discussions held during the visit tightened the Anglo-French military alliance. Thereafter France followed the British lead in scrapping the policy of appeasing Hitler and establishing a "stop-Hitler" front.

Through British initiative, the French alliance with Poland was reconstituted. France joined Brit-

ain in guaranteeing the independence of Greece, Rumania and Turkey. On June 23 France concluded a military accord with Turkey which provided for cession of the Sanjak of Alexandretta (Hatay Republic) to the Turks. This further alienated the Syrian nationalists in the French Near Eastern mandated territories, but led to the Anglo-French-Turkish military alliance of October 19, which greatly strengthened the French military position in the eastern Mediterranean. Beginning in September, France assembled large armed forces in Syria and their commander, General Weygand, prepared in collaboration with the Turkish army and British forces in Palestine and Egypt to meet a possible German or Soviet drive into the Balkans or the Near East.

With the declaration of war against Germany, France and Britain proceeded to extend their joint action in the economic and military fields. A Supreme War Council was established to unify their military activities. Military forces were placed under French command, naval forces under British command. At a meeting of the Supreme War Council on November 17, Anglo-French committees were established under the direction of a Supreme Economic Council to secure common action in providing airplanes and munitions, raw materials, oil, food and shipping, and in prosecuting economic warfare against the Reich. They undertook to co-ordinate industrial production and use of raw materials in the two countries, avoid competition in purchases abroad, and equalize hardships caused by the reduction of imports. The Allied merchant fleet was placed under British command.

On December 12 the two governments agreed to keep their exchange rates fixed at 176.5 francs to the pound and to pool their extensive foreign assets. They bound themselves not to raise foreign loans or credits without each other's consent and to share the burden of financial assistance to other allies, such as Poland, on the basis of 40 per cent by France and 60 per cent by Britain. To reduce the supplies available to Germany in the Balkans, France joined Britain in concluding trade pacts or making heavy purchases in Yugoslavia, Bulgaria, Greece, Rumania, and Italy.

The Japanese Menace. Joint measures were also taken for the defense of French and British colonial possessions in the Far East against Japanese aggression. After Japan seized Hainan Island from China on February 9 and on March 31 seized the Spratly Islands between Borneo and French Indo-China, annexed by France in 1933, the Paris Government protested to Tokyo and retaliated by reopening Indo-China frontiers to the passage of military supplies for the Chinese armies. In May a French military mission arrived in Chungking to advise Gen. Chiang Kai-shek. Work on the French defenses in Indo-China was speeded, particularly on the newly developed naval base at Cam Ranh. In June an Anglo-French defense conference was held in Singapore, where plans were laid for co-ordinating their naval, military, and air forces in the Far and Middle East. New friction with Japan developed in December when the French-owned railway from Hanoi to Kunming was damaged by Japanese air raids.

The Conflict with Germany. In his speech before the Chamber of Deputies on March 17 asking decree powers for his government, Premier Daladier stated that Hitler's seizure of Bohemia and Moravia two days before had nullified the Munich Accord and the Franco-German friend-

ship pact of Dec. 6, 1938 (see 1938 YEAR BOOK, p. 266 f.). The Premier reflected the mood of the nation in indicating that since the Munich concessions had failed to satisfy Germany, France must halt further Nazi aggressions lest they deprive her of her remaining ally and render the French empire too weak to resist German and Italian demands.

Pursuance of this policy led to reaffirmation of the Franco-Polish alliance and the French declaration of war on the Reich on September 3 after Hitler had ignored the Anglo-French ultimatums to withdraw his troops from Poland (see GERMANY, GREAT BRITAIN, and POLAND under *History* for the events leading up to war). On August 25 Premier Daladier in a radio appeal to the nation made it clear that France would support Poland in resisting any attempt by Germany to force acceptance of its demands. Before war began, the French position was reiterated in notes and diplomatic representations in Berlin. During these critical days German diplomacy made a strenuous effort to divide France from Britain by asserting that the Reich had no quarrel with France and no claims to make upon her. The attempt failed.

French War Aims. In Premier Daladier's reply of October 6 to Hitler's peace proposals and in President Lebrun's response of November 12 to the mediation efforts of the Belgian and Dutch sovereigns, the French Government took the stand that there could be no peace with Germany "except by reparation of the injustices which force has imposed on Austria, Czecho-Slovakia and Poland. Neither can it be established unless effective political and economic guarantees assure in the future respect for the liberty of all nations."

In a Christmas Eve broadcast Premier Daladier went further and said that "exact count will be kept of the destructions that she (Germany) causes. She will, if it becomes necessary, pay for all she does." On December 29 he told the Senate that France and Britain, having pooled their resources, looked forward to the maintenance and extension of that principle when peace came. "I conceive," he said, "that the new Europe should have a wider organization than that which has existed until now. Commercial exchange must be multiplied, and perhaps federative bonds envisaged between the various European states."

Aid to Poland and Czecho-Slovakia. France demonstrated her determination to fight until Poland and Czecho-Slovakia were restored as independent nations by recognizing their governments in exile, permitting the Polish provisional regime to establish its capital on French soil, and advancing loans, equipment, and facilities for the organization of Polish and Czecho-Slovak armies in France. A 600,000,000-franc loan was advanced to Poland on September 7.

FRANCO, GEN. FRANCISCO. See SPAIN under *History*.

FRANKFURTER, FELIX. See SUPREME COURT.

FRANKLIN, PHILIP A (LBRIGHT) S (MALL). An American industrialist, died at Locust Valley,

L. I., N. Y., Aug. 14, 1939. Born in Ashland, Md., Feb. 1, 1871, he was educated in the public schools there, and in 1889 joined the Atlantic Transport Co. in Baltimore as an office boy. Transferred to the New York office in 1891, in 1902 he was elected president of the company. Upon the formation of the International Mercantile Marine Co., he became a vice president in this organization in 1916 and in 1921 was elected its president. He served as such until January, 1936, when he was made chairman of the board of directors. He resigned this position on Jan. 1, 1939, but retained his directorship in an advisory capacity.

Under his direction, the International Mercantile Marine Co. got rid of the White Star, the Red Star, and the Leyland Lines which it had operated for some years. For forty years a power in the shipping industry, he had direction of the United States Lines, the Panama Pacific Line, the American Merchant Line, and also operated for the U.S. Government the American Pioneer Line. Mr. Franklin made every effort to further the merchant marine of the United States and is credited with building up the United States Line by his introduction of the cabin liners *Manhattan* and *Washington*.

During the World War he served as chairman of the Shipping Control Commission of New York (Feb.-Dec., 1918) and also was a member of the Export Control Committee. For his services he received the Distinguished Service Medal.

FREEMASONRY. Activities. Architectural. The Missouri Grand Lodge has appropriated funds for a Masonic memorial at St. Louis (whence their expedition started) to the famous explorers, Lewis and Clark, both of whom were members of St. Louis Lodge, No. 111, Lewis having been its first master.

Cornerstones were laid:

February 1, of the new high school building at McAllen, Tex., under Grand Lodge auspices; *February 6*, of the Missouri State Teachers' College, Field House and Auditorium at Springfield, by the State Grand Lodge; *March 4* of the Trinity Heights M. E. Church at Dallas, Tex., under Grand Lodge auspices; *May 1*, of the high school building at Frederick, Md., by the local lodge; *June 8*, of the new Scottish Rite Temple in Washington, D. C., by the latter's Grand Lodge; *June 10*, of the Sullivan Co., Court House at Milan, Mo., by the State Grand Lodge; *June 16*, of the new grade school building at Liberty, Mo., by the State Grand Lodge; *July 8*, of the new high school building at Lufkin, Tex., by the State Grand Lodge; *August 11*, of the new Harrison County Court House by the Missouri Grand Master, assisted by other State Grand Masters; *August 31*, of the new Masonic Temple at Boonville, Mo., by the State Grand Lodge; *September 5*, of the old city Hall (relaid) at Charleston, S. C., by the State Grand Lodge; *September 16*, of the new U.S.P.O. at Savannah, Mo., by the State Grand Lodge (which has laid, altogether, 20 cornerstones during the year); *September 20*, of the Buchanan Co. Court House at Independence, Ia., by the State Grand Lodge; *October 5*, of the new Washington County Court House at Brenham, Tex., by the State Grand Lodge; *October 7*, of the new \$1,000,000 Transportation Building at Olympia, Wash., by the State Grand Lodge.

Dedication of Argus Lodge Temple at Canfield, O., took place on January 27; of the new \$250,000 Masonic Temple at Marquette, Mich., on September 8, under Grand Lodge auspices.

Relief. Secretary Smith of the Masonic Relief Association of United States and Canada, reported employment found for 15,666 persons in 1938 yielding an income of \$146,676. The St. Louis Masonic Employment Bureau, oldest of its kind in the country, placed 893 in positions during the year ending June 30, 1939 and the San Francisco Masonic Employment Service, organized 1911,

placed 1591 for the year ending July 31. The *Bureau de Secour* of Paris, under the direction of Grand Commander René Raymond of the French Supreme Council, made heroic efforts to relieve the distress of oppressed Masons in other European countries.

Anniversaries. Among anniversary celebrations for the year or not previously reported were:

Aug. 11, 1938, centenary of South Australian Masonry celebrated by Friendship Lodge, No. 1 at Adelaide.

Oct. 5, 1938, jubilee celebration of New South Wales United Grand Lodge, at Sydney, witnessed by some 6000 Masons, including representatives of all antipodean grand lodges with which it maintains fraternal relations.

Jan. 30, 1939, opening of golden jubilee of Duluth Scottish Rite bodies (membership, 16,200).

June 15, Sesquicentennial of Royal Oak Lodge, No. 190, London, active in forming the United Grand Lodge of England.

June 19-21, North Dakota Grand Lodge, Golden Jubilee Communication, with representatives present from many grand lodges of the United States and Canada.

October 10, Phalanx Lodge No. 31, of Charlotte, N. C., observed its 160th anniversary, with governors of three states on the program.

October 15, 33d, anniversary of Masonic and Eastern Star Home at Washington, D. C.

November 2, bust of Dandiel D. Tompkins, 6th Vice Pres. of U.S. and 1st Gr. Commander, Nor. Supr. Council, unveiled in New York Church of St. Mark's in the Bowwerie.

November 9, golden jubilee of Scottish Rite Consistory and Council at Richmond, Va., celebrated.

Anti-Masonry. Czechoslovakia. On May 20, a house in Prague which afforded the headquarters of four Masonic lodges, was wrecked by a violent explosion.

Italy. The first of a series of exhortations in Premier Mussolini's Pronouncement from the balcony of his palace at Rome on September 23 was: "Clean out the little corners where the remnants of Masonic Jews are still found."

Egypt (now aligned with the democracies at war) seems to be one exception to the list of autocratic governments which have long been conducting a crusade against Freemasonry. King Farouk is reported as taking an active part in reuniting rival grand lodges and his uncle, Hussein Sabra Pasha, is Grand Master of the new National Grand Lodge, whose official divan includes other government notables.

Assemblies, Conferences, Conventions, ETC. (National and International):

February 22, annual meeting of George Washington Masonic Nat. Memorial Assoc. at Alexandria, Va.

February 23, annual meeting of Masonic Service Ass'n., at Washington, D. C.

February 24, 25, Annual Grand Masters' Conference at Washington, D. C. (See *Ia. Grand Lodge Bulletin*, April, 1939).

May 25-27, annual meeting of National Sojourners at San Francisco.

June 26-29, annual session, Imperial Council, Nobles of the Mystic Shrine, at Baltimore; the night parade on June 28 found 12,000 "Nobles" in line, with numerous bands of music and 32 members of Abu Bekr Temple (Sioux, Ia.) Patrol, all mounted on milk white Arabian steeds, bred specially for such service, owned and equipped by their riders. Walter D. Cline of Wichita Falls, Tex. (once its Mayor), was elected Imperial Potentate and among the officers re-elected was Governor Price of Virginia, who has long served as Imperial Recorder. Wm. L. Hein, of Lu Lu Temple, Philadelphia, was appointed Imperial Outer Guard and thereby placed in line for the highest post, which, however, he can hardly reach within a decade.

July 18-21, "Special Meeting of the United Grand Lodge of England," in London, and installation (July 19) of the Duke of Kent as Grand Master, by his brother King George VI, Past Grand Master of Scotch Masons; representatives present from 18 American and other oversea grand lodges.

July 25, special meeting of French Supreme Council, at Paris, to receive visitors from other Supreme Councils and consider plans for relieving distress of persecuted Masons in totalitarian countries.

September 12, 13, annual session of Canadian Supreme Council at Ft. William, Ont.

September 19-21, 23rd. biennial session of Masonic Relief Ass'n. of U.S. and Canada at New York City.

September 26-29, 127th annual session of Northern Supreme Council at Boston.

September 23, opening of International Conference at Boston; only three sessions were held as but four Supreme Councils, all in the Western Hemisphere, were represented by their own members.

October 15-20, Mother Supreme Council Session at Washington, three active members were elected and 75 received the 33° honorary.

October 23, 24, triennial session of General Grand Council, Royal and Select Masters, at Charleston, S. C.

October 25, 26, triennial convocation, General Grand Chapter, Royal Arch Masons, also at Charleston.

Membership. Nearly 5000 lodges (of which about ¼ are in London) with an average membership of 80, comprise the constituency of the United Grand Lodge of England. In the United States (with 50 grand lodges) which have the largest membership, there were, in 1938, (the latest figures) 15,630 lodges with 2,521,651 members; in Canada, 9 grand lodges, 1380 lodges, and 171,677 members; in Australia, 6 grand lodges, 162,031 members; in New Zealand, 25,788 members. Reliable statistics from other countries are unavailable owing to war conditions.

C. SUMNER LOBINGIER.

FRENCH CAMEROON. See CAMEROON, FRENCH.

FRENCH CONGO. See FRENCH EQUATORIAL AFRICA.

FRENCH EQUATORIAL AFRICA. A French colonial territory, comprising the colonies of Gabun (93,219 sq. mi.; pop., 409,739); Chad (461,202 sq. mi.; pop., 1,432,555); Middle Congo (166,069 sq. mi.; pop., 746,605); Ubangi-Shari (259,388 sq. mi.; pop., 833,916). Total area, 979,878 square miles; total population (1937 estimate), 3,422,815. Chief towns: Brazzaville, the capital, 4000 inhabitants; Fort Lamy, 6000; Libreville, 4500; Bangui, 13,500; Port Gentil; Pointe-Noire. In 1937 there were 18,952 pupils enrolled in the 203 schools.

Production and Trade. The natural resources of the country are undeveloped. Many species of trees of industrial value, including wild rubber, grow in tropical forests having a total area of some 300,000 square miles. Cotton (9100 metric tons in 1938), groundnuts, maize, coffee (1900 metric tons in 1938), sesame, palm oil (6500 metric tons, 1938) and kernels (6900 metric tons, 1938), cacao, wild rubber, copper, zinc, lead, ivory, and gold (40,028 fine ounces, 1938) are the chief products. In the colony of Chad, large numbers of cattle, sheep, asses, camels, horses, and ostriches are raised. In 1938 (in old U.S. gold dollars) merchandise imports were estimated at \$5,000,000 (\$7,600,000 in 1937); merchandise exports at \$5,200,000 (\$7,200,000 in 1937). A railway connects Brazzaville with Pointe-Noire on the Atlantic, a distance of 318 miles.

Finance. The system of government introduced by the decree of June 30, 1934, allows only a general budget for the whole of French Equatorial Africa, and no individual budgets for the colonies. Local revenues are obtained mainly from customs duties; there are native poll taxes. The budget for 1938 was balanced at 224,629,000 francs (franc averaged \$0.0288 in 1938).

Government. According to the decree of June 30, 1934, French Equatorial Africa was consolidated into a single administrative unit under a governor-general aided by an administrative council and a secretary-general who assumes control

during the governor-general's absence. Governor-General, J. F. Reste (appointed March, 1936).

FRENCH GUIANA (gê-â'nâ) AND **ININI**. A French colony in South America. Area, about 34,740 square miles; population (1936), 30,906. Cayenne, the capital, has 11,704 inhabitants, the other 14 communes have a total of 11,994 persons exclusive of the penal settlement of Maroni, the floating population of miners without fixed residence, and officials, troops, and native tribes. There are three ports—Cayenne, St. Laurent-du-Maroni, and Oyapoc.

Production and Trade. Rice, maize, manioc, cacao, coffee, and sugar cane are the main crops. The forests are rich in timber and commercial gums. Gold mining (40,637 fine ounces in 1938) is the main industry. In 1937 imports were valued at 52,708,646; exports at 36,853,999 (the franc averaged \$0.0405 in 1937). In 1939 there were 203 miles of roads.

Government. The budgets for French Guiana and Inini in 1937 were balanced at 17,704,755 and 3,329,542 francs respectively. A governor administers the colony aided by a privy council, and a council-general elected by the French residents of the colony. One deputy represents the colony in the French parliament. By the Decree of July 6, 1930, French Guiana was divided into two independent divisions—the coastal division remained French Guiana and the interior was named Territory of Inini.

FRENCH GUINEA. See **FRENCH WEST AFRICA**.

FRENCH INDIA. The colonies of France in India, consisting of Chandernagor, Karikal, Mahé, Pondichéry, and Yanam. Total area, about 196 square miles; population (1936 estimate) 300,000. Pondichéry (capital) had 50,209 inhabitants (1937 estimate). The chief products (with 1936-37 production figures, in metric tons, in parentheses) are: Rice (23,700); groundnuts (\$200); and manioc. In 1938 the estimated value of general imports (in old U.S. gold dollars) was \$1,700,000 (\$1,900,000 in 1937); exports, \$3,000,000 (\$3,400,000 in 1937).

The local budget for 1937 was balanced at Rs3,240,936 (rupee averaged \$0.3733 in 1937). The colonies are administered by a governor (nominated by the President of France) aided by an executive council of 5 members and an elective general council of 28 members. In the French parliament the colonies are represented by a senator and a deputy.

FRENCH INDO-CHINA. A French dependency in southeastern Asia comprising the divisions shown in the accompanying table.

| Division | Sq. mi. | Pop. (1936) | Capital |
|--------------------------------------|---------|-------------|--------------------|
| Annam ^a | 39,758 | 5,653,200 | Huê |
| Cambodia ^a | 67,550 | 3,047,100 | Pnom-Penh |
| Cochin China ^b | 26,476 | 4,618,600 | Saigon |
| Kwangchowang ^c | 200 | 200,000 | Fort Bayard |
| Laos ^a | 89,320 | 1,010,800 | Vientiane |
| Tonkin (Tongking) ^a | 40,530 | 8,699,500 | Hanoi |
| French Indo-China..... | 263,834 | 23,229,200 | Hanoi ^d |

^a Protectorate. ^b Colony. ^c Also known as Kwangchow. Leased from China for 99 years in 1898 (territory increased in 1899) and placed under the authority of the Governor-General of French Indo-China. ^d The capital city is Hanoi, but during certain seasons of the year, when climatic conditions are oppressive, the government offices move to Saigon.

Chief towns: Hanoi, the capital, 145,491 inhabitants (1938); Binh-Dinh, 147,199 (1931); Cholon, 145,254 (1936); Haiphong, 122,000;

Saigon, 111,000 (1936); Pnom-Penh, 102,678 (1936); Tchékam, 35,000 (1935); Vientiane, 28,000 (1931); Battambang, 22,000 (1931); Huê, 33,222 (1934); Fort Bayard, 12,000 (1935). In 1937 the 6687 primary, secondary, and professional schools (exclusive of many private schools) had a total of 467,020 students; the university of Hanoi had 612 students.

Production and Trade. The output (in metric tons) of the chief products for 1937-38 was: Rice, 6,308,500; maize, 623,000; rubber, 5900; cane sugar, 42,700; tobacco, 12,300; groundnuts, 16,300; copra, 11,100; coffee, 2600 (2200 in 1939); cottonseed, 2700; sesamum, 3000; cotton, 1200; tea, 11,000; coal, 2,348,000; phosphates, 43,000; zinc, 4500; manganese, 1100; salt, 180,000; tin, 1600. The production of alcohol in 1938 totaled 11,438,604 gallons (U.S.). Gold produced in 1937 totaled 9870 fine ounces. In 1938, excluding bullion and specie, imports were 1,916,700,000 francs; exports, 2,844,800,000 francs (franc averaged \$0.0288 in 1938).

Communications. There were, in 1938, 22,270 miles of highway and 2087 miles of railway line of which 1565 miles belonged to the government. Air services are operated between Saigon and Batavia (Netherlands Indies); Hanoi and Vientiane; Saigon and Bangkok (Siam). There is a radio-telephone service to Europe from Saigon.

Government. The government for the whole of French Indo-China is administered by a governor assisted by a secretary-general, a government council, and a grand council for economic affairs. Cochin China, which is a direct French colony, is headed by a governor aided by a colonial council, and each of the four protectorates is headed by a resident-superior assisted by a protectorate council and a council of economic affairs. Governor-General, M. Jules Brévié (appointed Sept. 13, 1936).
